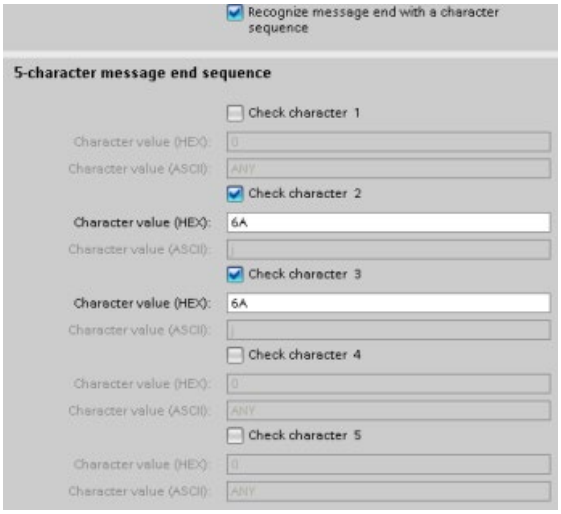
- <any character> 6A 6A
- 6A 12 14 18 1C
- 6A 44 A5 D2 1C

Message end conditions

You also configure how the communication interface recognizes the end of a message. You can configure multiple message end conditions. If any one of the configured conditions occurs, the message ends.



For example, you could specify an end condition with an end of message timeout of 300 milliseconds, an inter-character timeout of 40 bit times, and a maximum length of 50 bytes. The message will end if the message takes longer than 300 milliseconds to receive, or if the gap between any two characters exceeds 40 bit times, or if 50 bytes are received.

Parameter	Definition
Recognize message end by message timeout	The message end occurs when the configured amount of time to wait for the message end has expired. The message timeout period begins when a start condition has been satisfied. The default is 200 ms and the range is 0 to 65535 ms.  ① Received characters ②Start Message condition satisfied: message timer starts ③ Message timer expires and terminates the message
Recognize message end by response timeout	The message end occurs when the configured amount of time to wait for a response expires before a valid start sequence is received. The response timeout period begins when a transmission ends and the CM or CB begins the receive operation. The default response timeout is 200 ms and the range is 0 to 65535 ms. If a character is not received within the response time period, RCVTIME, then an error is returned to the corresponding RCV_PTP instruction. The response timeout does not define a specific end condition. It only specifies that a character must be successfully received within the specified time. You must configure another end condition to indicate the actual end of a message.  ① Transmitted characters ② Received characters ③ First character must be successfully received by this time.

Parameter	Definition
Recognize message end by inter-character gap	The message end occurs when the maximum configured timeout between any two consecutive characters of a message has expired. The default value for the inter-character gap is 12 bit times and the maximum number is 65535 bit times, up to a maximum of eight seconds.  ① Received characters ② Restarts the intercharacter timer ③ The intercharacter timer expires and terminates the message.
Recognize message end by receiving a fixed number of characters	The message end occurs when the specified number of characters has been received. The valid range for the fixed length is 1 to 4096. Note that for the S7-1200, this end condition is only valid for V4.0 CPUs or higher.
Recognize message end by max length	The message end occurs when the configured maximum number of characters has been received. The valid range for maximum length is 1 to 1024. This condition can be used to prevent a message buffer overrun error. When this end condition is combined with timeout end conditions and the timeout condition occurs, any valid received characters are provided even if the maximum length is not reached. This allows support for varying length protocols when only the maximum length is known.
Read message length from message	The message itself specifies the length of the message. The message end occurs when a message of the specified length has been received. The method for specifying and interpreting the message length is described below.
Recognize message end with a character	The message end occurs when a specified character is received.
Recognize message end with a character sequence	The message end occurs when a specified character sequence is received. You can specify a sequence of up to five characters. For each character position, you specify either a specific hex character, or that the character is ignored in sequence matching. Leading characters that are ignored characters are not part of the end condition. Trailing characters that are ignored characters are part of the end condition.

Example configuration: End message with a character sequence

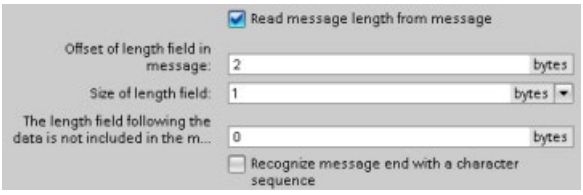
Consider the following end message condition configuration:

In this case, the end condition is satisfied when two consecutive 0x6A characters are received, followed by any two characters. The character preceding the 0x6A 0x6A pattern is not part of the end character sequence. Two characters following the 0x6A 0x6A pattern are required to terminate the end character sequence. The values received at character positions 4 and 5 are irrelevant, but they must be received to satisfy the end condition.

Note

If you want your character sequence to indicate the end of the message, put the sequence in the last character positions. In the example above, if you wanted 0x6A 0x6A to end the message with no trailing characters, you would configure 0x6A in character positions 4 and 5.

Specification of message length within the message



When you select the special condition where the message length is included in the message, you must provide three parameters that define information about the message length.

The actual message structure varies according to the protocol in use. The three parameters are as follows:

- n: the character position (1-based) within the message that starts the length specifier
- Length size: The number of bytes (one, two, or four) of the length specifier
- Length m: the number of characters following the length specifier that are not included in the length count

The ending characters do not need to be contiguous. The "Length m" value can be used to specify the length of a checksum field whose size is not included in the length field.

These fields appear in the Receive message configuration of the device properties:

Example 1: Consider a message structured according to the following protocol:

STX	Len (n)	Characters 3 to 14 counted by the length												
		ADR	PKE		INDEX		PWD		STW		HSW		BCC
1	2	3	4	5	6	7	8	9	10	11	12	13	14
STX	0x0C	xx	xxxx		xxxx		xxxx		xxxx		xxxx		xx

Configure the receive message length parameters for this message as follows:

- n = 2 (The message length starts with byte 2.)
- Length size = 1 (The message length is defined in one byte.)
- Length m = 0 (There are no additional characters following the length specifier that are not counted in the length count. Twelve characters follow the length specifier.)

In this example, the characters from 3 to 14 inclusive are the characters counted by Len (n).

Example 2: Consider another message structured according to the following protocol:

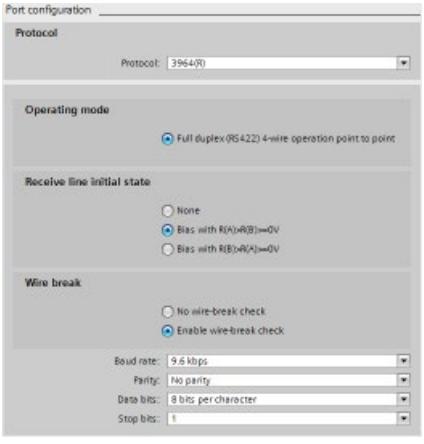
SD1	Len (n)	Len (n)	SD2	Characters 5 to 10 counted by length						FCS	ED
				DA	SA	FA	Data unit=3 bytes				
1	2	3	4	5	6	7	8	9	10	11	12
xx	0x06	0x06	xx	xx	xx	xx	xx	xx	xx	xx	xx

Configure the receive message length parameters for this message as follows:

- n = 3 (The message length starts at byte 3.)
- Length size = 1 (The message length is defined in one byte.)
- Length m = 3 (There are three characters following the length specifier that are not counted in the length. In the protocol of this example, the characters SD2, FCS, and ED are not counted in the length count. The other six characters are counted in the length count; therefore the total number of characters following the length specifier is nine.)

In this example, the characters from 5 to 10 inclusive are the characters counted by Len (n).

13.3.4 Configuring 3964(R) communication



13.3.4.1 Configuring the 3964(R) communication ports

You can use either of the following methods to configure the communication interfaces for 3964(R) communication:

- Use the device configuration in STEP 7 to configure the port parameters. The CPU stores the device configuration settings and applies the settings after a power cycle.
- Use the Port_Config (Page 1090) instruction to set the port parameters. The port settings set by the instructions are valid while the CPU is in RUN mode. The port settings revert to the device configuration settings after a power cycle.

After adding the communication interfaces to the device configuration (Page 154), you configure parameters for the communication interfaces by selecting one of the CMs in your rack.

The "Properties" tab of the inspector window displays the parameters of the selected CM. Select "Port configuration" to edit the following parameters:

- Protocol: 3964(R)
- Operating mode
  (CM 1241 (RS422/485) module only)
- Receive line initial state
  (CM 1241 (RS422/485) module only)
- Wire break
  (CM 1241 (RS422/485) module only)
- Baud rate
- Parity
- Data bits
- Stop bits

Parameter	Definition
Protocol	3964R or Freeport. Select 3964R to configure port for 3964(R) communication
Operating mode*	Full duplex (RS422) four-wire operation point-to-point. (Enabled)
Receive line initial state*	Enable one of the following choices: • None • Bias with R(A)>R(B)>=0V • Bias with R(B)>R(A)>=0V
Wire break*	Enable one of the following choices: • No wire-break check • Enable wire-break check
Baud rate	The default value for the baud rate is 9.6 Kbits per second. Valid choices are: 300 baud, 600 baud, 1.2 Kbits, 2.4 Kbits, 4.8 Kbits, 9.6 Kbits, 19.2 Kbits, 38.4 Kbits, 57.6 Kbits, 76.8 Kbits, and 115.2 Kbits.
Parity	The default value for parity is no parity. Valid choices are: No parity, even, odd, mark (parity bit always set to 1), space (parity bit always set to 0), and any parity (set parity bit to 0 for transmission; ignore parity error when receiving).
Data bits per character	The number of data bits in a character. Valid choices are 7 or 8.
Number of stop bits	The number of stop bits can be either one or two. The default is one.

* CM 1241 (RS422/485) module only

13.3.4.2 Configuring the 3964(R) priority and protocol parameters

You can use either of the following methods to configure the communication interfaces for 3964(R) communication:

- In the device configuration of the communication interface, click "3964(R) configuration" to set the priority and configure the protocol parameters. The CPU stores the device configuration settings and applies the settings after a power cycle.
- Use the P3964_Config (Page 1101) instruction to set the priority and protocol configuration parameters. The values set by the instructions are valid while the CPU is in RUN mode. The values revert to the device configuration settings after a power cycle.

The "Properties" tab of the inspector window displays the parameters of the selected CM. Select "3964(R) configuration" to edit the following parameters:

- Priority (high or low)
- Protocol parameters
  - With block check (3964R)
  - Use default values

    Connection attempts

    Transmission attempts

    Character delay time

    Acknowledgement delay

Parameter	Definition
Priority	High or low: The CM will be either high or low and the communication partner must be the opposite.
With block check (3964)	If selected, 3964(R) communication employs transmission security by including a block check character (BCC). If not selected transmission security does not include a block check character.
Use default values	If selected, 3964(R) uses default values for the following protocol parameters: • Connection attempts • Transmission attempts • Character delay time • Acknowledgement delay If not selected, you can configure values for each of these parameters.
Connection attempts	Number of connection attempts (default value: 6 connection attempts) 1 to 255
Transmission attempts	Number of transmission attempts (default value: 6 connection attempts) 1 to 255
Character delay time	Character delay time setting (depending on the set data transmission rate) (default value: 220 ms) 1 ms to 65535 ms
Acknowledgement delay	Acknowledgment delay time setting (depending on the set data transmission rate) (default value: 2000 ms when block check is enabled; 550 ms when block check is not enabled) 1 ms to 65535 ms

Note

With the exception of Priority, the protocol settings must be the same for the CM module and the communication partner.

13.3.5 Point-to-point instructions

13.3.5.1 Common parameters for Point-to-Point instructions

Table 13- 3 Common input parameters for the PTP instructions

Parameter	Description
REQ	Many of the PtP instructions use the REQ input to initiate the operation on a low to high transition. The REQ input must be high (TRUE) for one execution of an instruction, but the REQ input can remain TRUE for as long as desired. The instruction does not initiate another operation until it has been called with the REQ input FALSE so that the instruction can reset the history state of the REQ input. This is required so that the instruction can detect the low to high transition to initiate the next operation. When you place a PtP instruction in your program, STEP 7 prompts you to identify the instance DB. Use a unique DB for each PtP instruction call. This ensures that each instruction properly handles inputs such as REQ.
PORT	A port address is assigned during communication device configuration. After configuration, a default port symbolic name can be selected from the parameter assistant drop-list. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "Constants" tab of the PLC tag table.
Bit time resolution	Several parameters are specified in a number of bit times at the configured baud rate. Specifying the parameter in bit times allows the parameter to be independent of baud rate. All parameters that are in units of bit times can be specified to a maximum number of 65535. However, the maximum amount of time that a CM or CB can measure is eight seconds.

The DONE, NDR, ERROR, and STATUS output parameters of the PtP instructions provide execution completion status for the PtP operations.

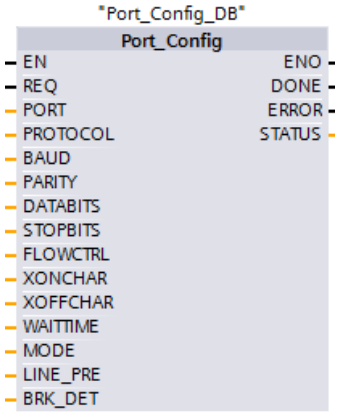
Table 13- 4 DONE, NDR, ERROR, and STATUS output parameters

Parameter	Data type	Default	Description
DONE	Bool	FALSE	Set TRUE for one execution to indicate that the last request completed without errors; otherwise, FALSE.
NDR	Bool	FALSE	Set TRUE for one execution to indicate that the requested action has completed without error and that the new data has been received; otherwise, FALSE.
ERROR	Bool	FALSE	Set TRUE for one execution to indicate that the last request completed with errors, with the applicable error code in STATUS; otherwise, FALSE.
STATUS	Word	0	Result status: • If the DONE or NDR bit is set, then STATUS is set to 0 or to an informational code. • If the ERROR bit is set, then STATUS is set to an error code. • If none of the above bits are set, then the instruction returns status results that describe the current state of the function. STATUS retains its value for the duration of the execution of the function.

Note

The DONE, NDR, and ERROR parameters are set for one execution only. Your program logic must save temporary output state values in data latches, so you can detect state changes in subsequent program scans.

Table 13- 5 Common condition codes



STATUS (W#16#....)	Description
0000	No error
7000	Function is not busy
7001	Function is busy with the first call.
7002	Function is busy with subsequent calls (polls after the first call).
8x3A	Illegal pointer in parameter x
8070	All internal instance memory in use, too many concurrent instructions in progress
8080	Port number is illegal.
8081	Timeout, module error, or other internal error
8082	Parameterization failed because parameterization is in progress in background.
8083	Buffer overflow: The CM or CB returned a received message with a length greater than the length parameter allowed.
8090	Internal error: Wrong message length, wrong sub-module, or illegal message Contact customer support.
8091	Internal error: Wrong version in parameterization message Contact customer support.
8092	Internal error: Wrong record length in parameterization message Contact customer support.

Table 13- 6 Common error classes

Class description	Error classes	Description
Port configuration	16#81Ax	Used to define common port configuration errors
Transmit configuration	16#81Bx	Used to define common transmit configuration errors
Receive configuration	16#81Cx 16#82Cx	Used to define common receive configuration errors
Transmission runtime	16#81Dx	Used to define common transmission runtime errors
Reception runtime	16#81Ex	Used to define common reception runtime errors
Signal handling	16#81Fx	Used to define common errors associated with all signal handling
Pointer errors	16#8p01 to 16#8p51	Used for ANY pointer errors where "p" is the parameter number of the instruction
Embedded protocol errors	16#848x 16#858x	Used for embedded protocol errors

13.3.5.2 Port_Config (Configure communication parameters dynamically)

Table 13- 7 Port_Config (Port Configuration) instruction

LAD / FBD	SCL	Description
	"Port_Config_DB"(REQ:=_bool_in_, PORT:=_word_in_, PROTOCOL:=_uint_in_, BAUD:=_uint_in_, PARITY:=_uint_in_, DATABITS:=_uint_in_, STOPBITS:=_uint_in_, FLOWCTRL:=_uint_in_, XONCHAR:=_char_in_, XOFFCHAR:=_char_in_, WAITTIME:=_uint_in_, MODE:=_uint_in_, LINE_PRE:=_uint_in_, BRK_DET:=_uint_in_, DONE=>_bool_out_, ERROR=>_bool_out_, STATUS=>_word_out_);	Port_Config allows you to change port parameters such as baud rate from your program. You can set up the initial static configuration of the port in the device configuration properties, or just use the default values. You can execute the Port_Config instruction in your program to change the configuration.

[1] STEP 7 automatically creates the DB when you insert the instruction.

The CPU does not permanently store the values you set with the Port_Config instruction. The CPU restores the parameters configured in the device configuration when the CPU transitions from RUN to STOP mode and after a power cycle. See Configuring the communication ports (Page 1073) and Managing flow control (Page 1075) for more information.

Table 13- 8 Data types for the parameters

Parameter and type		Data type	Description
REQ	IN	Bool	Activate the configuration change on rising edge of this input. (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
PROTOCOL	IN	UInt	0 - Freeport protocol (Default value) 1. 3964(R) protocol
BAUD	IN	UInt	Port baud rate (Default value: 6): 1 = 300 baud, 2 = 600 baud, 3 = 1200 baud, 4 = 2400 baud, 5 = 4800 baud, 6 = 9600 baud, 7 = 19200 baud, 8 = 38400 baud, 9 = 57600 baud, 10 = 76800 baud, 11 = 115200 baud
PARITY	IN	UInt	Port parity (Default value: 1): 1 = No parity, 2 = Even parity, 3 = Odd parity, 4 = Mark parity, 5 = Space parity
DATABITS	IN	UInt	Bits per character (Default value: 1): 1 = 8 data bits, 2 = 7 data bits
STOPBITS	IN	UInt	Stop bits (Default value: 1): 1 = 1 stop bit, 2 = 2 stop bits
FLOWCTRL*	IN	UInt	Flow control (Default value: 1): 1 = No flow control, 2 = XON/XOFF, 3 = Hardware RTS always ON, 4 = Hardware RTS switched
XONCHAR[1]	IN	Char	Specifies the character that is used as the XON character. This is typically a DC1 character (16#11). This parameter is only evaluated if flow control is enabled. (Default value: 16#11)
XOFFCHAR[1]	IN	Char	Specifies the character that is used as the XOFF character. This is typically a DC3 character (16#13). This parameter is only evaluated if flow control is enabled. (Default value: 16#13)
WAITTIME[1]	IN	UInt	Specifies how long to wait for a XON character after receiving a XOFF character, or how long to wait for the CTS signal after enabling RTS (0 to 65535 ms). This parameter is only evaluated if flow control is enabled. (Default value: 2000)
MODE[2]	IN	UInt	Specifies the selection of the module's operating mode. • 0 = Full duplex (RS232) • 1 = Full duplex (RS422) four-wire mode (point-to-point), transmitter always enabled • 2 = Full duplex (RS422) four-wire mode (multipoint master), transmitter always enabled • 3 = Full duplex (RS422) four-wire modemultipoint slave, transmitter enabled while sending • 4 = Half dubplex (RS485) two-wire mode

Parameter and type		Data type	Description
LINE_PRE	IN	UInt	Specifies the inactive (idle) line condition. For RS422 and RS485 modules the idle line condition is established by applying a bias voltage to the R(A) and R(B) signals. The following selections are possible: • 0 = Not biased (No Presetting) (default) • 1 = Biased with R(A) > R(B) ≥ 0V; RS422 only • 2 = Biased with R(B) > R(A) ≥ 0V; RS422 and RS485
BRK_DET	IN	UInt	Enables/disables communications cable break detection. Enabling cable break detection causes the module to indicate a fault when the communications cable is not connected to the module. In RS422 Point-to-Point mode cable break detection is only possible when Receive Line Presetting is used with bias applied so that R(A) > R(B) ≥ 0V. • 0 -= No Cable Break Detection (default) • 1 = Cable Break Detection enabled
DONE	OUT	Bool	TRUE for one execution after the last request was completed with no error
ERROR	OUT	Bool	TRUE for one execution after the last request was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)

[1] Not applicable when Protocol=1 (3964(R) protocol)

[2] Only modes 0 and 1 are valid when Protocol=1 (3964(R) protocol) depending on whether your CM module is an RS232 module or RS422 module.

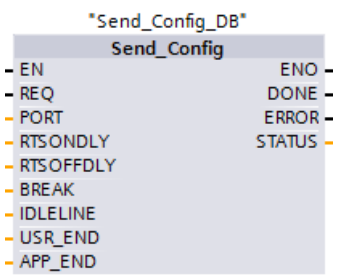


Table 13- 9 Condition codes

STATUS (W#16#....)	Description
81A0	Specific protocol does not exist.
81A1	Specific baud rate does not exist.
81A2	Specific parity option does not exist.
81A3	Specific number of data bits does not exist.
81A4	Specific number of stop bits does not exist.
80A5	Specific type of flow control does not exist.
81A6	Wait time is 0 and flow control enabled
81A7	XON and XOFF are illegal values (for example, the same value)
81A8	Error in the block header (for example, wrong block type or wrong block length)
81A9	Reconfiguration rejected because a configuration is in progress
81AA	Invalid RS422/RS485 mode of operation
81AB	Invalid presetting of the receive line for break detection
81AC	Invalid RS232 break handling
8280	Negative acknowledgement while reading the module
8281	Negative acknowledgement while writing the module
8282	DP slave or module not available

13.3.5.3 Send_Config (Configure serial transmission parameters dynamically)

Table 13- 10 Send_Config (Send Configuration) instruction

LAD / FBD	SCL	Description

	`"Send_Config_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_word_in_,`
	`RTSONDLY:=_uint_in_,`
	`RTSOFFDLY:=_uint_in_,`
	`BREAK:=_uint_in_,`
	`IDLELINE:=_uint_in_,`
	`USR_END:=_string_in_,`
	`APP_END:=_string_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_);`
		Send_Config allows the dynamic configuration of serial transmission parameters for a PtP communication port. Any queued messages within a CM or CB are discarded when Send_Config is executed.

[1] STEP 7 automatically creates the DB when you insert the instruction.

You can set up the initial static configuration of the port in the device configuration properties, or just use the default values. You can execute the Send_Config instruction in your program to change the configuration.

The CPU does not permanently store the values you set with the Send_Config instruction. The CPU restores the parameters configured in the device configuration when the CPU transitions from RUN to STOP mode and after a power cycle. See Configuring transmit (send) parameters (Page 1076).

Table 13- 11 Data types for the parameters

Parameter and type		Data type	Description
REQ	IN	Bool	Activate the configuration change on the rising edge of this input. (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
RTSONDLY	IN	UInt	Number of milliseconds to wait after enabling RTS before any Tx data transmission occurs. This parameter is only valid when hardware flow control is enabled. The valid range is 0 - 65535 ms. A value of 0 disables the feature. (Default value: 0)
RTSOFFDLY	IN	UInt	Number of milliseconds to wait after the Tx data transmission occurs before RTS is disabled: This parameter is only valid when hardware flow control is enabled. The valid range is 0 - 65535 ms. A value of 0 disables the feature. (Default value: 0)
BREAK	IN	UInt	This parameter specifies that a break will be sent upon the start of each message for the specified number of bit times. The maximum is 65535 bit times up to an eight second maximum. A value of 0 disables the feature. (Default value: 12)
IDLELINE	IN	UInt	This parameter specifies that the line will remain idle for the specified number of bit times before the start of each message. The maximum is 65535 bit times up to an eight second maximum. A value of 0 disables the feature. (Default value: 0)
USR_END*	IN	STRING[2]	Specifies the number and the characters in the end delimiter. The end delimiter is embedded in the transmit buffer (characters only) and marks the end of the transmitted message (characters are transmitted until the end delimiter is encountered). The end delimiter is appended to the end of the message. • STRING[2,0,xx,yy] – End delimiter is not used (default) • STRING[2,1,xx,yy] – End delimiter is a single character • STRING[2,2,xx,yy] – End delimiter is two characters Either USR_END or APP_END must have a length of zero.
APP_END*	IN	STRING[5]	Specifies the number and the characters to be appended to the transmitted message (only the characters are appended). STRING[5,0,aa,bb,cc,dd,ee] – End char is not used (default) • STRING[5,1,aa,bb,cc,dd,ee] – Transmit one end character • STRING[5,2,aa,bb,cc,dd,ee] – Transmit two end characters • STRING[5,3,aa,bb,cc,dd,ee]– Transmit three end characters • STRING[5,4,aa,bb,cc,dd,ee] – Transmit four end characters • STRING[5,5,aa,bb,cc,dd,ee] – Transmit five end characters
DONE	OUT	Bool	TRUE for one execution after the last request was completed with no error
ERROR	OUT	Bool	TRUE for one execution after the last request was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)

* Not supported for the CM and CB 1241s; you must use an empty string ("") for the parameter.

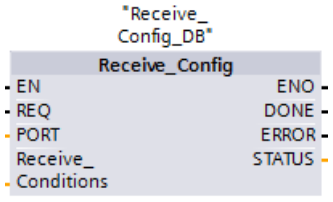

Table 13- 12 Condition codes

STATUS (W#16#....)	Description
81B0	Transmit interrupt configuration is not allowed. Contact customer suport.
81B1	Break time is greater than the maximum allowed value.
81B2	Idle time is greater than the maximum allowed value.
81B3	Error in the block header, for example, wrong block type or wrong block length
81B4	Reconfiguration rejected because a configuration is in progress
81B5	The number of end delimiters specified is greater than two or the number of end characters is greater than five
81B6	Send configuration rejected when configured for firmware embedded protocols
8280	Negative acknowledgement while reading the module
8281	Negative acknowledgement while writing the module
8282	DP slave or module not available

13.3.5.4 Receive_Config (Configure serial receive parameters dynamically)

Table 13- 13 Receive_Config (Receive Configuration) instruction

LAD / FBD	SCL	Description

	`"Receive_Config_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_uint_in_,`
	`Re-`
	`ceive_Conditions:=_struct_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_);`
		Receive_Config performs dynamic configuration of serial receiver parameters for a PtP communication port. This instruction configures the conditions that signal the start and end of a received message. Any queued messages within a CM or CB are discarded when Receive_Config is executed.

1 STEP 7 automatically creates the DB when you insert the instruction.

You can set up the initial static configuration of the communication port in the device configuration properties, or just use the default values. You can execute the Receive_Config instruction in your program to change the configuration.

The CPU does not permanently store the values you set with the Receive_Config instruction. The CPU restores the parameters configured in the device configuration when the CPU transitions from RUN to STOP mode and after a power cycle. See the topic "Configuring receive parameters (Page 1077)" for more information.

Table 13- 14 Data types for the parameters

Parameter and type		Data type	Description
REQ	IN	Bool	Activate the configuration change on the rising edge of this input. (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
CONDITIONS	IN	CONDITIONS	The Conditions data structure specifies the starting and ending message conditions as described below.
DONE	OUT	Bool	TRUE for one scan, after the last request was completed with no error
ERROR	OUT	Bool	TRUE for one scan, after the last request was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)

Start conditions for the Receive_P2P instruction

The Receive_P2P instruction uses the configuration specified by the Receive_Config instruction to determine the beginning and ending of point-to-point communication messages. The start of a message is determined by the start conditions. The start of a message can be determined by one or a combination of start conditions. If more than one start condition is specified, all the conditions must be satisfied before the message is started.

See the topic "Configuring receive parameters (Page 1077)" for a description of the message start conditions.

Parameter CONDITIONS data type structure part 1 (start conditions)

Table 13- 15 CONDITIONS structure for start conditions

Parameter and type		Data type	Description
STARTCOND	IN	UInt	Specifies the start condition (Default value: 1) • 01H - Start Char • 02H - Any Char • 04H - Line Break • 08H - Idle Line • 10H - Sequence 1 • 20H - Sequence 2 • 40H - Sequence 3 • 80H - Sequence 4
IDLETIME	IN	UInt	The number of bit times required for idle line timeout. (Default value: 40). Only used with an idle line condition. 0 to 65535
STARTCHAR	IN	Byte	The start character used with the start character condition. (Default value: B#16#2)
STRSEQ1CTL	IN	Byte	Sequence 1 ignore/compare control for each character: (Default value: B#16#0) These are the enabling bits for each character in start sequence • 01H - Character 1 • 02H - Character 2 • 04H - Character 3 • 08H - Character 4 • 10H - Character 5 Disabling the bit associated with a character means any character will match, in this sequence position.
STRSEQ1	IN	Char[5]	Sequence 1 start characters (5 characters). Default value: 0
STRSEQ2CTL	IN	Byte	Sequence 2 ignore/compare control for each character. Default value: B#16#0)
STRSEQ2	IN	Char[5]	Sequence 2 start characters (5 characters). Default value: 0
STRSEQ3CTL	IN	Byte	Sequence 3 ignore/compare control for each character. Default value: B#16#0
STRSEQ3	IN	Char[5]	Sequence 3 start characters (5 characters). Default value: 0
STRSEQ4CTL	IN	Byte	Sequence 4 ignore/compare control for each character. Default value: B#16#0
STRSEQ4	IN	Char[5]	Sequence 4 start characters (5 characters), Default value: 0

Example

Consider the following received hexadecimal coded message: "**68** 10 aa **68** bb 10 aa 16" and the configured start sequences shown in the table below. Start sequences begin to be evaluated when the first 68H character is successfully received. Upon successfully receiving the fourth character (the second 68H), then start condition 1 is satisfied. Once the start conditions are satisfied, the evaluation of the end conditions begins.

The start sequence processing can be terminated due to various parity, framing, or inter-character timing errors. These errors result in no received message, because the start condition was not satisfied.

Table 13- 16 Start conditions

Start condition	First Character	First Character +1	First Character +2	First Character +3	First Character +4
1	**68**H	xx	xx	**68**H	xx
2	10H	aaH	xx	xx	xx
3	dcH	aaH	xx	xx	xx
4	e5H	xx	xx	xx	xx

End conditions for the Receive_P2P instruction

The end of a message is determined by the specification of end conditions. The end of a message is determined by the first occurrence of one or more configured end conditions. The section "Message end conditions" in the topic "Configuring receive parameters (Page 1077)" describes the end conditions that you can configure in the Receive_Config instruction.

You can configure the end conditions in either the properties of the communication interface in the device configuration, or from the Receive_Config instruction. Whenever the CPU transitions from STOP to RUN, the receive parameters (both start and end conditions) return to the device configuration settings. If the STEP 7 user program executes Receive_Config, then the settings are changed to the Receive_Config conditions.

Parameter CONDITIONS data type structure part 2 (end conditions)

Table 13- 17 CONDITIONS structure for end conditions

Parameter	Parameter type	Data type	Description
ENDCOND	IN	UInt 0	This parameter specifies message end condition: • 01H - Response time • 02H - Message time • 04H - Inter-character gap • 08H - Maximum length • 10H - N + LEN + M • 20H - Sequence
MAXLEN	IN	UInt 1	Maximum message length: Only used when the maximum length end condition is selected. 1 to 1024 bytes
N	IN	UInt 0	Byte position within the message of the length field. Only used with the N + LEN + M end condition. 1 to 1022 bytes
LENGTHSIZE	IN	UInt 0	Size of the byte field (1, 2, or 4 bytes). Only used with the N + LEN + M end condition.
LENGTHM	IN	UInt 0	Specify the number of characters following the length field that are not included in the value of the length field. This is only used with the N + LEN + M end condition. 0 to 255 bytes
RCVTIME	IN	UInt 200	Specify how long to wait for the first character to be received. The receive operation will be terminated with an error if a character is not successfully received within the specified time. This is only used with the response time condition. (0 to 65535 bit times with an 8 second maximum) This parameter is not a message end condition since evaluation terminates when the first character of a response is received. It is an end condition only in the sense that it terminates a receiver operation because no response is received when a response is expected. You must select a separate end condition.
MSGTIME	IN	UInt 200	Specify how long to wait for the entire message to be completely received once the first character has been received. This parameter is only used when the message timeout condition is selected. (0 to 65535 milliseconds)
CHARGAP	IN	UInt 12	Specify the number of bit times between characters. If the number of bit times between characters exceeds the specified value, then the end condition will be satisfied. This is only used with the inter-character gap condition. (0 to 65535 bit times up to 8 second maximum)

Parameter	Parameter type	Data type	Description
ENDSEQ1CTL	IN	Byte B#16#0	Sequence 1 ignore/compare control for each character: These are the enabling bits for each character for the end sequence. Character 1 is bit 0, character 2 is bit 1, …, character 5 is bit 4. Disabling the bit associated with a character means any character will match, in this sequence position.
ENDSEQ1	IN	Char[5] 0	Sequence 1 start characters (5 characters)

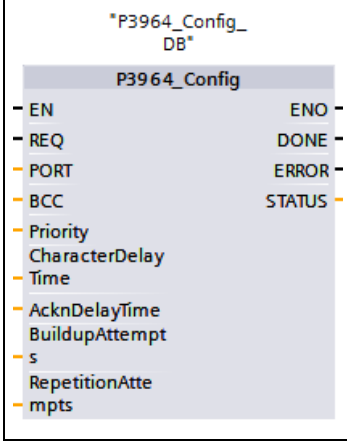

Table 13- 18 Condition codes

STATUS (W#16#....)	Description
81C0	Illegal start condition selected
81C1	Illegal end condition selected, no end condition selected
81C2	Receive interrupt enabled and this is not possible.
81C3	Maximum length end condition is enabled and max length is 0 or > 1024.
81C4	Calculated length is enabled and N is >= 1023.
81C5	Calculated length is enabled and length is not 1, 2 or 4.
81C6	Calculated length is enabled and M value is > 255.
81C7	Calculated length is enabled and calculated length is > 1024.
81C8	Response timeout is enabled and response timeout is zero.
81C9	Inter-character gap timeout is enabled and it is zero.
81CA	Idle line timeout is enabled and it is zero.
81CB	End sequence is enabled but all chars are "don't care".
81CC	Start sequence (any one of 4) is enabled but all characters are "don't care".
81CD	Invalid receive message overwrite protection selection error
81CE	Invalid receive message buffer handling on STOP to RUN transition selection error
81CF	Error in the block header, for example, wrong block type or wrong block length
8281	Negative acknowledgement while writing the module
8282	DP slave or module not available
82C0	Reconfiguration rejected because a configuration is in progress
82C1	The specified value for the number of messages that the module can buffer is greater than the maximum permitted value.
82C2	Receive configuration rejected when configured for firmware embedded protocols
8351	Data type not allowed at this Variant pointer

13.3.5.5 P3964_Config (Configuring the 3964(R) protocol)

Table 13- 19 P3964_Config (Configuring the 3964(R) protocol) instruction

LAD / FBD	SCL	Description

	`"P3964_Config_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_uint_in_,`
	`BCC:=_usint_in,`
	`Priority:= _usint_in,`
	`CharacterDelayTime:=_uint_in,`
	`AcknDelayTime:= _uint_in,`
	`BuildupAttempts:=_usint_in_,`
	`RepetitionAttempts:=_usint_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_);`
		P3964_Config allows you to change priority and protocol parameters during runtime.
		You can set up the initial static configuration of the port in the device configuration properties, or just use the default values. You can execute the P3964_Config instruction in your program to change the configuration.

[1] STEP 7 automatically creates the DB when you insert the instruction.

The CPU does not permanently store the values you set with the P3964_Config instruction. The CPU restores the parameters configured in the device configuration after a power cycle of the CPU. See Configuring the 3964(R) communication priority and protocol parameters (Page 1086) for more information.

Table 13- 20 Data types for the parameters

Parameter and type		Data type	Description
REQ	IN	Bool	Activate the configuration change on rising edge of this input. (Default value: False)
PORT	IN	UInt	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
BCC	IN	USInt	Activates/deactivates the use of the block check • 0 = without block check • 1 = with block check
Priority	IN	UInt	Selection of the priority • 0 = low priority • 1 = high priority The priority of the CM must be the opposite of the priority of the communication partner.
CharacterDelayTime	IN	UInt	Character delay time setting (depending on the set data transmission rate) (default value: 220 ms) 1 ms to 65535 ms
AcknDelayTime	IN	UInt	Acknowledgment delay time setting (depending on the set data transmission rate) (default value: 2000 ms) 1 ms to 65535 ms
BuildupAttempts	IN	UInt	Number of connection attempts (default value: 6 connection attempts) 1 to 255
RepetitionAttempts	IN	UInt	Number of transmission attempts (default value: 6 connection attempts) 1 to 255
DONE	OUT	Bool	TRUE for one execution after the last request was completed with no error
ERROR	OUT	Bool	TRUE for one execution after the last request was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)

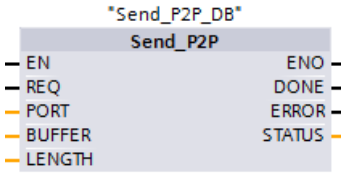

Table 13- 21 Condition codes

STATUS (W#16#....)	Description
16#8380	Parameter assignment error: Invalid value for "Character delay time".
16#8381	Parameter assignment error: Invalid value for "Response timeout".
16#8382	Parameter assignment error: Invalid value for "Priority".
16#8383	Parameter assignment error: Invalid value for "Block check"
16#8384	Parameter assignment error: Invalid value for "Connection attempts".
16#8385	Parameter assignment error: Invalid value for "Transmission attempts".
16#8386	Runtime error: Number of connection attempts exceeded
16#8387	Runtime error: Number of transmission attempts exceeded
16#8388	Runtime error: Error at the "Block check character" The internally calculated value of the block check character does not correspond to the block check character received by the partner at the connection end.
16#8389	Runtime error: Invalid character received while waiting for free receive buffer
16#838A	Runtime error: Logical error during receiving. After DLE was received, a further random character (other than DLE or ETX) was received.
16#838B	Runtime error: Character delay time exceeded
16#838C	Runtime error: Wait time for free receive buffer has started
16#838D	Runtime error: frame repetition does not start within 4 s after NAK
16#838E	Runtime error: In idle mode, one or several characters (other than NAK or STX) were received.
16#838F	Runtime error: Initialization conflict - Both partners have set high priority
16#8391	Parameter assignment error: 3964 configuration data rejected because Freeport is set

13.3.5.6 Send_P2P (Transmit send buffer data)

Table 13- 22 Send_P2P (Send Point-to-Point data) instruction

LAD / FBD	SCL	Description

	`"Send_P2P_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_word_in_,`
	`BUFFER:=_variant_in_,`
	`LENGTH:=_uint_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_);`
		Send_P2P initiates the transmission of the data and transfers the assigned buffer to the communication interface. The CPU program continues while the CM or CB sends the data at the assigned baud rate. Only one send operation can be pending at a given time. The CM or CB returns an error if a second Send_P2P is executed while the CM or CB is already transmitting a message.

[1] STEP 7 automatically creates the DB when you insert the instruction.

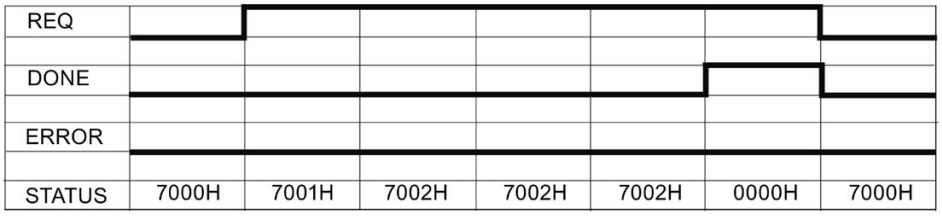

Table 13- 23 Data types for the parameters

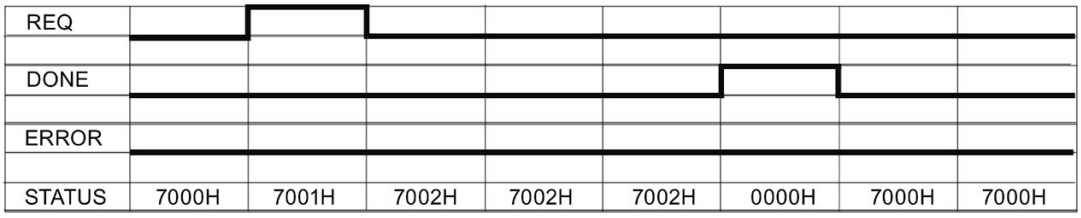
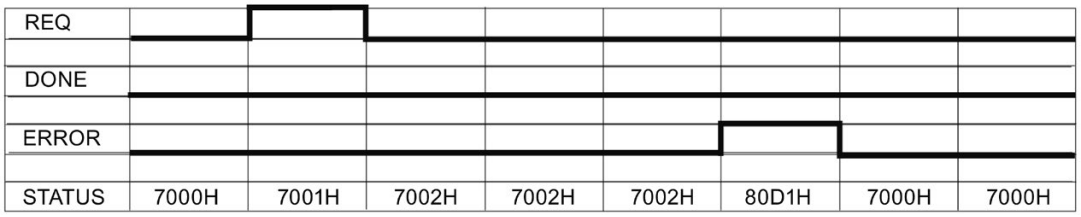
Parameter and type		Data type	Description
REQ	IN	Bool	Activates the requested transmission on the rising edge of this transmission enable input. This initiates transfer of the contents of the buffer to the Point-to-Point communication interface. (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
BUFFER	IN	Variant	This parameter points to the starting location of the transmit buffer. (Default value: 0) **Note:** Boolean data or Boolean arrays are not supported.
LENGTH	IN	UInt	Transmitted frame length in bytes (Default value: 0) When transmitting a complex structure, always use a length of 0. When the length is 0, the instruction transmits the entire frame.
DONE	OUT	Bool	TRUE for one scan, after the last request was completed with no error
ERROR	OUT	Bool	TRUE for one scan, after the last request was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)



While a transmit operation is in progress, the DONE and ERROR outputs are FALSE. When a transmit operation is complete, either the DONE or the ERROR output will be set TRUE to show the status of the transmit operation. While DONE or ERROR is TRUE, the STATUS output is valid.

The instruction returns a status of 16#7001 if the communication interface accepts the transmit data. Subsequent Send_P2P executions return 16#7002, if the CM or CB is still busy transmitting. When the transmit operation is complete, the CM or CB returns the status of the transmit operation as 16#0000 (if no errors occurred). Subsequent executions of Send_P2P with REQ low return a status of 16#7000 (not busy).



The following diagrams show the relationship of the output values to REQ. This assumes that the instruction is called periodically to check for the status of the transmission process. In the diagram below, it is assumed that the instruction is called every scan (represented by the STATUS values).

The following diagram shows how the DONE and STATUS parameters are valid for only one scan if the REQ line is pulsed (for one scan) to initiate the transmit operation.

The following diagram shows the relationship of DONE, ERROR and STATUS parameters when there is an error.

The DONE, ERROR and STATUS values are only valid until Send_P2P executes again with the same instance DB.

Table 13- 24 Condition codes

STATUS (W#16#....)	Description
81D0	New request while transmitter active
81D1	Transmit aborted because of no CTS within wait time
81D2	Transmit aborted because of no DSR from the DCE device
81D3	Transmit aborted because of queue overflow (transmit more than 1024 bytes)
81D5	Reverse bias signal (wire break condition)
81D6	Transmission request rejected because end delimiter was not found in the transmit buffer
81D7	Internal error / error in synchronization between FB and CM
81D8	Transmission attempt rejected because the port has not been configured
81DF	CM has reset the interface to the FB due to one of the following reasons • The module has restarted (Power cycle) • The CPU has reached a breakpoint • The module has been reparameterized In each case the module indicates this code in the Status parameter. The module resets Status and Error to zero after the first received record for SEND_P2P.
8281	Negative acknowledgement while writing the module
8282	DP slave or module not available
8301	Illegal syntax ID at an ANY pointer
8322	Range length error when reading a parameter
8324	Range error when reading a parameter
8328	Alignment error when reading a parameter
8332	The parameter contains a DB number that is higher than the highest permitted number (DB number error).
833A	The DB for the BUFFER parameter does not exist.

Note

Setting the maximum record length for Profibus communication

When using a CM1243-5 Profibus Master module to control an ET 200SP or ET 200MP Profibus device that uses an RS232, RS422, or RS485 point-to-point module, you need to explicitly set the "max_record_len" data block tag to 240 as defined below:

Set "max_record_len" in the instance DB (for example, "Send_P2P_DB".max_record_len) to 240 after running any configuration instruction such as Port_Config, Send_Config, or Receive_Config.

Explicitly assigning max_record_len is only necessary with Profibus communication; Profinet communication already uses a valid max_record_len value.

Interaction of the LENGTH and BUFFER parameters

The minimum size of data that can be transmitted by the SEND_P2P instruction is one byte. The BUFFER parameter determines the size of the data to be transmitted. You cannot use the data type Bool or arrays of Bool for the BUFFER parameter.

You can always set the LENGTH parameter to 0 and ensure that SEND_P2P sends the entire data structure represented by the BUFFER parameter. If you only want to send part of a data structure in the BUFFER parameter, you can set LENGTH as follows:

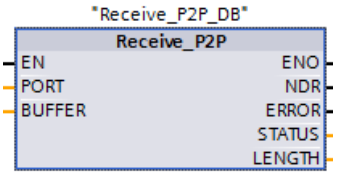


Table 13- 25 LENGTH and BUFFER parameters

LENGTH	BUFFER	Description
= 0	Not used	The complete data is sent as defined at the BUFFER parameter. You do not need to specify the number of transmitted bytes when LENGTH = 0.
> 0	Elementary data type	The LENGTH value must contain the byte count of this data type. For example, for a Word value, the LENGTH must be two. For a Dword or Real, the LENGTH must be four. Otherwise, nothing is transferred and the error 8088H is returned.
	Structure	The LENGTH value can contain a byte count less than the complete byte length of the structure, in which case the instruction sends only the first n bytes of the structure from the BUFFER, where n = LENGTH. Since the internal byte organization of a structure cannot always be determined, you might get unexpected results. In this case, use a LENGTH of 0 to send the complete structure.
	Array	The LENGTH value must contain a byte count that is less than or equal to the complete byte length of the array and which must be a multiple of the data element byte count. For example, the LENGTH parameter for an array of Words must be a multiple of two and for an array of Reals, a multiple of four. When LENGTH is specified, the instruction transfers the number of array elements that correspond to the LENGTH value in bytes. If your BUFFER, for example, contains an array of 15 Dwords (60 total bytes), and you specify a LENGTH of 20, then the first five Dwords in the array are transferred. The LENGTH value must be a multiple of the data element byte count. Otherwise, STATUS = 8088H, ERROR = 1, and no transmission occurs.
	String	The LENGTH parameter contains the number of characters to be transmitted. Only the characters of the String are transmitted. The maximum and actual length bytes of the String are not transmitted.

13.3.5.7 Receive_P2P (Enable receive messages)

Table 13- 26 Receive_P2P (Receive Point-to-Point) instruction

LAD / FBD	SCL	Description

	`"Receive_P2P_DB"(`
	`PORT:=_word_in_,`
	`BUFFER:=_variant_in_,`
	`NDR=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`LENGTH=>_uint_out_);`
		Receive_P2P checks for messages that have been received in the CM or CB. If a message is available, it will be transferred from the CM or CB to the CPU. An error returns the appropriate STATUS value.

[1] STEP 7 automatically creates the DB when you insert the instruction.

Table 13- 27 Data types for the parameters

Parameter and type		Data type	Description
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
BUFFER	IN	Variant	This parameter points to the starting location of the receive buffer. This buffer should be large enough to receive the maximum length message. Boolean data or Boolean arrays are not supported. (Default value: 0)
NDR	OUT	Bool	TRUE for one execution when new data is ready and operation is complete with no errors.
ERROR	OUT	Bool	TRUE for one execution after the operation was completed with an error.
STATUS	OUT	Word	Execution condition code (Default value: 0)
LENGTH	OUT	UInt	Length of the returned message in bytes (Default value: 0)

The STATUS value is valid when either NDR or ERROR is TRUE. The STATUS value provides the reason for termination of the receive operation in the CM or CB. This is typically a positive value, indicating that the receive operation was successful and that the receive process terminated normally. If the STATUS value is negative (the Most Significant Bit of the hexadecimal value is set), the receive operation was terminated for an error condition such as parity, framing, or overrun errors.

Each PtP communication interface can buffer up to a maximum of 1024 bytes. This could be one large message or several smaller messages. If more than one message is available in the CM or CB, the Receive_P2P instruction returns the oldest message available. A subsequent Receive_P2P instruction execution returns the next oldest message available.

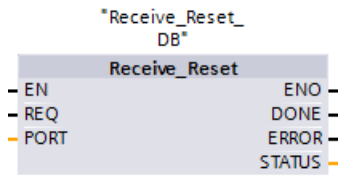

Table 13- 28 Condition codes

STATUS (W#16#...)	Description
0000	No buffer present
0094	Message terminated due to received maximum character length
0095	Message terminated because of message timeout
0096	Message terminated because of inter-character timeout
0097	Message terminated because of response timeout
0098	Message terminated because the "N+LEN+M" length condition was satisfied
0099	Message terminated because of end sequence was satisfied
8085	LENGTH parameter has a value of 0 or is greater than 1KB.
8088	The LENGTH parameter or the received length is longer than the area specified in BUFFER or the received length is longer than the area specified in BUFFER.
8090	Incorrect configuration message, wrong message length, wrong submodule, illegal message
81E0	Message terminated because the receive buffer is full
81E1	Message terminated due to parity error
81E2	Message terminated due to framing error
81E3	Message terminated due to overrun error
81E4	Message terminated because calculated length exceeds buffer size
81E5	Reverse bias signal (wire break condition)
81E6	The message queue is full. This error is reported without data. If it occurs, the module toggles between an error free data transfer and this error.
81E7	Internal error, error in synchronization between instruction and CM: set wehn a sequence error is detected
81E8	Message terminated, inter-character timeout expired before the end of message criteria was satisfied
81E9	Modbus CRC error detected (Only used by modules that support CRC generation/checking for the Modbus protocol)
81EA	Modbus telegram is too short (Only used by modules that support CRC generation/checking for the Modbus protocol)
81EB	Message terminated, because maximum message size exceeded
8201	Illegal syntax ID at an ANY pointer
8223	Range length error when writing a parameter. The parameter is located either entirely or partly outside the range of an address or that the length of a bit range is not a multiple of 8 with an ANY pointer.
8225	Range error when writing a parameter. The parameter is located in a range that is illegal for the system function.
8229	Alignment error when writing a parameter. The referenced parameter is located at bit address that is not equal to 0.
8230	Parameter is located in a read-only global DB
8231	Parameter is located in a read-only instance DB.
8232	Parameter contains a DB number that is higher than the highest block number allowed (DB number error).
823A	The DB for the BUFFER parameter does not exist.
8280	Negative acknowledgement while reading the module
8282	DP slave or module not available

13.3.5.8 Receive_Reset (Delete receive buffer)

Table 13- 29 Receive_Reset (Receiver Reset) instruction

LAD / FBD	SCL	Description

	`"Receive_Reset_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_word_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_);`
		Receive_Reset clears the receive buffers in the CM or CB.

[1] STEP 7 automatically creates the DB when you insert the instruction.

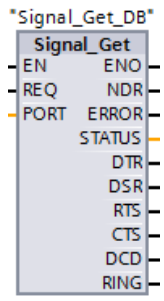

Table 13- 30 Data types for parameters

Parameter and type		Data type	Description
REQ	IN	Bool	Activates the receiver reset on the rising edge of this enable input (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
DONE	OUT	Bool	When TRUE for one scan, indicates that the last request was completed without errors.
ERROR	OUT	Bool	When TRUE, shows that the last request was completed with errors. Also, when this output is TRUE, the STATUS output will contain related error codes.
STATUS	OUT	Word	Error code (Default value: 0)

13.3.5.9 Signal_Get (Query RS-232 signals)

Table 13- 31 Signal_Get (Get RS232 signals) instruction

LAD / FBD	SCL	Description

	`"Signal_Get_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_uint_in_,`
	`NDR=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`DTR=>_bool_out_,`
	`DSR=>_bool_out_,`
	`RTS=>_bool_out_,`
	`CTS=>_bool_out_,`
	`DCD=>_bool_out_,`
	`RING=>_bool_out_);`
		Signal_Get reads the current states of RS232 communication signals.
		This function is valid only for the RS232 CM.

[1] STEP 7 automatically creates the DB when you insert the instruction.

Table 13- 32 Data types for the parameters

Parameter and type		Data type	Description
REQ	IN	Bool	Get RS232 signal state values on the rising edge of this input (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table.
NDR	OUT	Bool	TRUE for one scan, when new data is ready and the operation is complete with no errors
ERROR	OUT	Bool	TRUE for one scan, after the operation was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)
DTR	OUT	Bool	Data terminal ready, module ready (output). Default value: False
DSR	OUT	Bool	Data set ready, communication partner ready (input). Default value: False
RTS	OUT	Bool	Request to send, module ready to send (output). Default value: False
CTS	OUT	Bool	Clear to send, communication partner can receive data (input). Default value: False
DCD	OUT	Bool	Data carrier detect, receive signal level (always False, not supported)
RING	OUT	Bool	Ring indicator, indication of incoming call (always False, not supported)

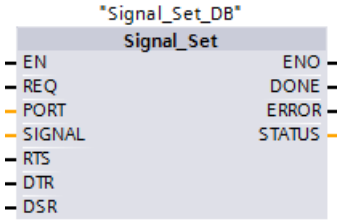

Table 13- 33 Condition codes

STATUS (W#16#....)	Description
81F0	CM or CB is RS485 and no signals are available
81F4	Error in the block header, for example, wrong block type or wrong block length
8280	Negative acknowledgement while reading the module
8282	DP slave or module not available

13.3.5.10 Signal_Set (Set RS-232 signals)

Table 13- 34 Signal_Set (Set RS232 signals) instruction

LAD / FBD	SCL	Description

	`"Signal_Set_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_word_in_,`
	`SIGNAL:=_byte_in_,`
	`RTS:=_bool_in_,`
	`DTR:=_bool_in_,`
	`DSR:=_bool_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_);`
		Signal_Set sets the states of RS232 communication signals.
		This function is valid only for the RS232 CM.

[1] STEP 7 automatically creates the DB when you insert the instruction.

Table 13- 35 Data types for parameters

Parameter and type		Data type	Description
REQ	IN	Bool	Start the set RS232 signals operation, on the rising edge of this input (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
SIGNAL	IN	Byte	Selects which signal to set: (multiple allowed). Default value: 0 • 01H = Set RTS • 02H = Set DTR • 04H = Set DSR
RTS	IN	Bool	Request to send, module ready to send value to set (true or false), Default value: False
DTR	IN	Bool	Data terminal ready, module ready to send value to set (true or false). Default value: False
DSR	IN	Bool	Data set ready (only applies to DCE type interfaces), not used.
DONE	OUT	Bool	TRUE for one execution after the last request was completed with no error
ERROR	OUT	Bool	TRUE for one execution after the last request was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)

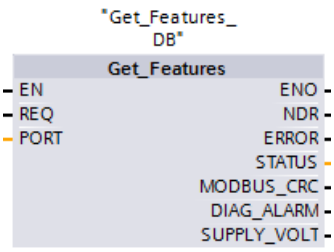

Table 13- 36 Condition codes

STATUS (W#16#....)	Description
81F0	CM or CB is RS485 and no signals can be set
81F1	Signals cannot be set because of Hardware flow control
81F2	Cannot set DSR because module is DTE
81F3	Cannot set DTR because module is DCE
81F4	Error in the block header, for example, wrong block type or wrong block length
8280	Negative acknowledgement while reading the module
8281	Negative acknowledgement while writing the module
8282	DP slave or module not available

13.3.5.11 Get_Features

Table 13- 37 Get_Features (Get advanced features) instruction

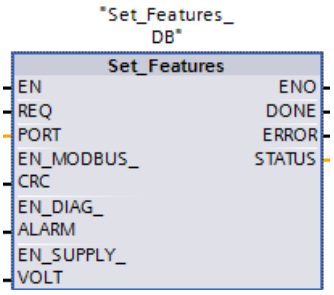
LAD / FBD	SCL	Description

	`"Get_Features_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_word_in_,`
	`NDR:=_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`MODBUS_CRC=>_bool_out_,`
	`DIAG_ALARM=>_bool_out_,`
	`SUPPLY_VOLT=>_bool_out);`
		Get_Features reads the advanced feature capabilities of a module.

[1] STEP 7 automatically creates the DB when you insert the instruction.

Use the Get_Features instruction to read the advanced feature capabilites of a module.

Table 13- 38 Data types for the parameters



Parameter and type		Data type	Description
REQ	IN	Bool	Activate the configuration change on the rising edge of this input. (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
NDR	OUT	Bool	Indicates that new data is ready.
ERROR	OUT	Bool	TRUE for one scan, after the last request was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)
MODBUS_CRC*	OUT	Bool	MODBUS CRC generation and checking
DIAG_ALARM*	OUT	Bool	Diagnostic alarm generation
SUPPLY_VOLT*	OUT	Bool	Diagnostics for missing supply voltage L+ is available

*Get_Features returns TRUE (1) if the feature is available, FALSE (0) if the feature is not available

13.3.5.12 Set_Features

Table 13- 39 Set_Features (Set advanced features) instruction

LAD / FBD	SCL	Description

	`"Set_Features_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_word_in_,`
	`EN_MODBUS_CRC:=_bool_in_,`
	`EN_DIAG_ALARM:=_bool_in_,`
	`EN_SUPPLY_VOLT:=_bool_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_);`
		Set_Features enables the advanced features that a module supports.

[1] STEP 7 automatically creates the DB when you insert the instruction.

Use the Set_Features instruction to read the advanced feature capabilites of a module.

Table 13- 40 Data types for the parameters

Parameter and type		Data type	Description
REQ	IN	Bool	Activate the configuration change on the rising edge of this input. (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
EN_MODBUS_CRC	IN	Bool	Enable MODBUS CRC generation and checking: • 0: CRC calculation tuned OFF (default) • 1: CRC calculation turned ON Note: Only V2.1 CMs, V4.1 CPUs with CBs, and CM PtP modules for distributed I/O support this parameter.
EN_DIAG_ALARM	IN	Bool	Enable diagnostic alarm generation: • 0: Diagnostic alarm turned OFF • 1: Diagnostic alarm turned ON (default)
EN_SUPPLY_VOLT	IN	Bool	Enable diagnostics for missing supply voltage L+: • 0: Supply voltage diagnostic disabled (default) • 1: Supply voltage diagnostic enabled
DONE	OUT	Bool	Indicates that set features is done
ERROR	OUT	Bool	TRUE for one scan, after the last request was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)

13.3.6 Programming the PtP communications

STEP 7 provides extended instructions that enable the user program to perform Point-to-Point communications with a protocol designed and implemented in the user program. These instructions fall into two categories:

- Configuration instructions
- Communication instructions

Configuration instructions

Before your user program can engage in PtP communication, you must configure the communication interface port and the parameters for sending data and receiving data.

You can perform the port configuration and message configuration for each CM or CB through the device configuration or through these instructions in your user program:

- Port_Config (Page 1090)
- Send_Config (Page 1093)
- Receive_Config (Page 1095)

Communication instructions

The PtP communication instructions enable the user program to send messages to and receive messages from the communication interfaces. For information about transferring data with these instructions, see the section on data consistency (Page 192).

All of the PtP functions operate asynchronously. The user program can use a polling architecture to determine the status of transmissions and receptions. Send_P2P and Receive_P2P can execute concurrently. The communication modules and communication board buffer the transmit and receive messages as necessary up to a maximum buffer size of 1024 bytes.

The CMs and CB send messages to and receive messages from the actual point-to-point devices. The message protocol is in a buffer that is either received from or sent to a specific communication port. The buffer and port are parameters of the send and receive instructions:

- Send_P2P (Page 1103)
- Receive_P2P (Page 1108)

Additional instructions provide the capability to reset the receive buffer, and to get and set specific RS232 signals:

- Receive_Reset (Page 1110)
- Signal_Get (Page 1110)
- Signal_Set (Page 1112)

13.3.6.1 Polling architecture

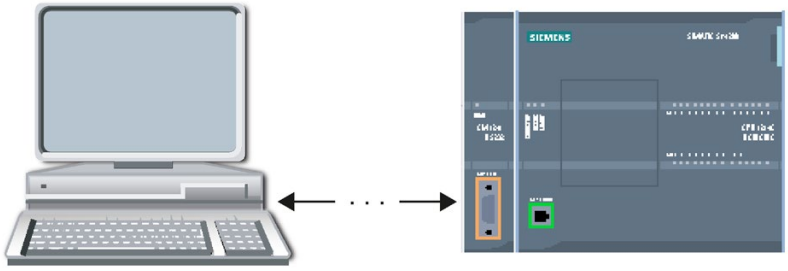
The STEP 7 user program must call the S7-1200 point-to-point instructions cyclically/periodically to check for received messages. Polling the send tells the user program when the transmit has completed.

Polling architecture: master

The typical sequence for a master is as follows:

1. A Send_P2P (Page 1103) instruction initiates a transmission to the CM or CB.
2. The Send_P2P instruction executes on subsequent scans to poll for the transmit complete status.
3. When the Send_P2P instruction indicates that the transmission is complete, the user code can prepare to receive the response.
4. The Receive_P2P (Page 1108) instruction executes repeatedly to check for a response. When the CM or CB has collected a response message, the Receive_P2P instruction copies the response to the CPU and indicates that new data has been received.
5. The user program can process the response.
6. Go to step 1 and repeat the cycle.

Polling architecture: slave



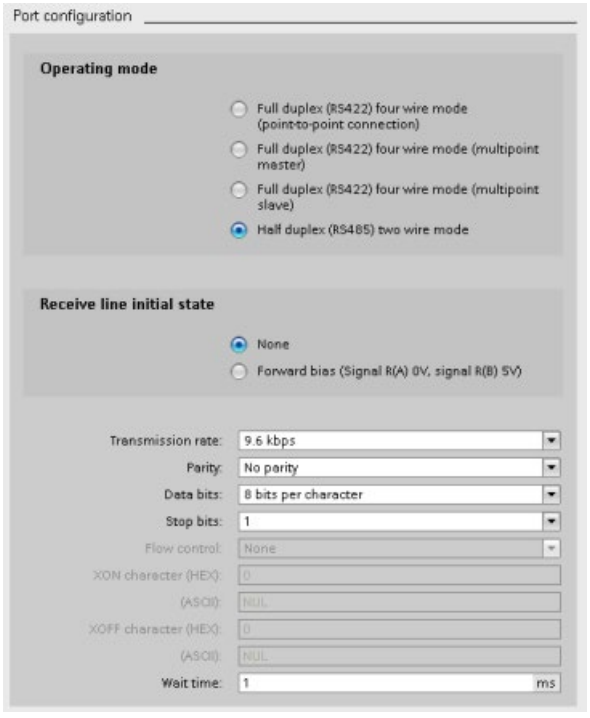
The typical sequence for a slave is as follows:

1. The user program executes the Receive_P2P instruction every scan.
2. When the CM or CB has received a request, the Receive_P2P instruction indicates that new data is ready and the request is copied into the CPU.
3. The user program services the request and generates a response.
4. Use a Send_P2P instruction to send the response back to the master.
5. Repeatedly execute Send_P2P to be sure the transmit occurs.
6. Go to step 1 and repeat the cycle.

The slave must be responsible for calling Receive_P2P frequently enough to receive a transmission from the master before the master times out while waiting for a response. To accomplish this task, the user program can call RCV_PTP from a cyclic OB, where the cycle time is sufficient to receive a transmission from the master before the timeout period expires. If you set the cycle time for the OB to provide for two executions within the timeout period of the master, the user program can receive transmissions without missing any.

13.3.7 Example: Point-to-Point communication

In this example, an S7-1200 CPU communicates to a PC with a terminal emulator through a CM 1241 RS232 module. The point-to-point configuration and STEP 7 program in this example illustrate how the CPU can receive a message from the PC and echo the message back to the PC.

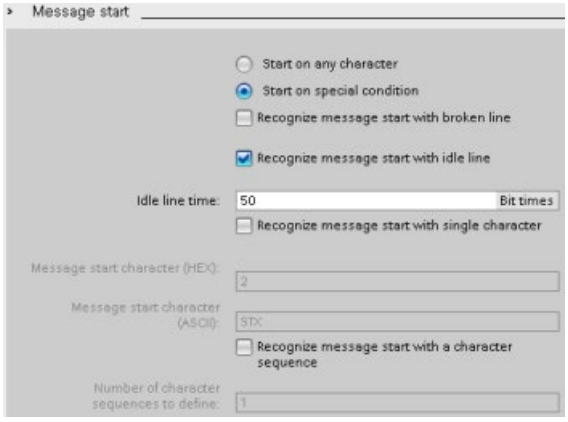


You must connect the communication interface of the CM 1241 RS232 module to the RS232 interface of the PC, which is normally COM1. Because both of these ports are Data Terminal Equipment (DTE), you must switch the receive and transmit pins (2 and 3) when connecting the two ports, which you can accomplish by either of the following methods:

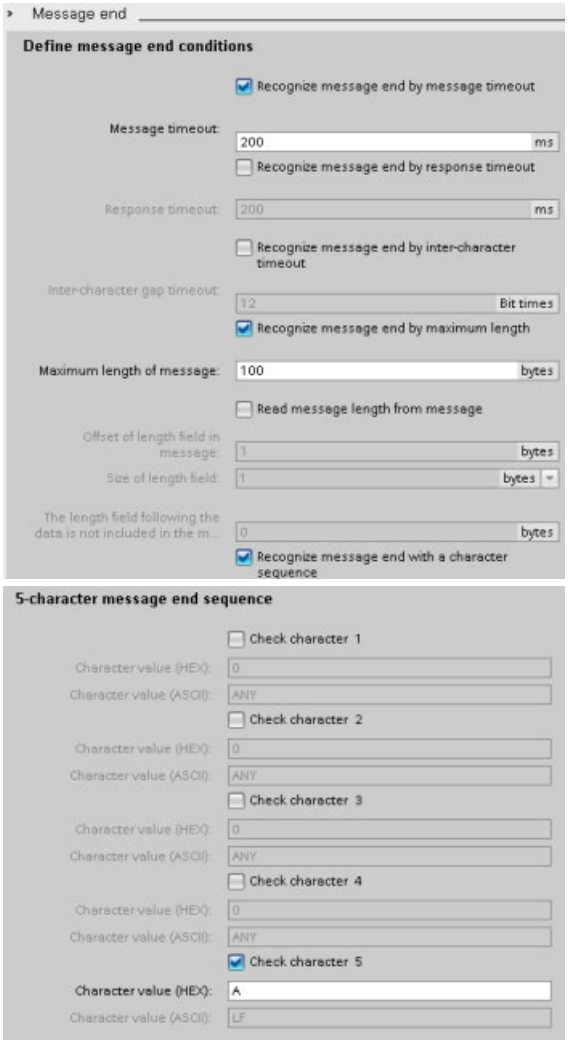
- Use a NULL modem adapter to swap pins 2 and 3 together with a standard RS232 cable.
- Use a NULL modem cable, which already has pins 2 and 3 swapped. You can usually identify a NULL modem cable as one with two female 9-pin D connector ends.

13.3.7.1 Configuring the communication module

You can configure the CM 1241 from the Device configuration in STEP 7 or with user program instructions. This example uses the Device configuration method.



- Port configuration: Click the communication port of the CM module from the Device configuration, and configure the port as shown:



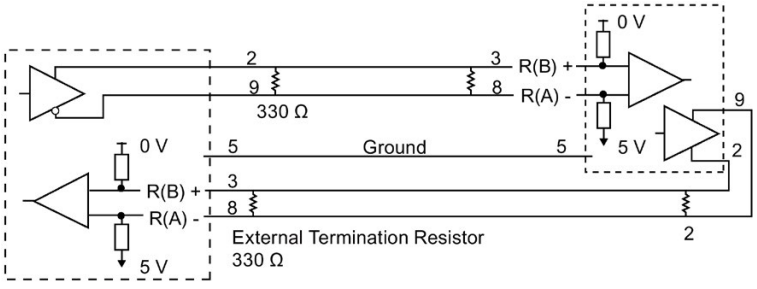
Note

The configuration settings for "Operating mode" and "Receive line initial state" are only applicable for the CM 1241 (RS422/RS485) module. The other CM 1241 modules do not have these port configuration settings. Refer to Configuring the RS422 and RS485 (Page 1122).

- Transmit message configuration: Accept the default for transmit message configuration. No break is to be sent at message start.
- Receive message start configuration: Configure the CM 1241 to start receiving a message when the communication line is inactive for at least 50 bit times (about 5 milliseconds at 9600 baud = 50 * 1/9600):

- Receive message end configuration: Configure the CM 1241 to end a message when it receives a maximum of 100 bytes or a linefeed character (10 decimal or a hexadecimal). The end sequence allows up to five end characters in sequence. The fifth character in the sequence is the linefeed character. The preceding four end sequence characters are "don't care" or unselected characters. The CM 1241 does not evaluate the "don't care" characters but looks for a linefeed character preceded by zero or more "don't care" characters to indicate the message end.

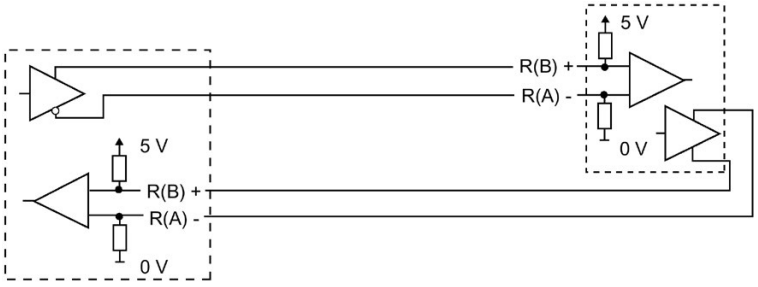
13.3.7.2 RS422 and RS485 operating modes



Configuring the RS422

For RS422 mode, there are three operating modes depending on your network configuration. Select one of these operating modes based on the devices in your network. The different selections for Receive line initial state reference the cases shown below for more details.

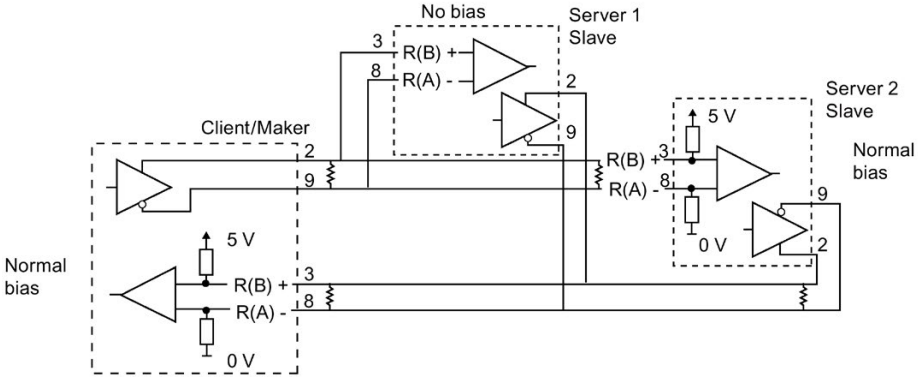
- Full duplex (RS422) four wire mode (point-to-point connection): select this option when there are two devices on your network. In the Receive line initial state:
  - Select none when you supply the bias and termination (Case 3).
  - Select forward bias to use internal bias and termination (Case 2).
  - Select reverse bias to use internal bias and termination, and enable cable break detection for both devices (Case 1).
- Full duplex (RS422) four wire mode (multipoint master): select this option for the master device when you have a network with one master and multiple slaves. In the Receive line initial state:
  - Select none when you supply the bias and termination (Case 3).
  - Select forward bias to use internal bias and termination (Case 2).
  - Cable break detection is not possible in this mode.
- Full duplex (RS422) four wire mode (multipoint slave): Select this option for all the slave devices when you have a network with one master and multiple slaves. In the Receive line initial state:
  - Select none when you supply the bias and termination (Case 3).
  - Select forward bias to use internal bias and termination (Case 2).
  - Select reverse bias to use internal bias and termination, and enable cable break detection for the slaves (Case 1).



Case 1: RS422 with cable break detection

- Mode of operation: RS422
- Receive line initial state: Reverse bias (biased with R(A) > R(B) > 0V)
- Cable break: Cable break detection enabled (transmitter always active)

Case 2: RS422 No cable break detection, forward bias



- Mode of operation: RS422
- Receive line initial state: Forward bias (biased with R(B) > R(A) > 0 V)
- Cable break: No cable break detection (transmitter enabled only while transmitting)

Case 3: RS422: No cable break detection, no bias

- Mode of operation: RS422
- Receive line initial state: no bias
- Cable break: No cable break detection (transmitter enabled only while transmitting)

Bias and termination are added by the user at the end nodes of the network.

Configuring the RS485

For RS485 mode, there is only one operating mode. The different selections for Receive line initial state reference the cases shown below for more details.

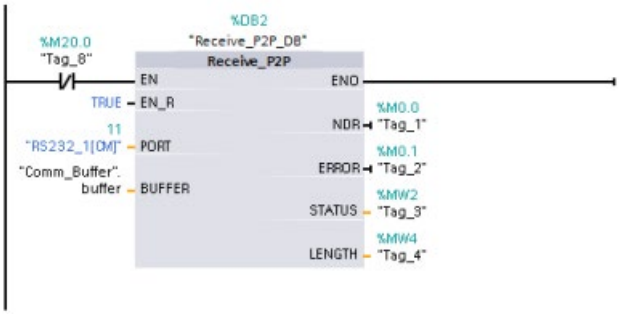
- Half duplex (RS485) two wire mode. In the Receive line initial state:
  - Select none when you supply the bias and termination (Case 5).
  - Select forward bias to use internal bias and termination (Case 4).

Case 4: RS485: Forward bias

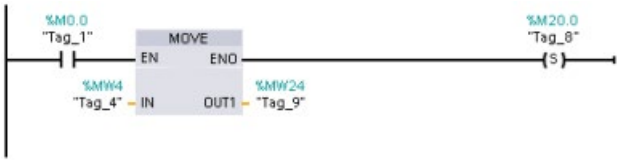
- Mode of operation: RS485
- Receive line initial state: Forward bias (biased with R(B) > R(A) > 0 V)

Case 5: RS485: No bias (external bias)

- Mode of operation: RS485
- Receive line initial state: No bias (external bias required)

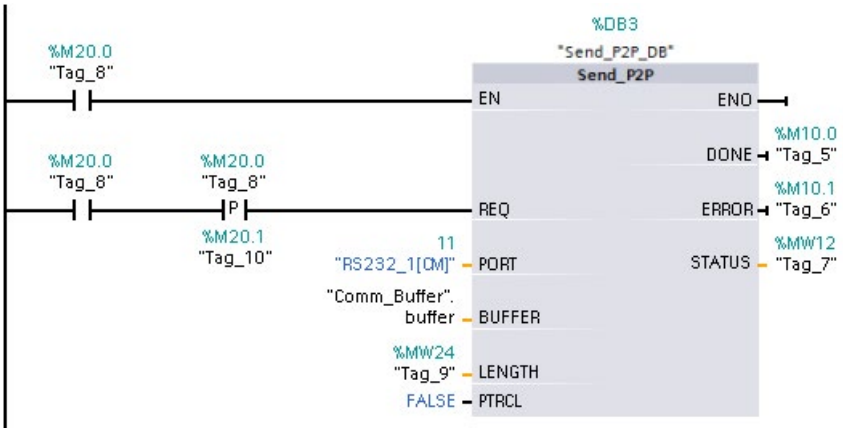


13.3.7.3 Programming the STEP 7 program

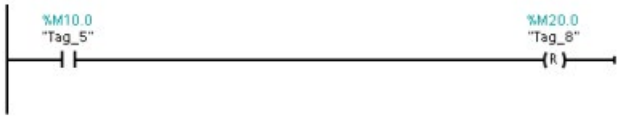


The example program uses a global data block for the communication buffer, a RCV_PTP instruction (Page 1215) to receive data from the terminal emulator, and a SEND_PTP instruction (Page 1212) to echo the buffer back to the terminal emulator. To program the example, add the data block configuration and Main program block OB 1 as described below.

Global data block "Comm_Buffer": Create a global data block (DB) and name it "Comm_Buffer". Create one value in the data block called "buffer" with a data type of "array [0 .. 99] of byte".



Network 1: Enable the RCV_PTP instruction whenever SEND_PTP is not active. Tag_8 at MW20.0 indicates when sending is complete in Network 4, and when the communication module is thus ready to receive a message.



Network 2: Use the NDR value (Tag_1 at M0.0) set by the RCV_PTP instruction to make a copy of the number of bytes received and to set a flag (Tag_8 at M20.0) to trigger the SEND_PTP instruction.

Network 3: Enable the SEND_PTP instruction when the M20.0 flag is set. Also use this flag to set the REQ input to TRUE for one scan. The REQ input tells the SEND_PTP instruction that a new request is to be transmitted. The REQ input must only be set to TRUE for one execution of SEND_PTP. The SEND_PTP instruction is executed every scan until the transmit completes. The transmit is complete when the last byte of the message has been transmitted from the CM 1241. When the transmit is complete, the DONE output (Tag_5 at M10.0) is set TRUE for one execution of SEND_PTP.

Network 4: monitor the DONE output of SEND_PTP and reset the transmit flag (Tag_8 at M20.0) when the transmit operation is complete. When the transmit flag is reset, the RCV_PTP instruction in Network 1 is enabled to receive the next message.

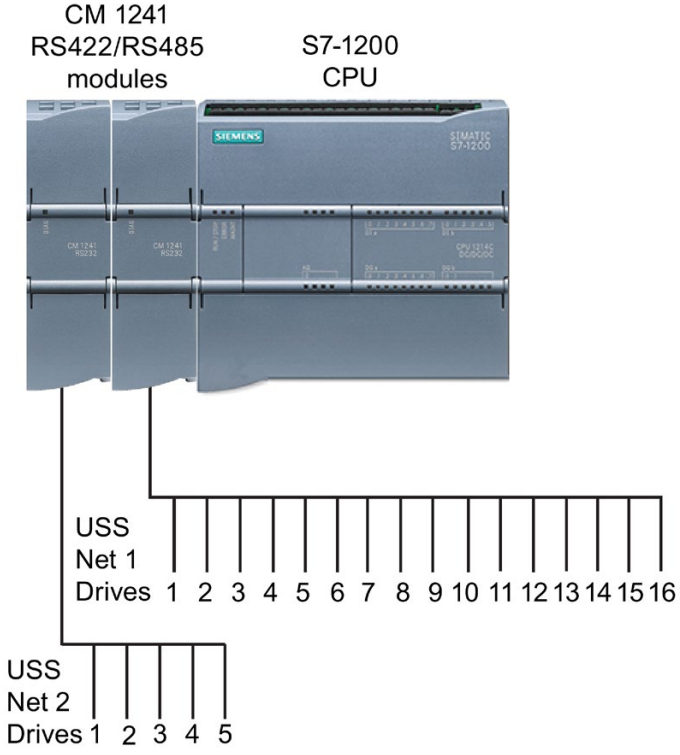
13.3.7.4 Configuring the terminal emulator

You must set up the terminal emulator to support the example program. You can use most any terminal emulator on your PC, such as HyperTerminal. Make sure that the terminal emulator is in the disconnected mode before editing the settings as follows:

1. Set the terminal emulator to use the RS232 port on the PC (normally COM1).
2. Configure the port for 9600 baud, 8 data bits, no parity (none), 1 stop bit and no flow control.
3. Change the settings of the terminal emulator to emulate an ANSI terminal.
4. Configure the terminal emulator ASCII setup to send a line feed after every line (after the user presses the Enter key).
5. Echo the characters locally so that the terminal emulator displays what is typed.

13.3.7.5 Running the example program

To exercise the example program, follow these steps:



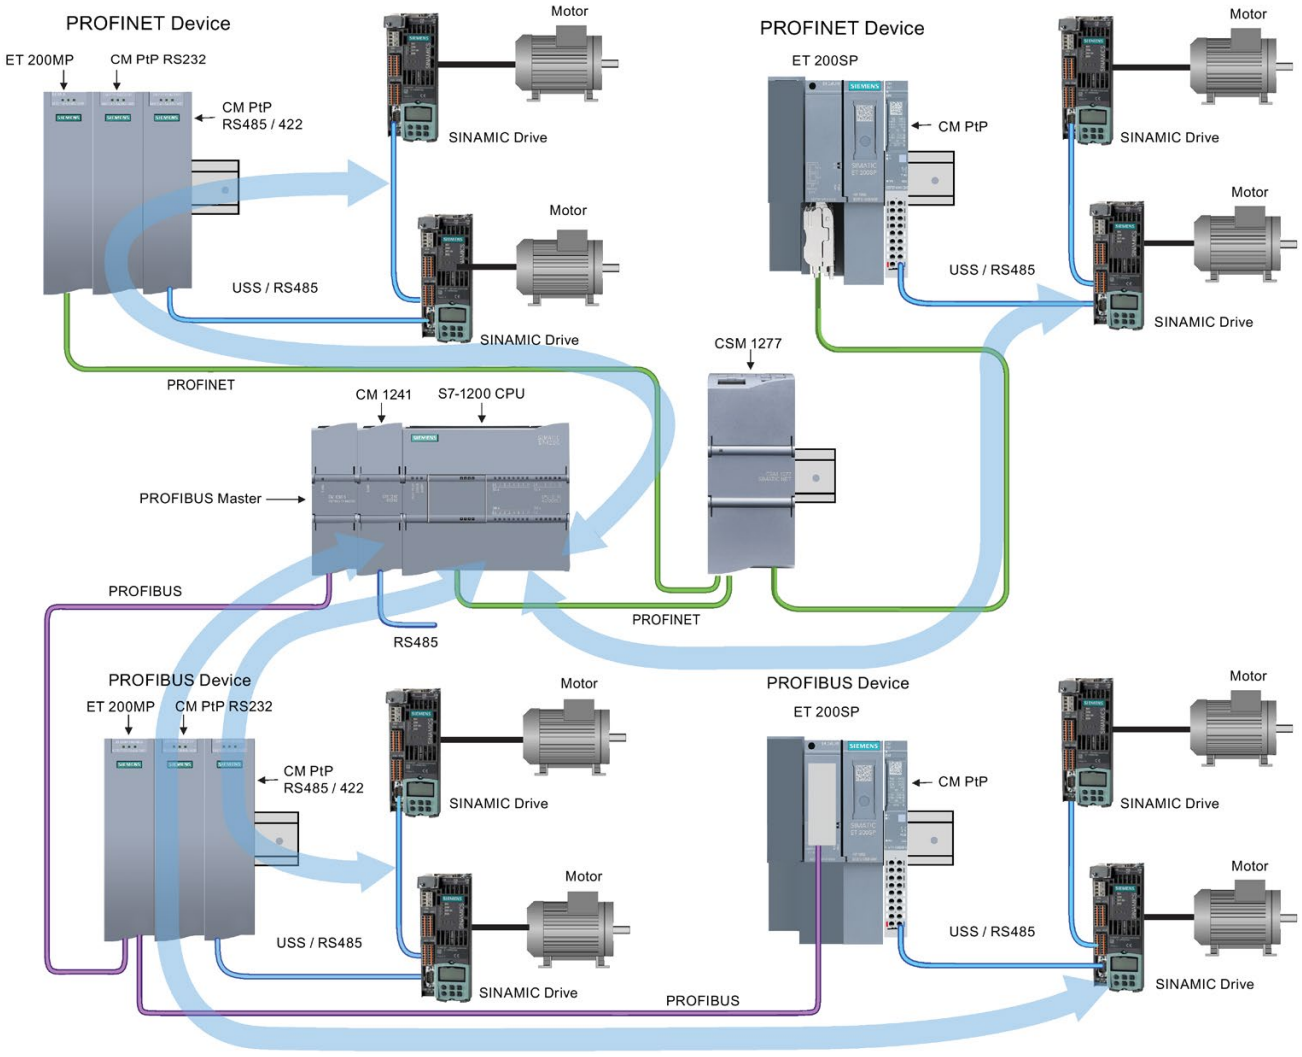
1. Download the STEP 7 program to the CPU and ensure that it is in RUN mode.
2. Click the "connect" button on the terminal emulator to apply the configuration changes and open a terminal session to the CM 1241.
3. Type characters at the PC and press Enter.

The terminal emulator sends the characters to the CM 1241 and to the CPU. The CPU program then echoes the characters back to the terminal emulator.

13.4 Universal serial interface (USS) communication

The USS instructions control the operation of motor drives which support the universal serial interface (USS) protocol. You can use the USS instructions to communicate with multiple drives through RS485 connections to CM 1241 RS485 communication modules or a CB 1241 RS485 communication board. Up to three CM 1241 RS422/RS485 modules and one CB 1241 RS485 board can be installed in a S7-1200 CPU. Each RS485 port can operate up to sixteen drives.

The USS protocol uses a master-slave network for communications over a serial bus. The master uses an address parameter to send a message to a selected slave. A slave itself can never transmit without first receiving a request to do so. Direct message transfer between the individual slaves is not possible. USS communication operates in half-duplex mode. The following USS illustration shows a network diagram for an example drive application.



USS communications through PROFIBUS or PROFINET

As of version V4.1 of the S7-1200 CPU together with STEP 7 V13 SP1, the CPU extends the capability of USS to use a PROFINET or PROFIBUS distributed I/O rack to communicate to various devices (RFID readers, GPS device, and others):

- PROFINET (Page 786): You connect the Ethernet interface of the S7-1200 CPU to a PROFINET interface module. PtP communication modules in the rack with the interface module can then provide serial communications to the PtP devices.
- PROFIBUS (Page 947): You insert a PROFIBUS communication module in the left side of the rack with the S7-1200 CPU. You connect the PROFIBUS communication module to a rack containing a PROFIBUS interface module. PtP communication modules in the rack with the interface module can then provide serial communications to the PtP devices.

For this reason, the S7-1200 supports two sets of PtP instructions:

- Legacy USS instructions (Page 1225): These USS instructions existed prior to version V4.0 of the S7-1200 and only work with serial communications using a CM 1241 communication module or CB 1241 communication board.
- USS instructions (Page 1134): These USS instructions provide all of the functionality of the legacy instructions, plus the ability to connect to PROFINET and PROFIBUS distributed I/O. These USS instructions allow you to configure the communications between the PtP communication modules in the distributed I/O rack and the PtP devices. S7-1200 CM 1241 modules must have a minimum firmware version of V2.1 to use these USS instructions.

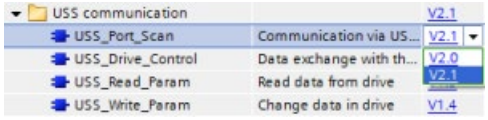
The blue arrows indicate the flow of bidirectional communication between devices.

Note

With version V4.1 of the S7-1200, you can use the point-to-point instructions for all types of point-to-point communication: serial, serial over PROFINET, and serial over PROFIBUS. STEP 7 provides the legacy point-to-point instructions only to support existing programs. The legacy instructions still function with all S7-1200 CPUs. You do not have to convert prior programs from one set of instructions to the other.

13.4.1 Selecting the version of the USS instructions

There are two versions of USS instructions available in STEP 7:

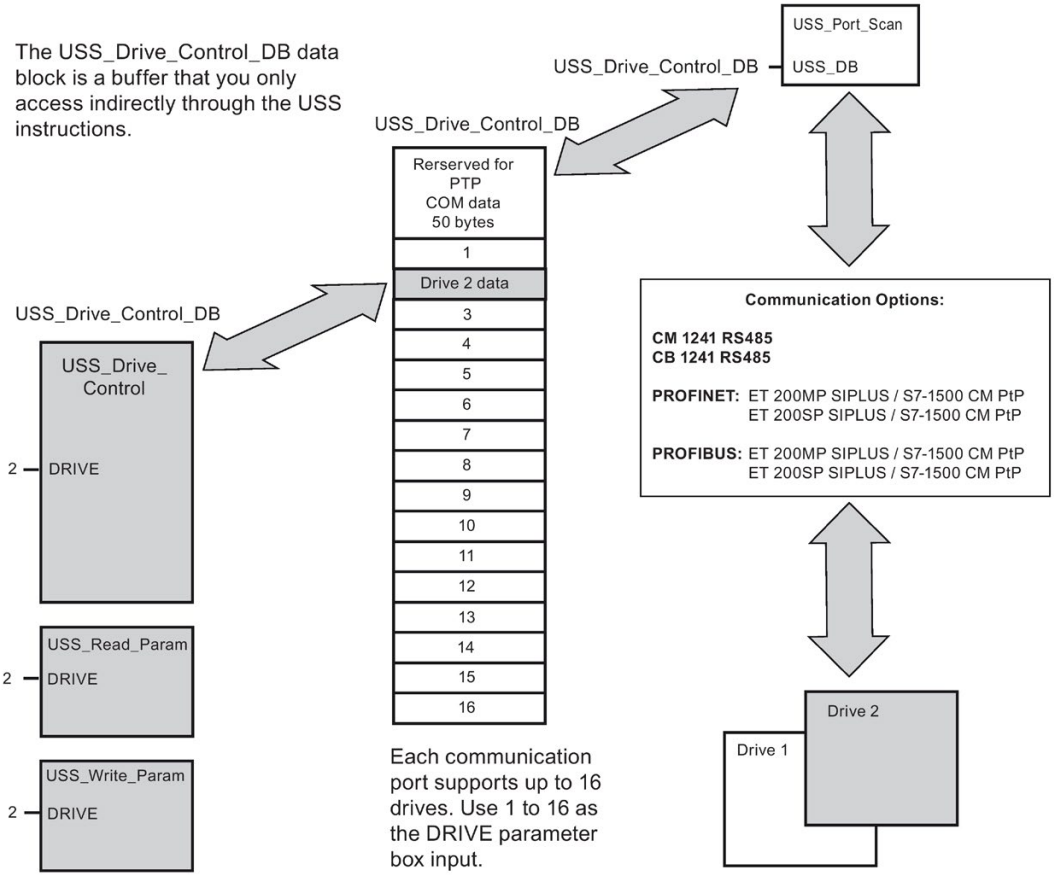


- Version 2.0 (legacy instructions) was initially available in STEP 7 Basic/Professional V13.
- Version 2.1 is available in STEP 7 Basic/Professional V13 SP1 or later.

For compatibility and ease of migration, you can choose which instruction version to insert into your user program.

You cannot use both versions of the instructions with the same module, but two different modules can use different versions of the instructions.

Click the icon on the instruction tree task card to enable the headers and columns of the instruction tree.



To change the version of the USS instructions, select the version from the drop-down list. You can select the group or individual instructions.

When you use the instruction tree to place a USS instruction in your program, a new FB or FC instance, depending on the USS instruction selected, is created in the project tree. You can see new FB or FC instance in the project tree under PLC_x > Program blocks > System blocks > Program resources.

To verify the version of a USS instruction in a program, you must inspect project tree properties and not the properties of a box displayed in the program editor. Select a project tree USS FB or FC instance, right-click, select "Properties", and select the "Information" page to see the USS instruction version number.

13.4.2 Requirements for using the USS protocol

The four USS instructions use two function blocks (FBs) and two functions (FCs) to support the USS protocol. One USS_Port_Scan instance data block (DB) is used for each USS network. The USS_Port_Scan instance data block contains temporary storage and buffers for all drives on that USS network. The USS instructions share the information in this data block.

All drives (up to 16) connected to a single RS485 port are part of the same USS network. All drives connected to a different RS485 port are part of a different USS network. Each USS network is managed using a unique data block. All instructions associated with a single USS network must share this data block. This includes all USS_Drive_Control, USS_Port_Scan, USS_Read_Param, and USS_Write_Param instructions used to control all drives on a single USS network.

The USS_Drive_Control instruction is a Function Block (FB). When you place the USS_Drive_Control instruction into the program editor, you will be prompted by the "Call options" dialog to assign a DB for this FB. If this is the first USS_Drive_Control instruction in this program for this USS network, then you can accept the default DB assignment (or change the name if you wish) and the new DB is created for you. If however this is not the first USS_Drive_Control instruction for this channel, then you must use the drop-down list in the "Call options" dialog to select the DB name that was previously assigned for this USS network.

The USS_Port_Scan instruction is a Function Block (FB) and handles the actual communication between the CPU and the drives through the Point-to-Point (PtP) RS485 communication port. Each call to this FB handles one communication with one drive. Your program must call this FB fast enough to prevent a communication timeout by the drives. You may call this function FB in a main program cycle OB or any interrupt OB.

The USS_Read_Param, and USS_Write_Param instructions are both Functions (FCs). No DB is assigned when you place these FCs in the editor. Instead, you must assign the appropriate DB reference to the "USS_DB" input of these instructions. Double-click on the parameter field and then click on the parameter helper icon to see the available DB names).

Typically, you should call the USS_Port_Scan FB from a cyclic interrupt OB. The cycle time of the cyclic interrupt OB should be set to about half of the minimum call interval (As an example, 1200 baud communication should use a cyclic time of 350 ms or less).

The USS_Drive_Control FB provides your program access to a specified drive on the USS network. Its inputs and outputs are the status and controls for the drive. If there are 16 drives on the network, your program must have at least 16 USS_Drive_Control calls, one for each drive. These blocks should be called at the rate that is required to control the operation of the drive.

You may only call the USS_Drive_Control FB from a main program cycle OB.

CAUTION

Considerations in calling USS instructions from OBs

Only call USS_Drive_Control, USS_Read_Param, and USS_Write_Param from a main program cycle OB. The USS_Port_Scan FB can be called from any OB, usually from a cyclic interrupt OB.

Do not use instructions USS_Drive_Control, USS_Read_Param, and USS_Write_Param in a higher priority OB than the corresponding USS_Port_Scan instruction. For example, do not place the USS_Port_Scan in the main OB and a USS_Read_Param in a cyclic interrupt OB. Failure to prevent interruption of USS_Port_Scan execution can produce unexpected errors, which could result in personal injury.

The USS_Read_Param, and USS_Write_Param FCs read and write the remote drive operating parameters. These parameters control the internal operation of the drive. See the drive manual for the definition of these parameters. Your program can contain as many of these functions as necessary, but only one read or write request can be active per drive, at any given time. You may only call the USS_Read_Param, and USS_Write_Param FCs from a main program cycle OB.

Calculating the time required for communicating with the drive

Communications with the drive are asynchronous to the S7-1200 scan cycle. The S7-1200 typically completes several scans before one drive communications transaction is completed.

The USS_Port_Scan interval is the time required for one drive transaction. The table below shows the minimum USS_Port_Scan interval for each communication baud rate. Calling the USS_Port_Scan FB more frequently than the USS_Port_Scan interval will not increase the number of transactions. The drive timeout interval is the amount of time that might be taken for a transaction, if communications errors caused 3 tries to complete the transaction. By default, the USS protocol library automatically does up to 2 retries on each transaction.

Table 13- 41 Calculating the time requirements

Baud rate	Calculated minimum USS_Port_Scan call Interval (milliseconds)	Drive message interval timeout per drive (milliseconds)
1200	790	2370
2400	405	1215
4800	212.5	638
9600	116.3	349
19200	68.2	205
38400	44.1	133
57600	36.1	109
115200	28.1	85

13.4.3 USS instructions

13.4.3.1 USS_Port_Scan (Edit communication using USS network)

Table 13- 42 USS_Port_Scan instruction

LAD / FBD	SCL	Description

	`USS_Port_Scan(`
	`  PORT:=_uint_in_,`
	`  BAUD:=_dint_in_,`
	`  ERROR=>_bool_out_,`
	`  STATUS=>_word_out_,`
	`  USS_DB:=_fbtref_inout_);`
		The USS_Port_Scan instruction handles communication over a USS network.

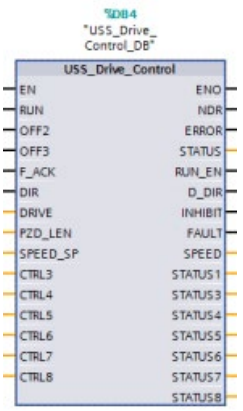
Table 13- 43 Data types for the parameters

Parameter and type		Data type	Description
PORT	IN	Port	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table.
BAUD	IN	DInt	The baud rate used for USS communication.
USS_DB	INOUT	USS_BASE	The name of the instance DB that is created and initialized when a USS_Drive_Control instruction is placed in your program.
ERROR	OUT	Bool	When true, this output indicates that an error has occurred and the STATUS output is valid.
STATUS	OUT	Word	The status value of the request indicates the result of the scan or initialization. Additional information is available in the "USS_Extended_Error" variable for some status codes.

Typically, there is only one USS_Port_Scan instruction per PtP communication port in the program, and each call of this Function Block (FB) handles a transmission to or from a single drive. All USS functions associated with one USS network and PtP communication port must use the same instance DB.

Your program must execute the USS_Port_Scan instruction often enough to prevent drive timeouts. USS_Port_Scan is usually called from a cyclic interrupt OB to prevent drive timeouts and keep the most recent USS data updates available for USS_Drive_Control calls.

Note



When using the USS protocol library and the USS_Port_Scan instruction with a CB 1241, you must set the LINE_PRE data block tag to a value of 0 (No initial state). The default value of 2 for the LINE_PRE data block tag results in an error value of 16#81AB being returned by the USS_Port_Scan instruction. The LINE_PRE data block tag is found in the data block associated with the USS_Port_Scan instruction (usually named USS_Port_Scan_DB).

Ensure the start value of LINE_PRE is changed to a 0 (zero).

13.4.3.2 USS_Drive_Control (Swap data with drive)

Table 13- 44 USS_Drive_Control instruction

LAD / FBD	SCL	Description

	`"USS_Drive_Control_DB"(`
	`RUN:=_bool_in_,`
	`OFF2:=_bool_in_,`
	`OFF3:=_bool_in_,`
	`F_ACK:=_bool_in_,`
	`DIR:=_bool_in_,`
	`DRIVE:=_usint_in_,`
	`PZD_LEN:=_usint_in_,`
	`SPEED_SP:=_real_in_,`
	`CTRL3:=_word_in_,`
	`CTRL4:=_word_in_,`
	`CTRL5:=_word_in_,`
	`CTRL6:=_word_in_,`
	`CTRL7:=_word_in_,`
	`CTRL8:=_word_in_,`
	`NDR=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`RUN_EN=>_bool_out_,`
	`D_DIR=>_bool_out_,`
	`INHIBIT=>_bool_out_,`
	`FAULT=>_bool_out_,`
	`SPEED=>_real_out_,`
	`STATUS1=>_word_out_,`
	`STATUS3=>_word_out_,`
	`STATUS4=>_word_out_,`
	`STATUS5=>_word_out_,`
	`STATUS6=>_word_out_,`
	`STATUS7=>_word_out_,`
	`STATUS8=>_word_out_);`
		The USS_Drive_Control instruction exchanges data with a drive by creating request messages and interpreting the drive response messages. A separate function block should be used for each drive, but all USS functions associated with one USS network and PtP communication port must use the same instance data block. You must create the DB name when you place the first USS_Drive_Control instruction and then reference the DB that was created by the initial instruction usage.
		STEP 7 automatically creates the DB when you insert the instruction.

[1] LAD and FBD: Expand the box to reveal all the parameters by clicking the bottom of the box. The parameter pins that are grayed are optional and parameter assignment is not required.

Table 13- 45 Data types for the parameters

Parameter and type		Data type	Description
RUN	IN	Bool	Drive start bit: When true, this input enables the drive to run at the preset speed. When RUN goes to false while a drive is running, the motor will be ramped down to a stop. This behavior differs from the dropping power (OFF2) or braking the motor (OFF3).
OFF2	IN	Bool	Electrical stop bit: When false, this bit causes the drive to coast to a stop with no braking.
OFF3	IN	Bool	Fast stop bit: When false, this bit causes a fast stop by braking the drive rather than just allowing the drive to coast to a stop.
F_ACK	IN	Bool	Fault acknowledge bit: This bit is set to reset the fault bit on a drive. The bit is set after the fault is cleared to indicate to the drive it no longer needs to indicate the previous fault.
DIR	IN	Bool	Drive direction control: This bit is set to indicate that the direction is forward (for positive SPEED_SP).
DRIVE	IN	USInt	Drive address: This input is the address of the USS drive. The valid range is drive 1 to drive 16.
PZD_LEN	IN	USInt	Word length: This is the number of words of PZD data. The valid values are 2, 4, 6, or 8 words. The default value is 2.
SPEED_SP	IN	Real	Speed set point: This is the speed of the drive as a percentage of configured frequency. A positive value specifies forward direction (when DIR is true). Valid range is 200.00 to -200.00.
CTRL3	IN	Word	Control word 3: A value written to a user-configurable parameter on the drive. You must configure this on the drive. (optional parameter)
CTRL4	IN	Word	Control word 4: A value written to a user-configurable parameter on the drive. You must configure this on the drive. (optional parameter)
CTRL5	IN	Word	Control word 5: A value written to a user-configurable parameter on the drive. You must configure this on the drive. (optional parameter)
CTRL6	IN	Word	Control word 6: A value written to a user-configurable parameter on the drive. You must configure this on the drive. (optional parameter)
CTRL7	IN	Word	Control word 7: A value written to a user-configurable parameter on the drive. You must configure this on the drive. (optional parameter)
CTRL8	IN	Word	Control word 8: A value written to a user-configurable parameter on the drive. You must configure this on the drive. (optional parameter)
NDR	OUT	Bool	New data ready: When true, the bit indicates that the outputs contain data from a new communication request.
ERROR	OUT	Bool	Error occurred: When true, this indicates that an error has occurred and the STATUS output is valid. All other outputs are set to zero on an error. Communication errors are only reported on the USS_Port_Scan instruction ERROR and STATUS outputs.
STATUS	OUT	Word	The status value of the request indicates the result of the scan. This is not a status word returned from the drive.
RUN_EN	OUT	Bool	Run enabled: This bit indicates whether the drive is running.
D_DIR	OUT	Bool	Drive direction: This bit indicates whether the drive is running forward.
INHIBIT	OUT	Bool	Drive inhibited: This bit indicates the state of the inhibit bit on the drive.
FAULT	OUT	Bool	Drive fault: This bit indicates that the drive has registered a fault. You must fix the problem and then set the F_ACK bit to clear this bit when set.

Parameter and type		Data type	Description
SPEED	OUT	Real	Drive Current Speed (scaled value of drive status word 2): The value of the speed of the drive as a percentage of configured speed.
STATUS1	OUT	Word	Drive Status Word 1: This value contains fixed status bits of a drive.
STATUS3	OUT	Word	Drive Status Word 3: This value contains a user-configurable status word on the drive.
STATUS4	OUT	Word	Drive Status Word 4: This value contains a user-configurable status word on the drive.
STATUS5	OUT	Word	Drive Status Word 5: This value contains a user-configurable status word on the drive.
STATUS6	OUT	Word	Drive Status Word 6: This value contains a user-configurable status word on the drive.
STATUS7	OUT	Word	Drive Status Word 7: This value contains a user-configurable status word on the drive.
STATUS8	OUT	Word	Drive Status Word 8: This value contains a user-configurable status word on the drive.

When the initial USS_Drive_Control execution occurs, the drive indicated by the USS address (parameter DRIVE) is initialized in the Instance DB. After this initialization, subsequent executions of USS_Port_Scan can begin communication to the drive at this drive number.

Changing the drive number requires a CPU STOP-to-RUN mode transition that initializes the instance DB. Input parameters are configured into the USS TX message buffer and outputs are read from a "previous" valid response buffer if any exists. There is no data transmission during USS_Drive_Control execution. Drives communicate when USS_Port_Scan is executed. USS_Drive_Control only configures the messages to be sent and interprets data that might have been received from a previous request.

You can control the drive direction of rotation using either the DIR input (Bool) or using the sign (positive or negative) with the SPEED_SP input (Real). The following table indicates how these inputs work together to determine the drive direction, assuming the motor is wired for forward rotation.

Table 13- 46 Interaction of the SPEED_SP and DIR parameters

SPEED_SP	DIR	Drive rotation direction
Value > 0	0	Reverse
Value > 0	1	Forward
Value < 0	0	Forward
Value < 0	1	Reverse

13.4.3.3 USS_Read_Param (Readout parameters from the drive)

Table 13- 47 USS_Read_Param instruction

LAD / FBD	SCL	Description

	`USS_Read_Param(REQ:=_bool_in_,`
	`DRIVE:=_usint_in_,`
	`PARAM:=_uint_in_,`
	`INDEX:=_uint_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`VALUE=>_variant_out_,`
	`USS_DB:=_fbtref_inout_);`
		The USS_Read_Param instruction reads a parameter from a drive. All USS functions associated with one USS network and PtP communication port must use the same data block. USS_Read_Param must be called from a main program cycle OB.

Table 13- 48 Data types for the parameters

Parameter type		Data type	Description
REQ	IN	Bool	Send request: When true, REQ indicates that a new read request is desired. This is ignored if the request for this parameter is already pending.
DRIVE	IN	USInt	Drive address: DRIVE is the address of the USS drive. The valid range is drive 1 to drive 16.
PARAM	IN	UInt	Parameter number: PARAM designates which drive parameter is written. The range of this parameter is 0 to 2047. On some drives, the most significant byte can access PARAM values greater than 2047. See your drive manual for details on how to access an extended range.
INDEX	IN	UInt	Parameter index: INDEX designates which Drive Parameter index is to be written. A 16-bit value where the Least Significant Byte is the actual index value with a range of (0 to 255). The Most Significant Byte may also be used by the drive and is drive-specific. See your drive manual for details.
USS_DB	INOUT	USS_BASE	The name of the instance DB that is created and initialized when a USS_Drive_Control instruction is placed in your program.
VALUE	IN	Word, Int, UInt, DWord, DInt, UDInt, Real	This is the value of the parameter that was read and is valid only when the DONE bit is true.
DONE[1]	OUT	Bool	When true, indicates that the VALUE output holds the previously requested read parameter value. This bit is set when USS_Drive_Control sees the read response data from the drive. This bit is reset when either: you request the response data using another USS_Read_Param poll, or on the second of the next two calls to USS_Drive_Control.

Parameter type		Data type	Description
ERROR	OUT	Bool	Error occurred: When true, ERROR indicates that an error has occurred and the STATUS output is valid. All other outputs are set to zero on an error. Communication errors are only reported on the USS_Port_Scan instruction ERROR and STATUS outputs.
STATUS	OUT	Word	STATUS indicates the result of the read request. Additional information is available in the "USS_Extended_Error" variable for some status codes.

[1] The DONE bit indicates that valid data has been read from the referenced motor drive and delivered to the CPU. It does not indicate that the USS library is capable of immediately reading another parameter. A blank PKW request must be sent to the motor drive and must also be acknowledged by the instruction before the parameter channel for the specific drive becomes available for use. Immediately calling a USS_Read_Param or USS_Write_Param FC for the specified motor drive will result in a "0x818A" error.

13.4.3.4 USS_Write_Param (Change parameters in the drive)

Note

EEPROM write operations (for the EEPROM inside a USS drive)

Do not overuse the EEPROM permanent write operation. Minimize the number of EEPROM write operations to extend the EEPROM life.

Table 13- 49 USS_Write_Param instruction

LAD / FBD	SCL	Description

	`USS_Write_Param(REQ:=_bool_in_,`
	`DRIVE:=_usint_in_,`
	`PARAM:=_uint_in_,`
	`INDEX:=_uint_in_,`
	`EEPROM:=_bool_in_,`
	`VALUE:=_variant_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`USS_DB:=_fbtref_inout_);`
		The USS_Write_Param instruction modifies a parameter in the drive. All USS functions associated with one USS network and PtP communication port must use the same data block.
		USS_Write_Param must be called from a main program cycle OB.

Table 13- 50 Data types for the parameters

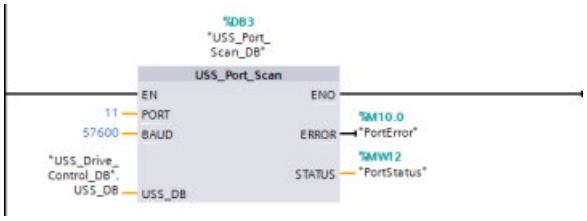
Parameter and type		Data type	Description
REQ	IN	Bool	Send request: When true, REQ indicates that a new write request is desired. This is ignored if the request for this parameter is already pending.
DRIVE	IN	USInt	Drive address: DRIVE is the address of the USS drive. The valid range is drive 1 to drive 16.
PARAM	IN	UInt	Parameter number: PARAM designates which drive parameter is written. The range of this parameter is 0 to 2047. On some drives, the most significant byte can access PARAM values greater than 2047. See your drive manual for details on how to access an extended range.
INDEX	IN	UInt	Parameter index: INDEX designates which Drive Parameter index is to be written. A 16-bit value where the least significant byte is the actual index value with a range of (0 to 255). The most significant byte may also be used by the drive and is drive-specific. See your drive manual for details.
EEPROM	IN	Bool	Store To Drive EEPROM: When true, a write drive parameter transaction will be stored in the drive EEPROM. If false, the write is temporary and will not be retained if the drive is power cycled.
VALUE	IN	Word, Int, UInt, DWord, DInt, UDInt, Real	The value of the parameter that is to be written. It must be valid on the transition of REQ.
USS_DB	INOUT	USS_BASE	The name of the instance DB that is created and initialized when a USS_Drive_Control instruction is placed in your program.
DONE[1]	OUT	Bool	When true, DONE indicates that the input VALUE has been written to the drive. This bit is set when USS_Drive_Control sees the write response data from the drive. This bit is reset when either you request the response data using another USS_Drive_Control poll, or on the second of the next two calls to USS_Drive_Control.
ERROR	OUT	Bool	When true, ERROR indicates that an error has occurred and the STATUS output is valid. All other outputs are set to zero on an error. Communication errors are only reported on the USS_Port_Scan instruction ERROR and STATUS outputs.
STATUS	OUT	Word	STATUS indicates the result of the write request. Additional information is available in the "USS_Extended_Error" variable for some status codes.

[1] The DONE bit indicates that valid data has been read from the referenced motor drive and delivered to the CPU. It does not indicate that the USS library is capable of immediately reading another parameter. A blank PKW request must be sent to the motor drive and must also be acknowledged by the instruction before the parameter channel for the specific drive becomes available for use. Immediately calling a USS_Read_Param or USS_Write_Param FC for the specified motor drive will result in a "0x818A" error.

13.4.4 USS status codes

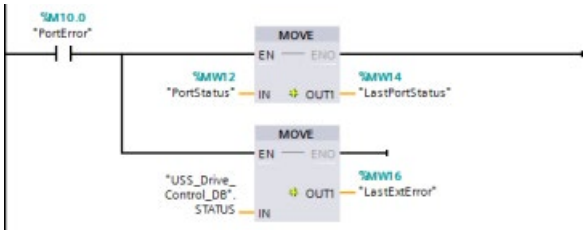
USS instruction status codes are returned at the STATUS output of the USS functions.

Table 13- 51 STATUS codes [1]



STATUS (W#16#....)	Description
0000	No error
8180	The length of the drive response did not match the characters received from the drive. The drive number where the error occurred is returned in the "USS_Extended_Error" variable. See the extended error description below this table.
8181	VALUE parameter was not a Word, Real or DWord data type.
8182	The user supplied a Word for a parameter value and received a DWord or Real from the drive in the response.
8183	The user supplied a DWord or Real for a parameter value and received a Word from the drive in the response.
8184	The response telegram from drive had a bad checksum. The drive number where the error occurred is returned in the "USS_Extended_Error" variable. See the extended error description below this table.
8185	Illegal drive address (valid drive address range: 1 to16)
8186	The speed set point is out of the valid range (valid speed SP range: -200% to 200%).
8187	The wrong drive number responded to the request sent. The drive number where the error occurred is returned in the "USS_Extended_Error" variable. See the extended error description below this table.
8188	Illegal PZD word length specified (valid range = 2, 4, 6 or 8 words)
8189	Illegal Baud Rate was specified.
818A	The parameter request channel is in use by another request for this drive.
818B	The drive has not responded to requests and retries. The drive number where the error occurred is returned in the "USS_Extended_Error" variable. See the extended error description below this table.
818C	The drive returned an extended error on a parameter request operation. See the extended error description below this table.
818D	The drive returned an illegal access error on a parameter request operation. See your drive manual for information of why parameter access may be limited.
818E	The drive has not been initialized. This error code is returned to USS_Read_Param or USS_Write_Param when USS_Drive_Control, for that drive, has not been called at least once. This keeps the initialization on first scan of USS_Drive_Control from overwriting a pending parameter read or write request, since it initializes the drive as a new entry. To fix this error, call USS_Drive_Control for this drive number.
80Ax-80Fx	Specific errors returned from PtP communication FBs called by the USS Library - These error code values are not modified by the USS library and are defined in the PtP instruction descriptions.

[1] In addition to the USS instruction errors listed above, errors can be returned from the underlying PtP communication instructions (Page 1088).



For several STATUS codes, additional information is provided in the "USS_Extended_Error" variable of the USS_Drive_Control Instance DB. For STATUS codes hexadecimal 8180, 8184, 8187, and 818B, USS_Extended_Error contains the drive number where the communication error occurred. For STATUS code hexadecimal 818C, USS_Extended_Error contains a drive error code returned from the drive when using a USS_Read_Param or USS_Write_Param instruction.

Example: Communication errors reporting

Communication errors (STATUS = 16#818B) are only reported on the USS_Port_Scan instruction and not on the USS_Drive_Control instruction. For example, if the network is not properly terminated, then it is possible for a drive to go to RUN but the USS_Drive_Control instruction will show all "0's' for the output parameters. In this case, you can only detect the communication error on the USS_Port_Scan instruction. Since this error is only visible for one scan, you will need to add some capture logic as illustrated in the following example. In this example, when the error bit of the USS_Port_Scan instruction is TRUE, then the STATUS and the USS_Extended_Error values are saved into M memory. The drive number is placed in the USS_Extended_Error variable when the STATUS code value is hexadecimal 8180, 8184, 8187, or 818B.

Network 1"PortStatus"port status and"USS_Drive_Control_DB".USS_Extended_Error
extended error code values are only valid for
one program scan. The values must be
captured for later processing.

Network 2 The "PortError" contact triggers the storage of the "PortStatus" value in "LastPortStatus" and the"USS_Drive_Control_DB".USS_Extended_Error
value in "LastExtError".

Read and write access to a drive's internal parameters

USS drives support read and write access to a drive's internal parameters. This feature allows remote control and configuration of the drive. Drive parameter access operations can fail due to errors such as values out of range or illegal requests for a drive's current mode. The drive generates an error code value that is returned in the "USS_Extended_Error" variable. This error code value is only valid for the last execution of a USS_Read_Param or USS_Write_Param instruction. The drive error code is put into USS_Extended_Error variable when the STATUS code value is hexadecimal 818C. The error code value of USS_Extended_Error depends on the drive model. See the drive's manual for a description of the extended error codes for read and write parameter operations.

13.4.5 USS general drive setup requirements

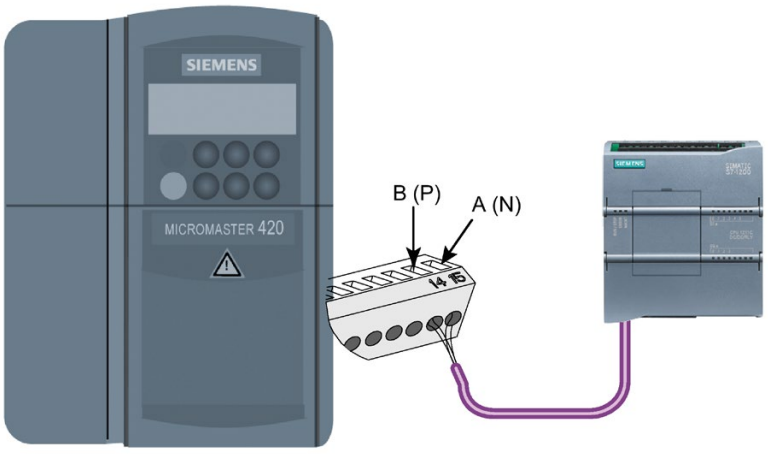
USS general drive setup requirements consist of the following points:

- The drives must be set to use 4 PKW words.
- The drives can be configured for 2, 4, 6, or 8 PZD words.
- The number of PZD word's in the drive must match PZD_LEN input on the USS_Drive_Control instruction for that drive.
- The baud rate in all the drives must match the BAUD input on the USS_Port_Scan instruction.
- The drive must be set for remote control.
- The drive must be set for frequency set-point to USS on COM Link.
- The drive address must be set to 1 to 16 and match the DRIVE input on the USS_Drive_Control block for that drive.
- The drive direction control must be set to use the polarity of the drive set-point.
- The RS485 network must be terminated properly.

13.4.6 Example: USS general drive connection and setup

Connecting a MicroMaster drive

This information about SIEMENS MicroMaster drives is provided as an example. For other drives, refer to the drive's manual for setup instructions.



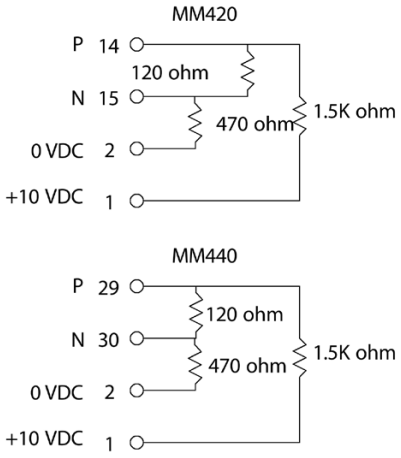
To make the connection to a MicroMaster Series 4 (MM4) drive, insert the ends of the RS485 cable into the two caged-clamp, screw-less terminals provided for USS operation. Standard PROFIBUS cable and connectors can be used to connect the S7-1200.

⚠ CAUTION

Interconnecting equipment with different reference potentials can cause unwanted currents to flow through the interconnecting cable

These unwanted currents can cause communications errors or damage equipment. Be sure all equipment that you are about to connect with a communications cable either shares a common circuit reference or is isolated to prevent unwanted current flows. The shield must be tied to chassis ground or pin 1 on the 9-pin connector. It is recommended that you tie wiring terminal 2-0 V on the MicroMaster drive to chassis ground.

The two wires at the opposite end of the RS485 cable must be inserted into the MM4 drive terminal blocks. To make the cable connection on a MM4 drive, remove the drive cover(s) to access the terminal blocks. See the MM4 user manual for details about how to remove the covers(s) of your specific drive.



The terminal block connections are labeled numerically. Using a PROFIBUS connector on the S7-1200 side, connect the A terminal of the cable to the drive terminal 15 (for an MM420) or terminal 30 (MM440). Connect the B terminal of B (P) A (N) the cable connector to terminal 14 (MM420) or terminal 29 (MM440).

If the S7-1200 is a terminating node in the network, or if the connection is point-to-point, it is necessary to use terminals A1 and B1 (not A2 and B2) of the connector since they allow the termination settings to be set (for example, with DP connector type 6ES7972-0BA40-0X40).

CAUTION
Replace drive covers properly before supplying power Make sure the drive covers are replaced properly before supplying power to the unit.

If the drive is configured as the terminating node in the network, then termination and bias resistors must also be wired to the appropriate terminal connections. This diagram shows examples of the MM4 drive connections necessary for termination and bias.

Setting up the MM4 drive

Before you connect a drive to the S7-1200, you must ensure that the drive has the following system parameters. Use the keypad on the drive to set the parameters:

1. Reset the drive to factory settings (optional).	P0010=30 P0970=1
If you skip step 1, then ensure that these parameters are set to the indicated values.	USS PZD length = P2012 Index 0=(2, 4, 6, or 8) USS PKW length = P2013 Index 0=4
2. Enable the read/write access to all parameters (Expert mode).	P0003=3
3. Check the motor settings for your drive. The settings will vary according to the motor(s) being used. To set the parameters P304, P305, P307, P310, and P311, you must first set parameter P010 to 1 (quick commissioning mode). When you are finished setting the parameters, set parameter P010 to 0. Parameters P304, P305, P307, P310, and P311 can only be changed in the quick commissioning mode.	P0304 = Rated motor voltage (V) P0305 = Rated motor current (A) P0307 = Rated motor power (W) P0310 = Rated motor frequency (Hz) P0311 = Rated motor speed
4. Set the local/remote control mode.	P0700 Index 0=5
5. Set selection of frequency set-point to USS on COM link.	P1000 Index 0=5
6. Ramp up time (optional) This is the time in seconds that it takes the motor to accelerate to maximum frequency.	P1120=(0 to 650.00)
7. Ramp down time (optional) This the time in seconds that it takes the motor to decelerate to a complete stop.	P1121=(0 to 650.00)
8. Set the serial link reference frequency:	P2000=(1 to 650 Hz)
9. Set the USS normalization:	P2009 Index 0=0

10. Set the baud rate of the RS485 serial interface:	P2010 Index 0= 4 (2400 baud) 5 (4800 baud) 6 (9600 baud) 7 (19200 baud 8 (38400 baud) 9 (57600 baud) 12 (115200 baud)
11. Enter the Slave address. Each drive (a maximum of 31) can be operated over the bus.	P2011 Index 0=(0 to 31)
12. Set the serial link timeout. This is the maximum permissible period between two incoming data telegrams. This feature is used to turn off the inverter in the event of a communications failure. Timing starts after a valid data telegram has been received. If a further data telegram is not received within the specified time period, the inverter will trip and display fault code F0070. Setting the value to zero switches off the control.	P2014 Index 0=(0 to 65,535 ms) 0=timeout disabled
13. Transfer the data from RAM to EEPROM:	P0971=1 (Start transfer) Save the changes to the parameter settings to EEPROM

13.5 Modbus communication

13.5.1 Overview of Modbus RTU and Modbus TCP communication

Modbus function codes

- A CPU operating as a Modbus RTU master (or Modbus TCP client) can read/write both data and I/O states in a remote Modbus RTU slave (or Modbus TCP server). Remote data can be read and then processed in your program logic.
- A CPU operating as a Modbus RTU slave (or Modbus TCP server) allows a supervisory device to read/write both data and I/O states in CPU memory. An RTU master (or Modbus TCP client) can write new values into slave/server CPU memory that is available to your program logic.

WARNING

If an attacker can physically access your networks, the attacker can possibly read and write data.

The TIA Portal, the CPU, and HMIs (except HMIs using GET/PUT) use secure communication that protects against replay and "man-in-the-middle" attacks. Once communication is enabled, the exchange of signed messages takes place in clear text which allows an attacker to read data, but protects against unauthorized writing of data. The TIA Portal, not the communication process, encrypts the data of know-how protected blocks.

All other forms of communication (I/O exchange through PROFIBUS, PROFINET, AS-i, or other I/O bus, GET/PUT, T-Block, and communication modules (CM)) have no security features. You must protect these forms of communication by limiting physical access. If an attacker can physically access your networks utilizing these forms of communication, the attacker can possibly read and write data.

For security information and recommendations, refer to the "Operational Guidelines for Industrial Security" (http://www.industry.siemens.com/topics/global/en/industrial-security/Documents/operational_guidelines_industrial_security_en.pdf).

Table 13- 52 Read data functions: Read remote I/O and program data

Modbus function code	Read slave (server) functions - standard addressing
01	Read output bits: 1 to 2000 bits per request
02	Read input bits: 1 to 2000 bits per request
03	Read Holding registers: 1 to 125 words per request
04	Read input words: 1 to 125 words per request

Table 13- 53 Write data functions: Write remote I/O and modify program data

Modbus function code	Write slave (server) functions - standard addressing
05	Write one output bit: 1 bit per request
06	Write one holding register: 1 word per request
15	Write one or more output bits: 1 to 1968 bits per request
16	Write one or more holding registers: 1 to 123 words per request

- Modbus function codes 08 and 11 provide slave device communication diagnostic information.
- Modbus function code 0 broadcasts a message to all slaves (with no slave response). The broadcast function is not available for Modbus TCP, because communication is connection based.

Table 13- 54 Modbus network station addresses

Station		Address
RTU station	Standard station address	1 to 247
	Extended station address	1 to 65535
TCP station	Station address	IP address and port number

Modbus memory addresses

The actual number of Modbus memory addresses available depends on the CPU model, how much work memory exists, and how much CPU memory is used by other program data. The table below gives the nominal value of the address range.

Table 13- 55 Modbus memory addresses

Station		Address range
RTU station	Standard memory address	10K
	Extended memory address	64K
TCP station	Standard memory address	10K

Modbus RTU communication

Modbus RTU (Remote Terminal Unit) is a standard network communication protocol that uses the RS232 or RS485 electrical connection for serial data transfer between Modbus network devices. You can add PtP (Point to Point) network ports to a CPU with a RS232 or RS485 CM or a RS485 CB.

Modbus RTU uses a master/slave network where all communications are initiated by a single Master device and slaves can only respond to a master's request. The master sends a request to one slave address and only that slave address responds to the command.

Modbus TCP communication

Modbus TCP (Transmission Control Protocol) is a standard network communication protocol that uses the PROFINET connector on the CPU for TCP/IP communication. No additional communication hardware module is required.

Modbus TCP uses Open User Communications (OUC) connections as a Modbus communication path. Multiple client-server connections may exist, in addition to the connection between STEP 7 and the CPU. Mixed client and server connections are supported up to the maximum number of connections allowed by the CPU model (Page 783).

Each MB_SERVER connection must use a unique instance DB and IP port number. Only 1 connection per IP port is supported. Each MB_SERVER (with its unique instance DB and IP port) must be executed individually for each connection.

A Modbus TCP client (master) must control the client-server connection with the DISCONNECT parameter. The basic Modbus client actions are shown below.

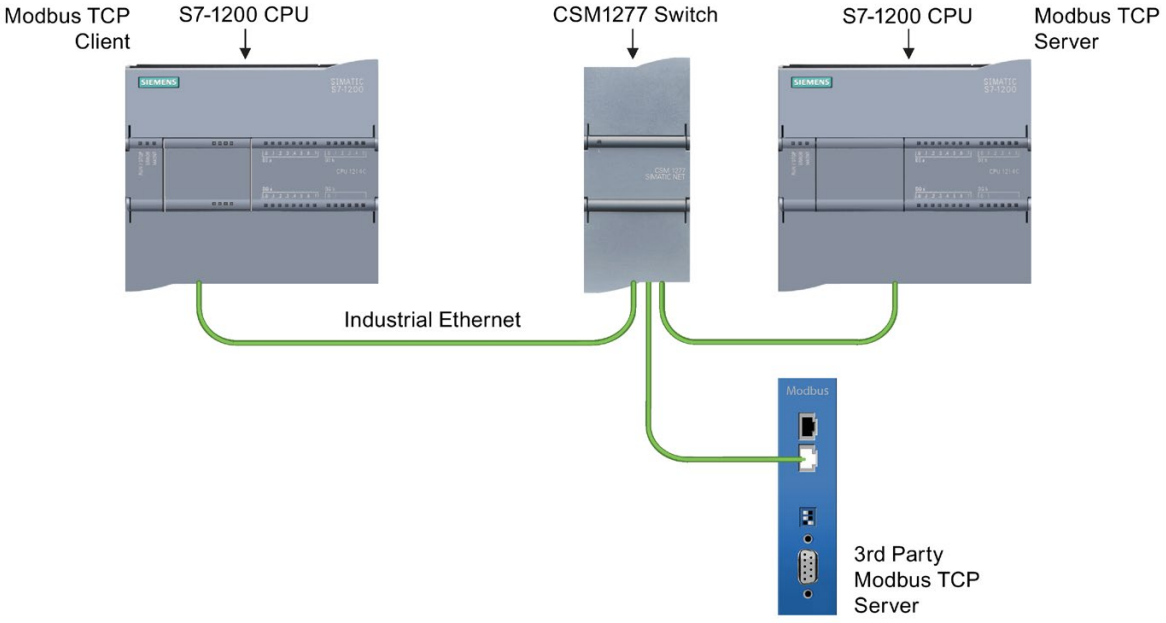
1. Initiate a connection to a particular server (slave) IP address and IP port number
2. Initiate client transmission of a Modbus message and receive the server responses
3. When desired, initiate the disconnection of client and server to enable connection with a different server.

Modbus RTU instructions in your program

- Modbus_Comm_Load: One execution of Modbus_Comm_Load is used to set up PtP port parameters like baud rate, parity, and flow control. After a CPU port is configured for the Modbus RTU protocol, it can only be used by either the Modbus_Master or Modbus_Slave instructions.
- Modbus_Master: The Modbus_Master instruction enables the CPU to act as a Modbus RTU master device and communicate with one or more Modbus slave devices.
- Modbus_Slave: The Modbus_Slave instruction enables the CPU to act as a Modbus RTU slave device and communicate with a Modbus master device.

Modbus TCP instructions in your program

- MB_CLIENT: Make client-server TCP connection, send command message, receive response, and control the disconnection from the server
- MB_SERVER: Connect to a Modbus TCP client upon request, receive Modbus message, and send response



13.5.2 Modbus TCP

13.5.2.1 Overview

As of version V4.1 of the S7-1200 CPU together with STEP 7 V13 SP1, the CPU extends the capability of Modbus TCP to use enhanced T-block instructions.

For this reason, the S7-1200 supports two sets of PtP instructions:

- Legacy Modbus TCP instructions (Page 1236): These Modbus TCP instructions existed prior to version V4.0 of the S7-1200.
- Modbus TCP instructions (Page 1151): These Modbus TCP instructions provide all of the functionality of the legacy instructions.

13.5.2.2 Selecting the version of the Modbus TCP instructions

There are three versions of the Modbus TCP instructions available in STEP 7:

- Legacy version 3.0: Compatible with all CPU and CP versions
- Legacy version 3.1: Compatible with all CPU and CP versions
- Version 4.1: Compatible with V4.0 and later CPUs and V2.1 and later CMs

For compatibility and ease of migration, you can choose which instruction version to insert into your user program.

Do not use both 3.0 and 3.1 instruction versions in the same CPU program. Your program's Modbus TCP instructions must have the same major version number (**1**.x, **2**.y, or **V**.z). The individual instructions within a major version group may have different minor versions (1.**x**).

Click the icon on the instruction tree task card to enable the headers and columns of the instruction tree.

To change the version of the Modbus TCP instructions, select the version from the drop-down list. You can select the group or individual instructions.

When you use the instruction tree to place a Modbus TCP instruction in your program, a new FB instance is created in the project tree. You can see new FB instance in the project tree under PLC_x > Program blocks > System blocks > Program resources.

To verify the version of a Modbus TCP instruction in a program, you must inspect project tree properties and not the properties of a box displayed in the program editor. Select a project tree Modbus TCP FB instance, right-click, select "Properties", and select the "Information" page to see the Modbus TCP instruction version number.

13.5.2.3 Modbus TCP instructions

MB_CLIENT (Communicate using PROFINET as Modbus TCP client) instruction

Table 13- 56 MB_CLIENT instruction

LAD / FBD	SCL	Description

	`"MB_CLIENT_DB"(`
	`REQ:=_bool_in_,`
	`DISCONNECT:=_bool_in_,`
	`MB_MODE:=_usint_in_,`
	`MB_DATA_ADDR:=_udint_in_,`
	`MB_DATA_LEN:=_uint_in_,`
	`DONE=>_bool_out_,`
	`BUSY=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`MB_DATA_PTR:=_variant_inout_,`
	`CONNECT:=_variant_inout_);`
		MB_CLIENT communicates as a Modbus TCP client through the PROFINET port on the S7-1200 CPU. No additional communication hardware module is required.
		MB_CLIENT can make a client-server connection, send a Modbus function request, receive a response, and control the disconnection from a Modbus TCP server.

Table 13- 57 Data types for the parameters

Parameter and type		Data type	Description
REQ	In	Bool	FALSE = No Modbus communication request TRUE = Request to communicate with a Modbus TCP server
DISCONNECT	IN	Bool	The DISCONNECT parameter allows your program to control connection and disconnection with a Modbus server device. If DISCONNECT = 0 and a connection does not exist, then MB_CLIENT attempts to make a connection to the assigned IP address and port number. If DISCONNECT = 1 and a connection exists, then a disconnect operation is attempted. Whenever this input is enabled, no other operation will be attempted.
MB_MODE	IN	USInt	Mode selection: Assigns the type of request (read, write, or diagnostic). See the Modbus functions table below for details.
MB_DATA_ADDR	IN	UDInt	Modbus starting Address: Assigns the starting address of the data to be accessed by MB_CLIENT. See the following Modbus functions table for valid addresses.
MB_DATA_LEN	IN	UInt	Modbus data Length: Assigns the number of bits or words to be accessed in this request. See the following Modbus functions table for valid lengths
MB_DATA_PTR	IN_OUT	Variant	Pointer to the Modbus data register: The register buffers data going to or coming from a Modbus server. The pointer must assign a non-optimized global DB or an M memory address.
CONNECT	IN_OUT	Variant	Reference to a Data block structure that contains connection parameters in the system data type "TCON_IP_v4".
DONE	OUT	Bool	The DONE bit is TRUE for one scan, after the last request was completed with no error.
BUSY	OUT	Bool	• 0 - No MB_CLIENT operation in progress • 1 - MB_CLIENT operation in progress
ERROR	OUT	Bool	The ERROR bit is TRUE for one scan, after the MB_CLIENT execution ended with an error. The error code at the STATUS parameter is valid only during the single cycle where ERROR = TRUE.
STATUS	OUT	Word	Execution condition code

Note

CPU firmware version requirement

The Modbus TCP instructions described in this section of the manual require firmware release V4.1 or later.

REQ parameter

FALSE = No Modbus communication request
TRUE = Request to communicate with a Modbus TCP server

If no instance of MB_CLIENT is active and parameter DISCONNECT=0, when REQ=1 a new Modbus request starts. If the connection is not already established, then a new connection is made.

If the same instance of MB_CLIENT is executed again with DISCONNECT=0 and REQ=1, before the completion of the current request, then no subsequent Modbus transmission will be made. However, as soon as the current request is completed, a new request can be processed if MB_CLIENT is executed with REQ=1.

When the current MB_CLIENT communication request is complete, the DONE bit is TRUE for one cycle. The DONE bit can be used as a time gate to sequence multiple MB_CLIENT requests.

Note

Input data consistency during MB_CLIENT processing

Once a Modbus client initiates a Modbus operation, all the input states are saved internally and are then compared on each successive call. The comparison is used to determine if this particular call was the originator of the active client request. More than one MB_CLIENT call can be performed using a common instance DB.

It is important that the inputs are not changed during the period of time that an MB_CLIENT operation is actively being processed. If this rule is not followed, then an MB_CLIENT cannot determine the active instance.

MB_MODE and MB_DATA_ADDR parameters select the Modbus communication function

The MB_CLIENT instruction uses an MB_MODE input rather than a function code. MB_DATA_ADDR assigns the starting Modbus address of the remote data.

The combination of MB_MODE and MB_DATA_ADDR determines the function code that is used in the actual Modbus message. The following table shows the correspondence between parameter MB_MODE, MB_DATA_ADDR, and Modbus function:

Table 13- 58 Modbus functions

MB_MODE	Modbus function	Data length	Operation and data	MB_DATA_ADDR
0	01	1 to 2000	Read output bits: 1 to 2000 bits per request	1 to 9999
101	01	1 to 2000	Read output bits: 1 to 2000 bits per request	00000 to 65535
0	02	1 to 2000	Read input bits: 1 to 2000 bits per request	10001 to 19999
102	02	1 to 2000	Read input bits: 1 to 2000 bits per request	00000 to 65535
0	03	1 to 125	Read Holding registers: 1 to 125 words per request	40001 to 49999 or 400001 to 465535
103	03	1 to 125	Read Holding registers: 1 to 125 words per request	00000 to 65535
0	04	1 to 125	Read input words: 1 to 125 words per request	30001 to 39999
104	04	1 to 125	Read input words: 1 to 125 words per request	00000 to 65535
1	05	1	Write one output bit: One bit per request	1 to 9999
105	05	1	Write one output bit: One bit per request	00000 to 65535
1	06	1	Write one holding register: 1 word per request	40001 to 49999 or 400001 to 465535
106	06	1	Write one holding register: 1 word per request	00000 to 65535
1	15	2 to 1968	Write multiple output bits: 2 to 1968 bits per request	1 to 9999
1	16	2 to 123	Write multiple holding registers: 2 to 123 words per request	40001 to 49999 or 400001 to 465535
2	15	1 to 1968	Write one or more output bits: 1 to 1968 bits per request	1 to 9999
2	15	1 to 1968	Write one or more output bits: 1 to 1968 bits per request	1 to 9999
2	15	1 to 1968	Write one or more output bits: 1 to 1968 bits per request	1 to 9999
115	15	1 to 1968	Write one or more output bits: 1 to 1968 bits per request	00000 to 65535

MB_MODE	Modbus function	Data length	Operation and data	MB_DATA_ADDR
2	16	1 to 123	Write one or more holding registers: 1 to 123 words per request	40001 to 49999 or 400001 to 465535
116	16	1 to 123	Write one or more holding registers: 1 to 123 words per request	00000 to 65535
11	11	0	Read the server communication status word and event counter. The status word indicates busy (0 = not busy, 0xFFFF = busy). The event counter is incremented for each successful completion of a message. Both the MB_DATA_ADDR and MB_DATA_LEN parameters of MB_CLIENT are ignored for this function.	
80	08	1	Check server status with diagnostic code 0x0000 (Loopback test, server echoes the request) 1 word per request	
81	08	1	Reset server event counter with diagnostic code 0x000A 1 word per request	
3 to 10, 12 to 79, 82 to 100, 107 to 114, 117 to 255			Reserved	

Note

MB_DATA_PTR assigns a buffer to store data read/written to/from a Modbus TCP server

The data buffer can be located in a non-optimized global DB or M memory address.

For a buffer in M memory, use the Any Pointer format. This is in the format P#"Bit Address" "Data Type" "Length", an example would be P#M1000.0 WORD 500.

MB_DATA_PTR parameter assigns a communication buffer

- MB_CLIENT communication functions:
  - Read and write 1-bit data from Modbus server addresses (00001 to 09999)
  - Read 1-bit data from Modbus server addresses (10001 to 19999)
  - Read 16-bit word data from Modbus server addresses (30001 to 39999) and (40001 to 49999)
  - Write 16-bit word data to Modbus server addresses (40001 to 49999)
- Word or bit sized data is transferred to/from the DB or M memory buffer assigned by MB_DATA_PTR.
- If a DB is assigned as the buffer by MB_DATA_PTR, then you must assign data types to all DB data elements.
  - The 1-bit Bool data type represents one Modbus bit address
  - 16-bit single word data types like WORD, UInt, and Int represent one Modbus word address
  - 32-bit double word data types like DWORD, DInt, and Real represent two Modbus word addresses
- Complex DB elements can be assigned by MB_DATA_PTR, such as
  - Arrays
  - Named structures where each element is unique.
  - Named complex structures where each element has a unique name and a 16 or 32 bit data type.
- No requirement that the MB_DATA_PTR data areas be in the same global data block (or M memory area). You can assign one data block for Modbus reads, another data block for Modbus writes, or one data block for each MB_CLIENT.

CONNECT parameter assigns data used to establish a PROFINET connection

You must use a global data block and store the required connection data before you can reference this DB at the CONNECT parameter.

1. Create a new global DB or use an existing global DB to store the CONNECT data. You can use one DB to store multiple TCON_IP_v4 data structures. Each Modbus TCP client or server connection uses a TCON_IP_v4 data structure. You reference the connection data at the CONNECT parameter.
2. Name the DB and a static variable with a helpful name. For example, name the data block "Modbus connections" and a static variable "TCPactive_1" (for Modbus TCP client connection 1).
3. In the DB editor, assign the system data type "TCON_IP_v4" in the Data Type column, for the example static variable "TCPactive_1".
4. Expand the TCON_IP_v4 structure so you can modify the connection parameters, as shown in the following image.
5. Modify data in the TCON_IP_v4 structure for an MB_CLIENT connection.
6. Enter the DB structure reference for the CONNECT parameter of MB_CLIENT. For the example, this would be "Modbus connections".TCPactive_1.

Modbus connections

		Name	Data type	Start value	Comment
1		Static			
2		TCPactive_1	TCON_IP_v4		
3		InterfaceId	HW_ANY	64	HW-identifier of IE-interface submodule
4		ID	CONN_OUC	1	connection reference / identifier
5		ConnectionType	Byte	16#0B	type of connetion: 11=TCP/IP, 19=UDP (17=TC...
6		ActiveEstablished	Bool	True	active/passive connection establishment
7		RemoteAddress	IP_V4		remote IP address (IPv4)
8		ADDR	array [1..4] of Byte		IPv4 address
9		ADDR[1]	Byte	192	
10		ADDR[2]	Byte	168	
11		ADDR[3]	Byte	2	
12		ADDR[4]	Byte	241	
13		RemotePort	UInt	502	remote UDP/TCP port number
14		LocalPort	UInt	0	local UDP/TCP port number

Modify TCP_IP_v4 DB data for each MB_CLIENT connection

- **InterfaceID**: Using the Device configuration window, click on the CPU PROFINET port image. Then click on the General properties tab and use the Hardware identifier that you see there.
- **ID**: Enter a connection ID number between 1 and 4095. Modbus TCP communication is made using underlying TCON, TDISCON, TSEND, and TRCV instructions, for OUC (Open User Communication).
- **ConnectionType**: For TCP/IP, use the default 16#0B (decimal number = 11).
- **ActiveEstablished**: This value must be 1 or TRUE. The connection is active in that MB_CLIENT initiates Modbus communication.
- **RemoteAddress**: Enter the IP address of the target Modbus TCP server into the four ADDR array elements. For example, enter 192.168.2.241, as in the previous image.

- **RemotePort**: The default is 502. This number is the IP port number of the Modbus server that MB_CLIENT attempts to connect and communicate with. Some third-party Modbus servers require that you use another port number.
- **LocalPort**: This value must be 0, for an MB_CLIENT connection.

Multiple client connections

A Modbus TCP client can support concurrent connections up to the maximum number of Open User Communications connections allowed by the PLC. The total number of connections for a PLC, including Modbus TCP Clients and Servers, must not exceed the maximum number of supported Open User Communications connections (Page 783).

Individual concurrent client connections must follow these rules:

- Each MB_CLIENT connection must use a unique instance DB
- Each MB_CLIENT connection must assign a unique server IP address
- Each MB_CLIENT connection must assign a unique connection ID
- Unique IP port numbers may or may not be required depending upon the server configuration

A different connection ID must be used with each instance DB. In summary, the instance DB and the connection ID are paired together and must be unique for each connection.

Table 13- 59 MB_CLIENT instance data block: User accessible static variables

Variable	Data type	Default	description
Blocked_Proc_Timeout	Real	3.0	Amount of time (in seconds) to wait upon a blocked Modbus client instance before removing this instance as being ACTIVE. This can occur, for example, when a client request has been issued and then application stops executing the client function before completely finishing the request. The maximum S7-1200 limit is 55 seconds.
MB_Unit_ID	Word	255	Modbus unit identifier: A Modbus TCP server is addressed using its IP address. As a result, the MB_UNIT_ID parameter is not used for Modbus TCP addressing. The MB_UNIT_ID parameter corresponds to the slave address in the Modbus RTU protocol. If a Modbus TCP server is used for a gateway to a Modbus RTU protocol, the MB_UNIT_ID can be used to identify the slave device connected on the serial network. The MB_UNIT_ID would be used to forward the request to the correct Modbus RTU slave address. Some Modbus TCP devices may require the MB_UNIT_ID parameter to be within a restricted range.
RCV_TIMEOUT	Real	2.0	Time in seconds that the MB_CLIENT waits for a server to respond to a request.
Connected	Bool	0	Indicates whether the connection to the assigned server is connected or disconnected: 1=connected, 0=disconnected

Table 13- 60 MB_CLIENT protocol errors

STATUS (W#16#)	Response code to Modbus client (B#16#)	Modbus protocol errors
8381	01	Function code not supported
8382	03	Data length error
8383	02	Data address error or access outside the bounds of the MB_HOLD_REG address area
8384	03	Data value error
8385	03	Data diagnostic code not supported (function code 08)

Table 13- 61 MB_CLIENT execution condition codes [1]

STATUS (W#16#)	MB_CLIENT parameter errors
7001	MB_CLIENT is waiting for a Modbus server response to a connect or disconnect request, on the assigned TCP port. This code is only returned for the first execution of a connect or disconnect operation.
7002	MB_CLIENT is waiting for a Modbus server response to a connect or disconnect request, for the assigned TCP port. This will be returned for any subsequent executions, while waiting for completion of a connect or disconnect operation.
7003	A disconnect operation has successfully completed (Only valid for one PLC scan).
80C8	The server has not responded in the assigned time. MB_CLIENT must receive a response using the transaction ID that was originally transmitted within the assigned time or this error is returned. Check the connection to the Modbus server device. This error is only returned after retries (if applicable) have been attempted.
8188	Invalid mode
8189	Invalid data address
818A	Invalid data length
818B	Invalid pointer to the DATA_PTR area. This can be the combination of MB_DATA_ADDRESS + MB_DATA_LEN.
818C	Pointer DATA_PTR points to an non-optimized DB area (must be a non-optimized DB area or M memory area)
8200	The port is busy processing an existing Modbus request.
8380	Received Modbus frame is incorrect or too few bytes have been received.
8387	The assigned Connection ID parameter is different from the ID used for previous requests. There can only be a single Connection ID used within each MB_CLIENT instance DB. This code is also returned as an internal error if the Modbus TCP protocol ID received from a server is not 0.
8388	A Modbus server returned a quantity of data that is different than what was requested. This code applies to Modbus functions 15 or 16 only.

[1] In addition to the MB_CLIENT errors listed above, errors can be returned from the underlying T block communication instructions (TCON, TDISCON, TSEND, and TRCV).

MB_SERVER (Communicate using PROFINET as Modbus TCP server) instruction

Table 13- 62 MB_SERVER instruction

LAD / FBD	SCL	Description

	`"MB_SERVER_DB"(`
	`DISCONNECT:=_bool_in_,`
	`CONNECT:=_variant_in_,`
	`NDR=>_bool_out_,`
	`DR=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	
	`MB_HOLD_REG:=_variant_inout_);`
		MB_SERVER communicates as a Modbus TCP server through the PROFINET port on the S7-1200 CPU. No additional communication hardware module is required.
		MB_SERVER can accept a request to connect with Modbus TCP client, receive a Modbus function request, and send a response message.

Table 13- 63 Data types for the parameters

Parameter and type		Data type	Description
DISCONNECT	IN	Bool	MB_SERVER attempts to make a "passive" connection with a partner device. This means that the server is passively listening for a TCP connection request from any requesting IP address. If DISCONNECT = 0 and a connection does not exist, then a passive connection can be initiated. If DISCONNECT = 1 and a connection exists, then a disconnect operation is initiated. This parameter allows your program to control when a connection is accepted. Whenever this input is enabled, no other operation will be attempted.
CONNECT	IN	Variant	Reference to a Data block structure that contains connection parameters in the system data type "TCON_IP_v4".
MB_HOLD_REG	IN_OUT	Variant	Pointer to the MB_SERVER Modbus holding register: The holding register must either be a non-optimized global DB or an M memory address. This memory area is used to hold the data a Modbus client is allowed to access using Modbus register functions 3 (read), 6 (write), 16 (write), and 23 (write/read).
NDR	OUT	Bool	New Data Ready: 0 = No new data, 1 = Indicates that new data has been written by a Modbus client
DR	OUT	Bool	Data Read: 0 = No data read, 1 = Indicates that data has been read by a Modbus client.
ERROR	OUT	Bool	The ERROR bit is TRUE for one scan, after MB_SERVER execution ended with an error. The error code at the STATUS parameter is valid only during the single cycle where ERROR = TRUE.
STATUS	OUT	Word	Execution condition code

Note

CPU firmware version requirement

The Modbus TCP instructions described in this section of the manual require firmware release V4.1 or later.

Note

Using Function 23 with the MB_SERVER instruction

The MB_SERVER instruction supports the use of function code 23 for writing to and reading from a holding register in a single request; however, the MB_CLIENT instruction does NOT support this function and returns an error code. You should also note that while the request contains both the read and write, the instruction processes the write before the read.

CONNECT parameter assigns data used to establish a PROFINET connection

You must use a global data block and store the required connection data before you can reference this DB at the CONNECT parameter.

1. Create a new global DB or use an existing global DB to store the CONNECT data. You can use one DB to store multiple TCON_IP_v4 data structures. Each Modbus TCP client or server connection uses a TCON_IP_v4 data structure. You reference the connection data at the CONNECT parameter.
2. Name the DB and a static variable with a helpful name. For example, name the data block "Modbus connections" and a static variable "TCPpassive_1" (for Modbus TCP server connection 1).
3. In the DB editor, assign the system data type "TCON_IP_v4" in the Data Type column, for the example static variable "TCPactive_1".
4. Expand the TCON_IP_v4 structure so you can modify the connection parameters, as shown in the following image.
5. Modify data in the TCON_IP_v4 structure for an MB_SERVER connection.
6. Enter the DB structure reference for the CONNECT parameter of MB_SEVER. For the example, this would be "Modbus connections".TCPpassive_1.

Modbus connections

	Name	Data type	Start value	Comment
1	Static			
2	TCPpassive_1	TCON_IP_v4		
3	InterfaceId	HW_ANY	64	HW-identifier of IE-interface submodule
4	ID	CONN_OUC	1	connection reference / identifier
5	ConnectionType	Byte	16#0B	type of connetion: 11=TCP/IP, 19=UDP (17=TC...
6	ActiveEstablished	Bool	False	active/passive connection establishment
7	RemoteAddress	IP_V4		remote IP address (IPv4)
8	ADDR	array [1..4] of Byte		IPv4 address
9	ADDR[1]	Byte	192	
10	ADDR[2]	Byte	168	
11	ADDR[3]	Byte	2	
12	ADDR[4]	Byte	241	
13	RemotePort	UInt	0	remote UDP/TCP port number
14	LocalPort	UInt	502	local UDP/TCP port number

Modify TCP_IP_v4 DB data for each MB_SERVER connection

- **InterfaceID**: Using the Device configuration window, click on the CPU PROFINET port image. Then click on the General properties tab and use the Hardware identifier that you see there.
- **ID**: Enter a number between 1 and 4095 that is unique for this connection. Modbus TCP communication is made using underlying TCON, TDISCON, TSEND, and TRCV instructions, for OUC (Open User Communication). Up to eight simultaneous OUC connections are allowed.
- **ConnectionType**: For TCP/IP, use the default 16#0B (decimal value = 11).
- **ActiveEstablished**: This value must be 0 or FALSE. The connection is passive in that MB_SERVER is waiting for a communication request from a Modbus client.
- **RemoteAddress**: There are two options.
  - Use 0.0.0.0 and MB_CLIENT will respond to a Modbus request from any TCP client
  - Enter the IP address of a target Modbus TCP client and MB_CLIENT only responds to a request originating from this client's IP address. For example, enter 192.168.2.241, as in the previous image.
- **RemotePort**: This value must be 0, for an MB_SERVER connection.
- **LocalPort**: The default is 502. This number is the IP port number of the Modbus client that MB_SERVER attempts to connect and communicate with. Some third-party Modbus clients require another port number.

Modbus and process image addresses

MB_SERVER allows incoming Modbus function codes (1, 2, 4, 5, and 15) to read/write bits/words directly in the input/output process image. For data transfer function codes (3, 6, and 16), the MB_HOLD_REG parameter must be defined as a data type larger than a byte. The following table shows the mapping of Modbus addresses to the process image in the CPU.

Table 13- 64 Mapping of Modbus addresses to the process image

Modbus functions						S7-1200	
Codes	Function	Data area	Address range			Data area	CPU address
01	Read bits	Output	1	To	8192	Output Process Image	Q0.0 to Q1023.7
02	Read bits	Input	10001	To	18192	Input Process Image	I0.0 to I1023.7
04	Read words	Input	30001	To	30512	Input Process Image	IW0 to IW1022
05	Write bit	Output	1	To	8192	Output Process Image	Q0.0 to Q1023.7
15	Write bits	Output	1	To	8192	Output Process Image	Q0.0 to Q1023.7

Incoming Modbus message function codes function codes (3, 6, and 16) read/write words in a Modbus holding register, which can be in M memory or a data block. The type of holding register is specified by the MB_HOLD_REG parameter.

Note

MB_HOLD_REG parameter assignment

Modbus holding registers defined as arrays of word, integer, wide character, unsigned integer, byte, short integer, unsigned short integer, character, double word, double integer, unsigned double integer, or real can be placed in any memory area.

You must place Modbus holding registers that you defined as structures in non-optimized DBs.

For a Modbus holding register in M memory, use the Any Pointer format. This is in the format P#"Bit Address" "Data Type" "Length". An example would be P#M1000.0 WORD 500.

The following table shows examples of Modbus addresses to holding register mapping used for Modbus function codes 03 (read words), 06 (write word), and 16 (write words). The actual upper limit of DB addresses is determined by the maximum work memory limit and M memory limit, for each CPU model.

Table 13- 65 Mapping examples of Modbus address to CPU memory address

Modbus Address	MB_HOLD_REG parameter examples		
	P#M100.0 Word 5	P#DB10.DBx0.0 Word 5	"Recipe".ingredient
40001	MW100	DB10.DBW0	"Recipe".ingredient[1]
40002	MW102	DB10.DBW2	"Recipe".ingredient[2]
40003	MW104	DB10.DBW4	"Recipe".ingredient[3]
40004	MW106	DB10.DBW6	"Recipe".ingredient[4]
40005	MW108	DB10.DBW8	"Recipe".ingredient[5]

Multiple server connections

Multiple server connections may be created. A single PLC can establish concurrent connections to multiple Modbus TCP clients.

A Modbus TCP server can support concurrent connections up to the maximum number of Open User Communications connections allowed by the PLC. The total number of connections for a PLC, including Modbus TCP Clients and Servers, must not exceed the maximum number of supported Open User Communications connections (Page 783). The Modbus TCP connections may be shared between Client and Server type connections.

Individual concurrent server connection must follow these rules:

- Each MB_SERVER connection must use a unique instance DB.
- Each MB_SERVER connection must assign a unique IP port number. Only 1 connection per port is supported.
- Each MB_SERVER connection must assign a unique connection ID.
- The MB_SERVER must be called individually for each connection (with its respective instance DB).

The connection ID must be unique for each individual connection. A single, connection ID must be used with each individual instance DB. The instance DB and the connection ID are paired together and must be unique for every connection.

Table 13- 66 Modbus diagnostic function codes

MB_SERVER Modbus diagnostic functions		
Codes	Sub-function	Description
08	0x0000	Return query data echo test: The MB_SERVER will echo back to a Modbus client a data word that is received.
08	0x000A	Clear communication event counter: The MB_SEVER will clear the communication event counter that is used for Modbus function 11.
11		Get communication event counter: The MB_SERVER uses an internal communication event counter for recording the number of successful Modbus read and write requests that are sent to the Modbus server. The counter does not increment on any request for Function 8, Function 11, or any request that results in a communication error. The broadcast function is not available for Modbus TCP, because only one client-server connection exists at any one time.

MB_SERVER instruction data block (DB) variables

This table shows the public static variables that are stored in the MB_SERVER instance data block and can be used in your program

Table 13- 67 MB_SERVER public static variables

Variable	Data type	Default	Description
HR_Start_Offset	Word	0	Assigns the starting address of the Modbus Holding register
Request_Count	Word	0	The number of all requests received by this server.
Server_Message_Count	Word	0	The number of requests received for this specific server.
Xmt_Rcv_Count	Word	0	The number of transmissions or receptions that have encountered an error. Also, incremented if a message is received that is an invalid Modbus message.
Exception_Count	Word	0	Modbus specific errors that require a returned exception
Success_Count	Word	0	The number of requests received for this specific server that has no protocol errors.
Connected	Bool	0	Indicates whether the connection to the assigned client is connected or disconnected: 1=connected, 0=disconnected
QB_Start	UInt	0	The starting address of the output bytes to which the CPU can write (QB0 to QB65535)
QB_Count	UInt	65535	The number of bytes to which a remote device can write. If QB_Count = 0, a remote device cannot write to the outputs. Example: To allow only QB10 through QB17 to be writable, QB_Start = 10 and QB_Count = 8.
QB_Read_Start	UInt	0	The starting address of the output bytes to which the CPU can read (QB0 to QB65535)
QB_Read_Count	UInt	65535	The number of output bytes from which a remote device can read. If QB_Count = 0, a remote device cannot read from the outputs. Example: To allow only QB10 through QB17 to be readable, QB_Start = 10 and QB_Count = 8.
IB_Read_Start	UInt	0	The starting address of the input bytes to which the CPU can read (IB0 to IB65535)
IB_Read_Count	UInt	65535	The number of input bytes from which a remote device can read. If IB_Count = 0, a remote device cannot read from the inputs. Example: To allow only IB10 through IB17 to be readable, IB_Start = 10 and IB_Count = 8.
NDR_immediate	Bool	FALSE	Identical meaning as the parameter NDR (New Data Ready). The MB_SERVER updates the "NDR_immediate" in the same call that processes a Modbus TCP write request.
DR_immediate	Bool	FALSE	Identical meaning as the parameter DR (Data Read). The MB_SERVER updates the "DR_immediate" in the same call that processes a Modbus TCP write request.

Your program can write data to the HR_Start_Offset and control Modbus server operations. The other variables can be read to monitor Modbus status.

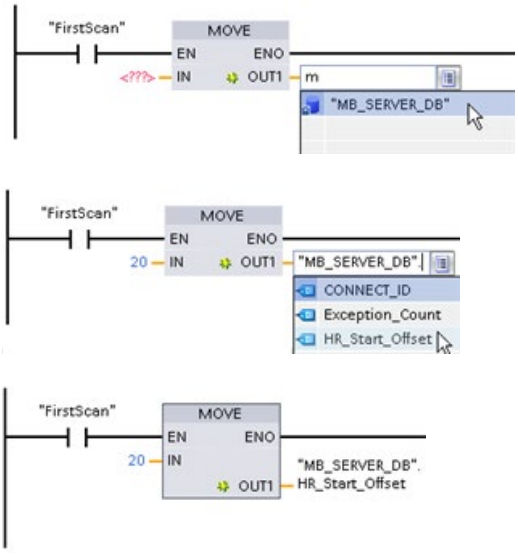
Version requirements for MB_SERVER instruction data block (DB) variables availability are as follows:

Table 13- 68 MB_SERVER instruction data block (DB) variables availability version requirements: Instruction, TIA Portal, and S7-1200 CPU

MB_SERVER instruction version	TIA Portal version	S7-1200 CPU firmware (FW) version	Data block variables
4.0	V14 SP1	CPU FW V4.0 or later	QB_Start
			QB_Count
5.0	V15.1	CPU FW V4.2 or later	QB_Start
			QB_Count
			QB_Read_Start
			QB_Read_Count
			IB_Read_Start
			IB_Read_Count
			NDR_immediate
			DR_immediate

HR_Start_Offset

Modbus holding register addresses begin at 40001. These addresses correspond to the beginning PLC memory address of the holding register. However, you can use the "HR_Start_Offset" variable to start the beginning Modbus holding register address at another number instead of 40001.



For example, if the holding register starts at MW100 and is 100 words long. An offset of 20 specifies a beginning holding register address of 40021 instead of 40001. Any address less than 40021 or greater than 40119 results in an addressing error.

Table 13- 69 Example of Modbus holding register addressing

HR_Start_Offset	Address	Minimum	Maximum
0	Modbus address (Word)	40001	40099
	S7-1200 address	MW100	MW298
20	Modbus address (Word)	40021	40119
	S7-1200 address	MW100	MW298

HR_Start_Offset is word data in the MB_SERVER instance data block that assigns the starting address of the Modbus holding register. You can set this public static variable by using the parameter helper drop list, after MB_SERVER is placed in your program.

For example, after you place MB_SERVER in a LAD network, you can go to a previous network and assign HR_Start_Offset. The start address must be assigned prior to execution of MB_SERVER.

Entering a Modbus server variable using the default DB name:

1. Set the cursor in the parameter field and type an m character.
2. Select "MB_SERVER_DB" from the drop list of DB names.
3. Select "MB_SERVER_DB.HR_Start_Offset" from the drop list of DB variables.

Access to data areas in data blocks (DB) instead of direct access to Modbus addresses

As of version V5.0 of the MB_SERVER instruction and firmware (FW) version V4.2 of the S7-1200 CPU, you can access data areas in DBs instead of directly accessing process images and holding registers. In order to do this, in the global DB "Attributes" Property page, you must deselect the "Only store in load memory" and "Optimized block access" check boxes.

If a Modbus request arrives and you did not define a data area for the Modbus data type of the corresponding function code, the CPU treats the request as in previous instruction versions: You access process images and holding registers directly.

If you have defined a data area for the Modbus data type of the function code, the MB_SERVER instruction reads from or writes to that data area. Whether it reads or writes depends on the job type.

For one individual Modbus request, you can only read from or write to one data area. If, for example, you want to read holding registers that extend over multiple data areas, you require multiple Modbus requests.

These are the rules for defining data areas:

- You can define up to eight data areas in different DBs; each DB must only contain one data area. An individual MODBUS request can only read from precisely one data area or write to precisely one data area. Each data area corresponds to one MODBUS address area. You define the data areas in the "Data_Area_Array" static tag of the instance DB.
- If you want to use less than eight data areas, you must place the required data areas one behind the other, without any gaps. The first blank entry in the data areas ends the data area search during processing. If, for example, you define the field elements 1, 2, 4, and 5, the "Data_Area_Array" only recognizes field elements 1 and 2. as field element 3 is empty.
- The Data_Area_Array field consists of eight elements: Data_Area_Array[1] to Data_Area_Array[8]
- Each field element Data_Area_Array[x], 1 <= x <= 8, is a UDT of the type MB_DataArea and is structured as follows:

Parameter	Data type	Meaning
data_ type	UInt	Identifier for the MODBUS data type that is mapped to this data area: • 0: Identifier for an empty field element or an unused data area. In this case, the values of db, start and length are irrelevant. • 1: Process image output (used with function codes 1, 5, and 15) • 2: Process image input (used with function code 2) • 3: Holding register (used with function codes 3, 6, and 16) • 4: Input register (used with function code 4) Note: If you have defined a data area for a MODBUS data type, the instruction MB_SERVER can no longer access this MODBUS data type directly. If the address of a MODBUS request for such a data type does not correspond to a defined data area, a value of W#16#8383 is returned in STATUS.
db	UInt	Number of the data block to which the MODBUS register or bits subsequently defined are mapped The DB number must be unique in the data areas. The same DB number must not be defined in multiple data areas. Inthe global DB "Attributes" Property page, you must deselect the "Only store in load memory" and "Optimized block access" check boxes. Data areas also start with the byte address 0 of the DB. Permitted values: 1 to 60999
start	UInt	First MODBUS address that is mapped to the data block starting from address 0.0 Permitted values: 0 to 65535
length	UInt	Number of bits (for the values 1 and 2 of data_type) or number of registers (for the values 3 and 4 of data_type) The MODBUS address areas of one and the same MODBUS data type must not overlap. Permitted values: 1 to 65535

Examples of the definition of data areas:

- First example: data_type = 3, db = 1, start = 10, length = 6

  The CPU maps the holding registers (data_type = 3) in data block 1 (db = 1), placing the Modbus address 10 (start = 10) at data word 0 and the last valid Modbus address 15 (length = 6) at data word 5.

- Second example: data_type = 2, db = 15, start = 1700, length = 112

  The CPU maps the inputs (data_type = 2) in data block 15 (db = 15), placing the Modbus address 1700 (start = 1700) at data word 0 and the last valid Modbus address 1811 (length = 112) at data word 111.

Condition codes

Table 13- 70 MB_SERVER execution condition codes [1]

STATUS (W#16#)	Response code to Modbus server (B#16#)	Modbus protocol errors
7001		MB_SERVER is waiting for a Modbus client to connect to the assigned TCP port. This code is returned on the first execution of a connect or disconnect operation.
7002		MB_SERVER is waiting for a Modbus client to connect to the assigned TCP port. This code is returned for any subsequent executions, while waiting for completion of a connect or disconnect operation.
7003		A disconnect operation has successfully completed (Only valid for one PLC scan).
8187		MB_HOLD_REG is not valid, could be pointing into an optimized DB, or is pointing to an area of less than 2 bytes.
818C		Pointer MB_HOLD_REG points to a non-optimized DB area (must be a non-optimized global DB area or M memory area) or Blocked process timeout exceeds the limit of 55 seconds. (S7-1200 specific)
8381	01	Function code not supported
8382	03	Data length error
8383	02	Data address error or access outside the bounds of the MB_HOLD_REG address area
8384	03	Data value error
8385	03	Data diagnostic code not supported (function code 08)

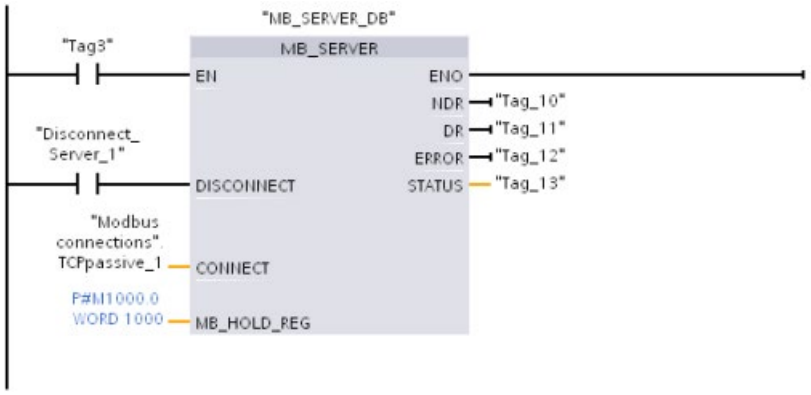
[1] In addition to the MB_SERVER errors listed above, errors can be returned from the underlying T block communication instructions (TCON, TDISCON, TSEND, and TRCV).

13.5.2.4 Modbus TCP examples

Example: MB_SERVER Multiple TCP connections

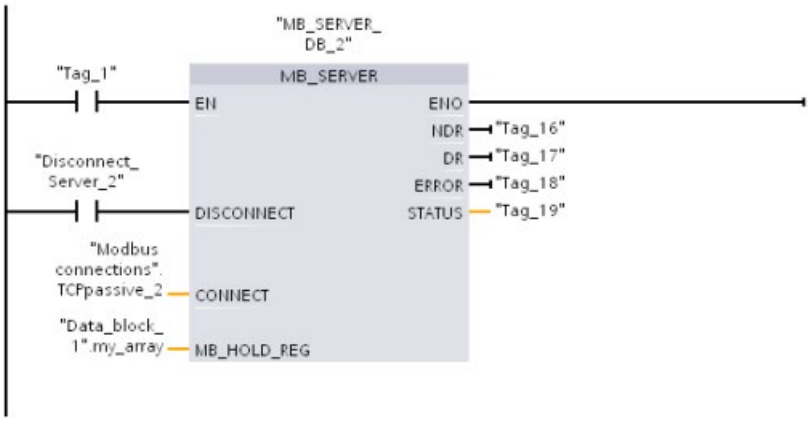
You can have multiple Modbus TCP server connections. To accomplish this, MB_SERVER must be independently executed for each connection. Each connection must use an independent instance DB, connection ID, and IP port. The S7-1200 allows only one connection per IP port.

For best performance, MB_SERVER should be executed every program cycle, for each connection.



The CONNECT parameter uses system data type TCP_IP_v4.For the example, these data structures are in a DB named "Modbus connections". The "Modbus connections" DB contains two TCP_IP_v4 structures "TCPpassive_1" (for connection 1) and "TCP_passive_2" (for connection 2).The connection properties ID and LocalPort described in the network comments are data elements stored in the CONNECT data structure.

The TCP_IP_v4 CONNECT data also contains an IP address in the RemoteAddress ADDR array. IP address assignments within TCPpassive_1 and TCP_passive_2 do not affect the establishment of TCP server connections, but determine which Modbus TCP clients are allowed to communicate though the connections to each MB_SERVER. MB_SERVER passively listens for a modbus client message and compares the incoming message IP address with the IP address stored in the corresponding RemoteAddress ADDR array.

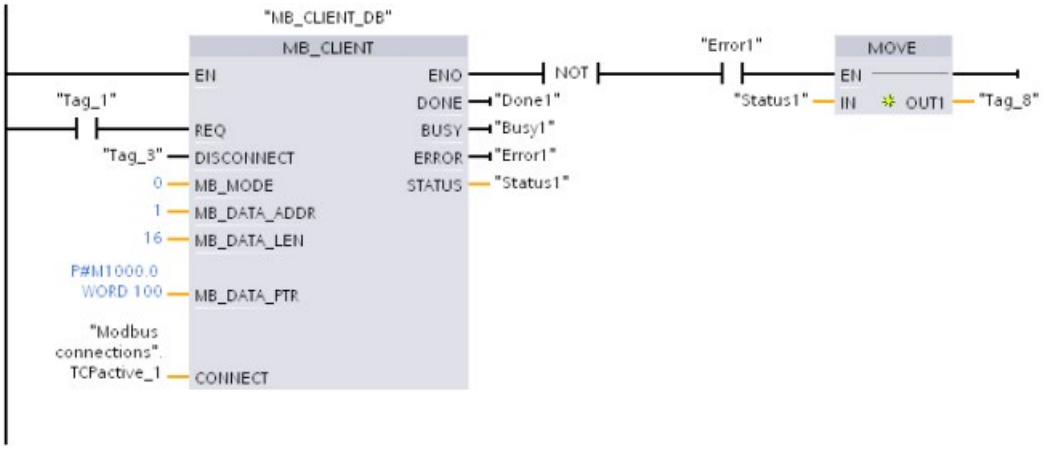


Three MB_SERVER IP address variations are possible for the two MB_SERVER instructions:

- **IP address = 0.0.0.0**
  Each MB_SERVER will respond to all Modbus TCP clients using any IP address.
- **IP address = Same IP address in TCPpassive_1 and TCPpassive_2**
  Both MB_SERVER connections only respond to Modbus clients originating from this IP address.
- **IP address = Different IP number in TCP_passive_1 and TCP_passive_2**
  Each MB_SERVER only responds to Modbus clients that originate from the IP address stored in their TCP_IP_v4 data.

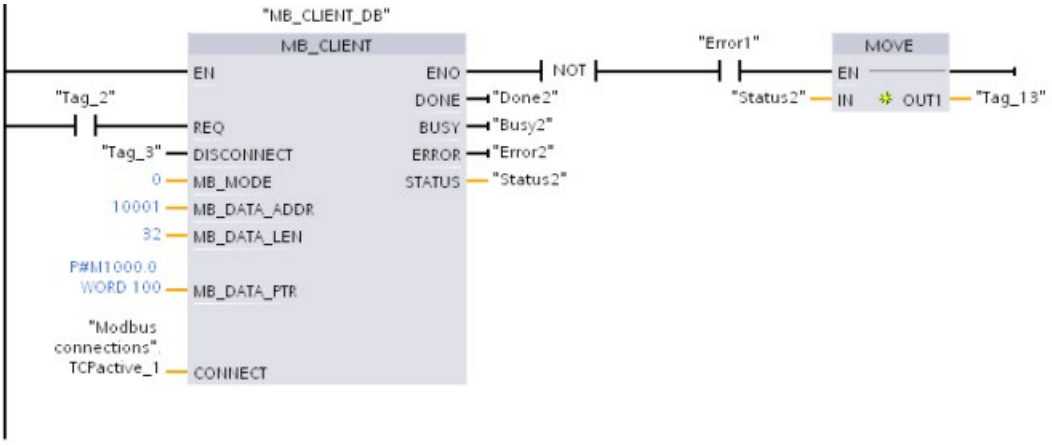
Network 1: Connection #1, Instance DB = "MB_SERVER_DB", within "Modbus connections.TCPpassive_1" (ID = 1 and LocalPort = 502)

Network 2: Connection #2, Instance DB = "MB_SERVER_DB_1, within "Modbus connections.TCPpassive_2" (ID = 2 and LocalPort = 503)



Example: MB_CLIENT 1: Multiple requests with common TCP connection

Multiple Modbus client requests can be sent over the same connection. To accomplish this, use the same instance DB, connection ID, and port number.

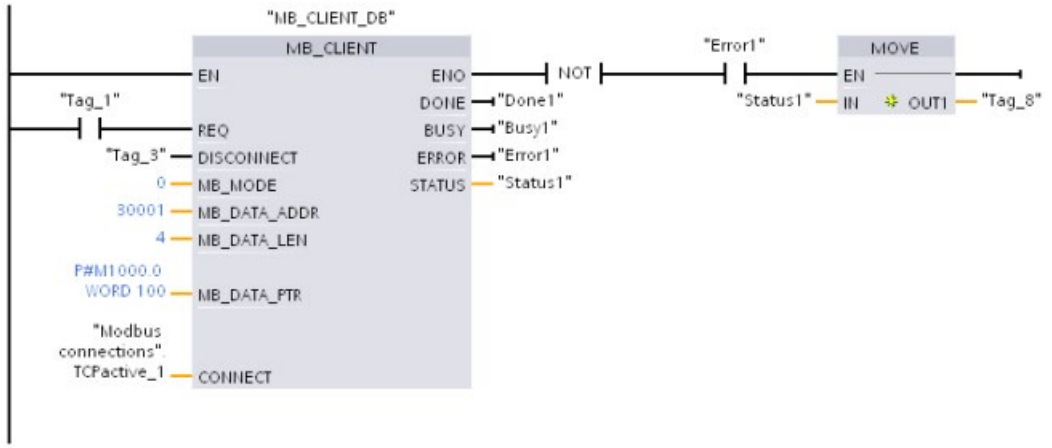


Because both MB_CLIENT boxes use the same CONNECT parameter TCON_IP_v4 data structure ("Modbus_connections".TCPactive_1), the connection ID, port number, and IP address are identical. The CONNECT IP address data assigns the IP address, of the target Modbus TCP server.

Only one MB_CLIENT can be active at any given time. Once a client completes its execution, the next client can begin execution. Your program logic is responsible for the execution sequence logic. The example shows both clients reading remote data from a single Modbus client and transferring the data to the Modbus client's CPU (M memory starting at M1000.0). A returned error is captured, which is optional.

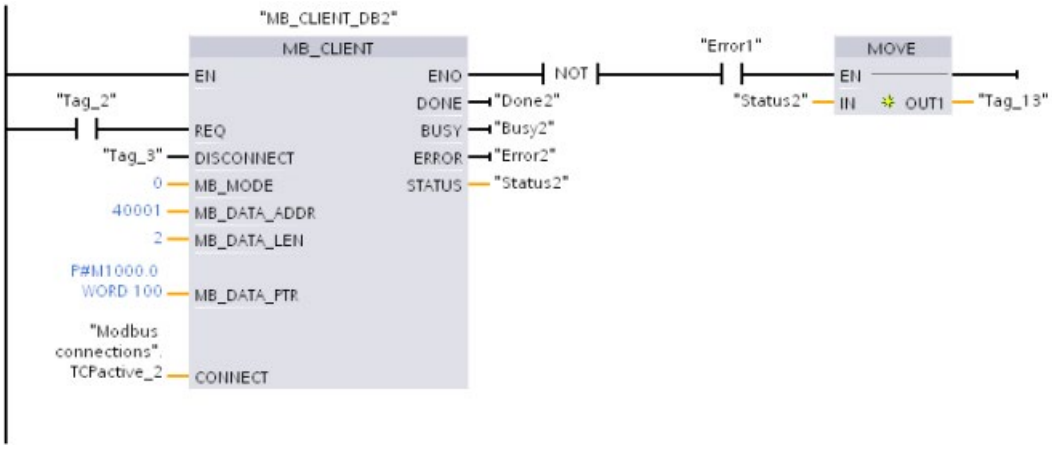
Network 1: Modbus function 1 - Read 16 output bits from a Modbus TCP server with the IP address assigned in "Modbus connections".TCPactive_1.

Network 2: Modbus function 2 - Read 32 input bits from a Modbus TCP server with the IP address assigned in "Modbus connections".TCPactive_1.



Example: MB_CLIENT 2: Multiple requests with different TCP connections

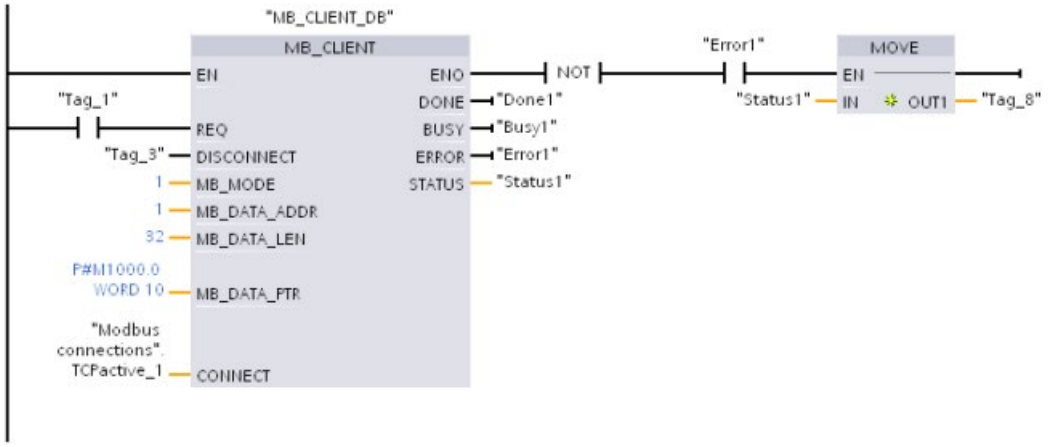
Modbus TCP client requests can be sent over different connections. To accomplish this, different instance DBs and connection IDs must be used.



The RemotePort (IP port) number must be different, if the connections are established to the same Modbus server. If the connections are on different servers, there is no IP port number restriction.

The example shows two Modbus TCP clients transferring remote data from two different Modbus TCP servers to the same local CPU memory area, starting at address M1000.0. Also, a returned error is captured which is optional.

Network 1: Modbus function 4 - Read input process image words from a Modbus TCP server CONNECT parameter = "Modbus connections".TCPactive_1: Connection **ID** = 1, **RemoteAddress** = 192.168.2.241, **RemotePort** = 502

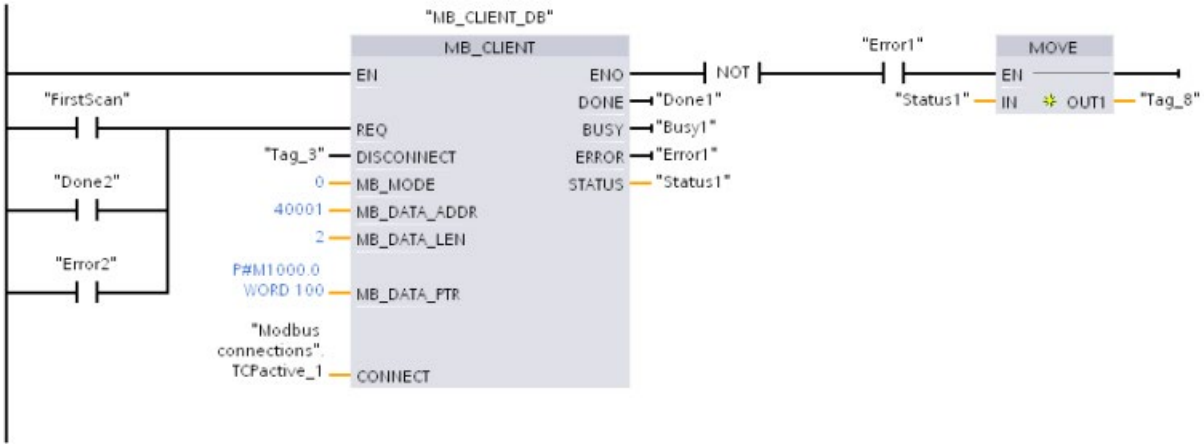


Network 2: Modbus function 3 - Read holding register words from a Modbus TCP server
CONNECT parameter = "Modbus connections".TCPactive_2: Connection **ID** = 2, **RemoteAddress** = 192.168.2.242, **RemotePort** = 502

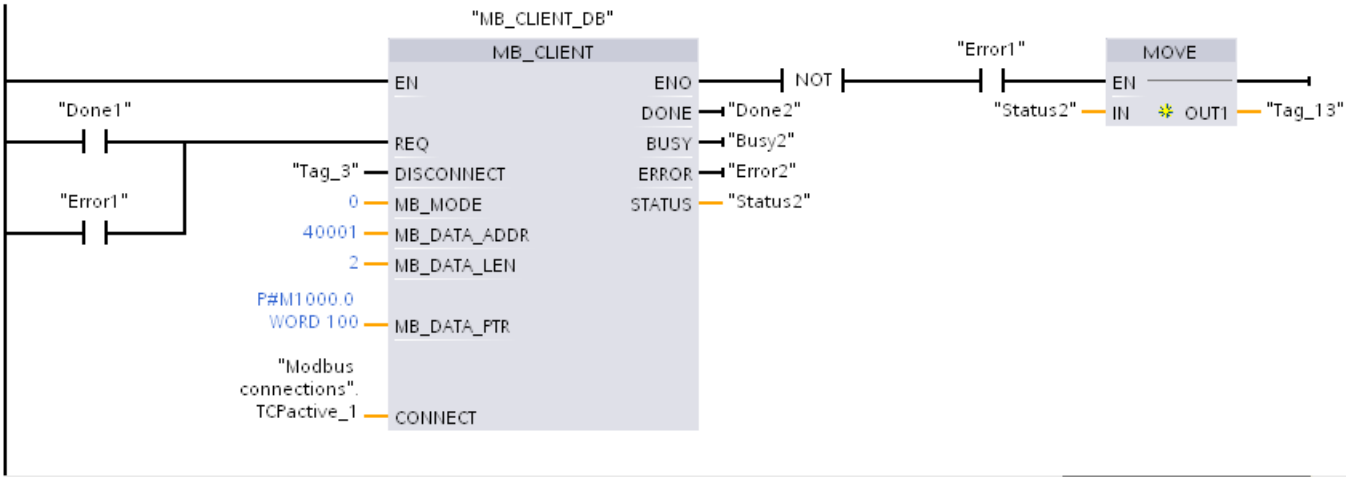
Example: MB_CLIENT 3: Output image write request

This example shows a Modbus client request that transfers bit data from local CPU memory (starting at M1000.0) to a remote Modbus TCP server.

Network 1: Modbus function 15 - Write output bits in a Modbus server



Example: MB_CLIENT 4: Coordinating multiple requests



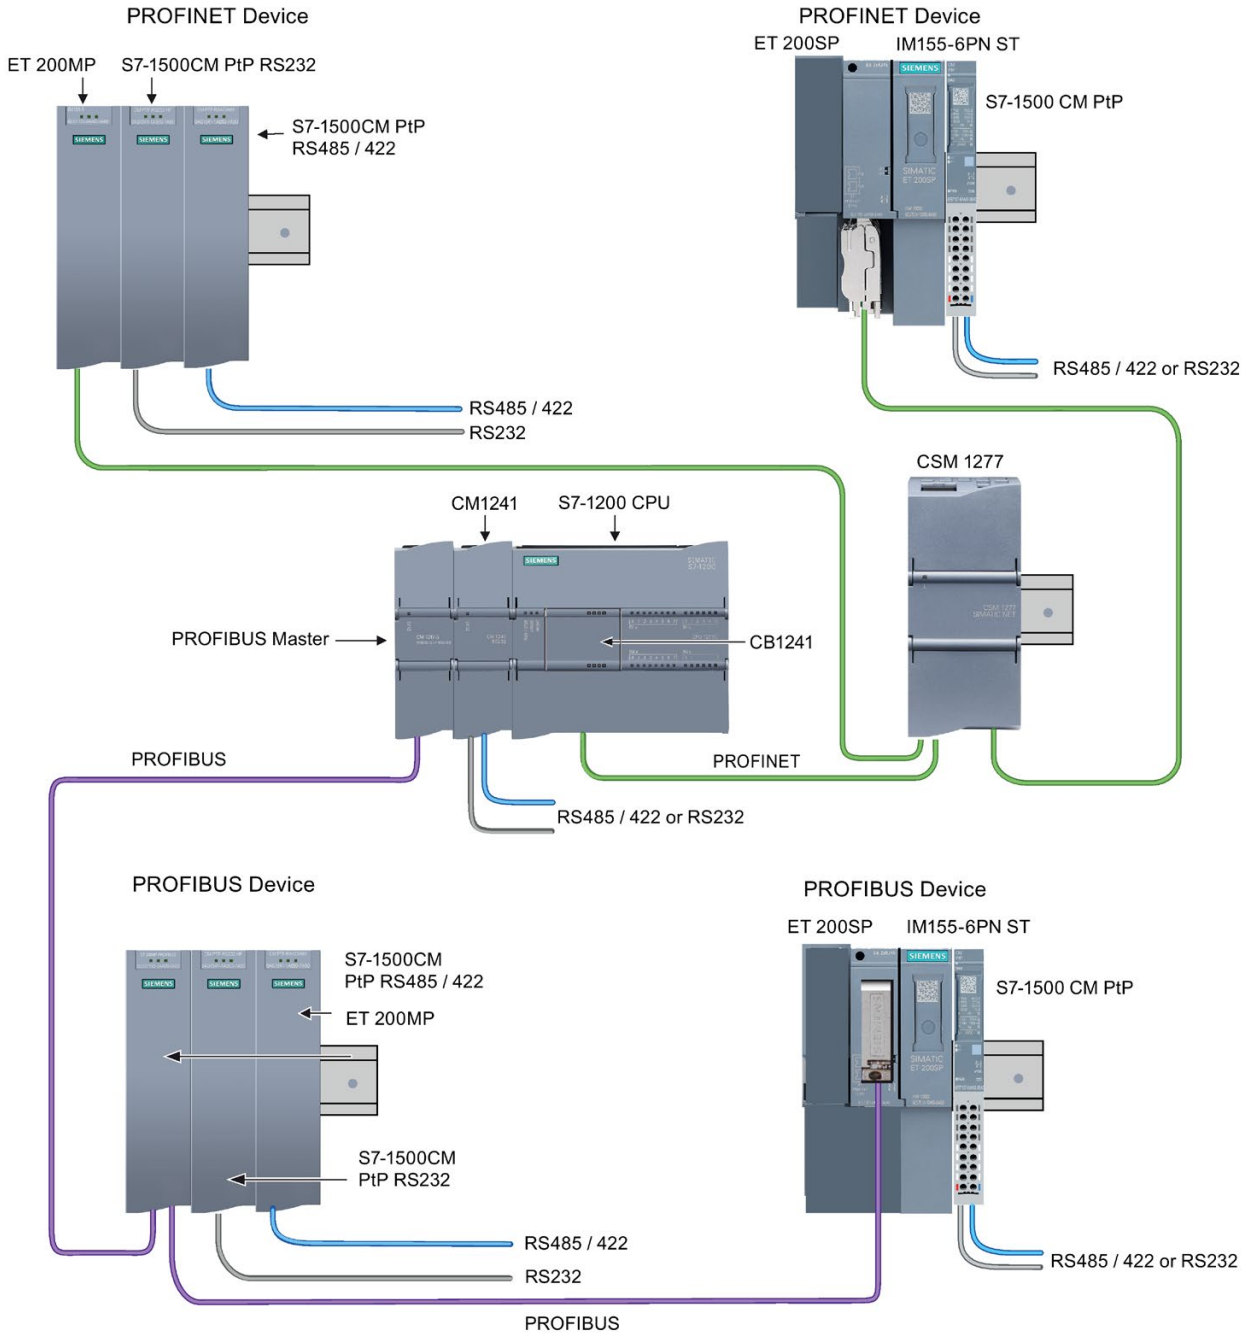
You must ensure that each individual Modbus TCP request finishes execution. The execution sequence must be controlled by your program logic. The example below shows how the outputs of the first and second client requests can control the execution sequence.

The example shows both clients using the same CONNECT connection data (used at different times). The clients transfer holding register data from the same remote Modbus TCP server to the same local CPU memory M address. Also, a returned error is captured which is optional.

Network 1: Modbus function 3 - Read Modbus TCP server holding register words

Network 2: Modbus function 3 - Read Modbus TCP server holding register words

13.5.3 Modbus RTU



13.5.3.1 Overview

As of version V4.1 of the S7-1200 CPU together with STEP 7 V13 SP1, the CPU extends the capability of Modbus RTU to use a PROFINET or PROFIBUS distributed I/O rack to communicate to various devices (RFID readers, GPS device, and others):

- PROFINET (Page 786): You connect the Ethernet interface of the S7-1200 CPU to a PROFINET interface module. PtP communication modules in the rack with the interface module can then provide serial communications to the PtP devices.
- PROFIBUS (Page 947): You insert a PROFIBUS communication module in the left side of the rack with the S7-1200 CPU. You connect the PROFIBUS communication module to a rack containing a PROFIBUS interface module. PtP communication modules in the rack with the interface module can then provide serial communications to the PtP devices.

For this reason, the S7-1200 supports two sets of PtP instructions:

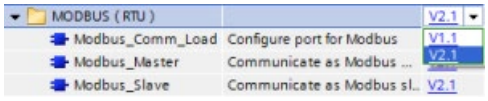
- Legacy Modbus RTU instructions (Page 1254): These Modbus RTU instructions existed prior to version V4.0 of the S7-1200 and only work with serial communications using a CM 1241 communication module or CB 1241 communication board.
- Modbus RTU instructions (Page 1178): These Modbus RTU instructions provide all of the functionality of the legacy instructions, plus the ability to connect to PROFINET and PROFIBUS distributed I/O. These Modbus RTU instructions allow you to configure the communications between the PtP communication modules in the distributed I/O rack and the PtP devices. S7-1200 CM 1241 modules must have a minimum firmware version of V2.1 to use these Modbus RTU instructions.

Note

With version V4.1 of the S7-1200, you can use the point-to-point instructions for all types of point-to-point communication: serial, serial over PROFINET, and serial over PROFIBUS. STEP 7 provides the legacy point-to-point instructions only to support existing programs. The legacy instructions still function, however, with V4.1 CPUs as well as V4.0 and earlier CPUs. You do not have to convert prior programs from one set of instructions to the other.

13.5.3.2 Selecting the version of the Modbus RTU instructions

There are three versions of the Modbus RTU instructions available in STEP 7:



- Version 1.1: Compatible with V4.0 and later CPUs and V2.1 and later CMs
- Version 2.1: Compatible with V4.0 and later CPUs and V2.1 and later CMs
- Version 3.0: Compatible with V4.0 and later CPUs and V2.1 and later CMs

For compatibility and ease of migration, you can choose which instruction version to insert into your user program.

You cannot use both versions of the instructions with the same module, but two different modules can use different versions of the instructions. Do not use both 1.x and 2.y instruction versions in the same CPU program. Your program's Modbus RTU instructions must have the same major version number (**1**.x, **2**.y, or **V**.z). The individual instructions within a major version group may have different minor versions (1.**x**).

Click the icon on the instruction tree task card to enable the headers and columns of the instruction tree.

To change the version of the Modbus RTU instructions, select the version from the drop-down list. You can select the group or individual instructions.

When you use the instruction tree to place a Modbus RTU instruction in your program, a new FB instance is created in the project tree. You can see new FB instance in the project tree under PLC_x > Program blocks > System blocks > Program resources.

To verify the version of a Modbus RTU instruction in a program, you must inspect project tree properties and not the properties of a box displayed in the program editor. Select a project tree Modbus RTU FB instance, right-click, select "Properties", and select the "Information" page to see the Modbus RTU instruction version number.

13.5.3.3 Maximum number of supported Modbus slaves

Modbus addressing supports a maximum of 247 slaves (slave numbers 1 through 247). Each Modbus network segment can have a maximum of 32 devices, based upon the loading and drive capabilities of the RS485 interface. When you reach the 32-device limit, you must use a repeater to expand to the next segment. You need seven repeaters to support the 247 slaves connected to one master for RS485.

Siemens repeaters work only with PROFIBUS; their function is to monitor PROFIBUS token passing. You cannot use Siemens repeaters with other protocols. Therefore, you require third party repeaters for Modbus.

Modbus timeouts are long by default; the use of multiple repeaters does not create a time-delay problem. The Modbus master does not care if a slave is slow to respond or if multiple repeaters delay the response.

13.5.3.4 Modbus RTU instructions

Modbus_Comm_Load (Configure SIPLUS I/O or port on the PtP module for Modbus RTU) instruction

Table 13- 71 Modbus_Comm_Load instruction

LAD / FBD	SCL	Description

	`"Modbus_Comm_Load_DB"(`
	`REQ:=_bool_in,`
	`PORT:=_uint_in_,`
	`BAUD:=_udint_in_,`
	`PARITY:=_uint_in_,`
	`FLOW_CTRL:=_uint_in_,`
	`RTS_ON_DLY:=_uint_in_,`
	`RTS_OFF_DLY:=_uint_in_,`
	`RESP_TO:=_uint_in_,`
	`DONE=>_bool_out,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`MB_DB:=_fbtref_inout_);`
		The Modbus_Comm_Load instruction configures SIPLUS I/O or a PtP port for Modbus RTU protocol communications.
		Modbus RTU port hardware options: Install up to three CMs (RS485 or RS232), plus one CB (R4845).
		Modbus RTU SIPLUS I/O options: Install ET 200MP S7-1500CM PtP (RS485 / 422 or RS232) or ET 200SP S7-1500 CM PtP (RS485 / 422 or RS232)
		An instance data block is assigned automatically when you place the Modbus_Comm_Load instruction in your program.

Table 13- 72 Data types for the parameters

Parameter and type		Data type	Description
EN	IN	Bool	Note: The Modbus RTU, Modbus_Comm_Load instruction uses the RDREC and WRREC instructions to initialize the PTP module. However, the RDREC/WRREC instruction works asynchronously, which means that it takes several scans for the instruction to complete. Therefore, you must hold the EN parameter of the Modbus_Comm_Load instruction true until completion of the RDREC/WRREC instruction.
REQ	IN	Bool	A low to high (positive edge) signal starts the operation. (Version 2.0 only)
PORT	IN	Port	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table.
BAUD	IN	UDInt	Baud rate selection: 300, 600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, 76800, 115200, all other values are invalid
PARITY	IN	UInt	Parity selection: • 0 – None • 1 – Odd • 2 – Even
FLOW_CTRL [1]	IN	UInt	Flow control selection: • 0 – (default) no flow control • 1 – Hardware flow control with RTS always ON (does not apply to RS485 ports) • 2 – Hardware flow control with RTS switched
RTS_ON_DLY [1]	IN	UInt	RTS ON delay selection: • 0 – (default) No delay from RTS active until the first character of the message is transmitted • 1 to 65535 – Delay in milliseconds from RTS active until the first character of the message is transmitted (does not apply to RS485 ports). RTS delays shall be applied independent of the FLOW_CTRL selection.
RTS_OFF_DLY [1]	IN	UInt	RTS OFF delay selection: • 0 – (default) No delay from the last character transmitted until RTS goes inactive • 1 to 65535 – Delay in milliseconds from the last character transmitted until RTS goes inactive (does not apply to RS485 ports). RTS delays shall be applied independent of the FLOW_CTRL selection.
RESP_TO [1]	IN	UInt	Response timeout: Time in milliseconds allowed by the Modbus_Master for the slave to respond. If the slave does not respond in this time period, the Modbus_Master will retry the request or terminate the request with an error when the specified number of retries has been sent. 5 ms to 65535 ms (default value = 1000 ms).

Parameter and type		Data type	Description
MB_DB	IN	Variant	A reference to the instance data block used by the Modbus_Master or Modbus_Slave instructions. After Modbus_Master or Modbus_Slave is placed in your program, the DB identifier appears in the parameter helper drop-list available at the MB_DB box connection.
DONE	OUT	Bool	The DONE bit is TRUE for one scan, after the last request was completed with no error. (Version 2.0 only)
ERROR	OUT	Bool	The ERROR bit is TRUE for one scan, after the last request was terminated with an error. The error code value at the STATUS parameter is valid only during the single scan where ERROR = TRUE.
STATUS	OUT	Word	Execution condition code

[1] Optional parameters for Modbus_Comm_Load (V 2.x or later). Click the arrow at the bottom of a LAD/FBD box to expand the box and include these parameters.

Modbus_Comm_Load is executed to configure a port for the Modbus RTU protocol. Once a port is configured for the Modbus RTU protocol, it can only be used by either the Modbus_Master or Modbus_Slave instructions.

One execution of Modbus_Comm_Load must be used to configure each communication port that is used for Modbus communication. Assign a unique Modbus_Comm_Load instance DB for each port that you use. You can install up to three communication modules (RS232 or RS485) and one communication board (RS485) in the CPU. Call Modbus_Comm_Load from a startup OB and execute it one time or use the first scan system flag (Page 108) to initiate the call to execute it one time. Only execute Modbus_Comm_Load again if communication parameters like baud rate or parity must change.

If you use the Modbus library with a module in a distributed rack, the Modbus_Comm_Load instruction must be executed in a cyclical interrupt routine (for example, once per second or once every 10 seconds). If power is lost to the distributed rack or the module is pulled, upon restoration of module operation, only the HWConfig parameter set is sent to the PtP module. All requests initiated by the Modbus_Master timeout, and the Modbus_Slave goes silent (no response to any message). Cyclic execution of the Modbus_Comm_Load instruction resolves these issues.

An instance data block is assigned for Modbus_Master or Modbus_Slave when you place these instructions in your program. This instance data block is referenced when you specify the MB_DB parameter for the Modbus_Comm_Load instruction.

Modbus_Comm_Load instance data block (DB) tags

The following table shows the public static tags stored in the Modbus_Comm_Load instance DB that can be used in your program:

Table 13- 73 Modbus_Comm_Load instance DB static tags

Tag	Data type	Default	Description
ICHAR_GAP	Word	0	Maximum character delay time between characters. This parameter is specified in milliseconds and increases the anticipated period between the received characters. The corresponding number of bit times for this parameter is added to the Modbus default value of 35 bit times (3.5 character times).
RETRIES	Word	2	Number of retries that the master executes before the error code 0x80C8 for "No response" is returned.
EN_SUPPLY_VOLT	Bool	0	Enable diagnostics for missing supply voltage L+.
MODE	USInt	0	Operating mode Valid operating modes are as follows: • 0 = Full duplex (RS232) • 1 = Full duplex (RS422) four-wire mode (point-to-point) • 2 = Full duplex (RS422) four-wire mode (multipoint master, CM PtP (ET 200SP)) • 3 = Full duplex (RS422) four-wire mode (multipoint slave, CM PtP (ET 200SP)) • 4 = Half duplex (RS485) two-wire mode (See Note below.)
LINE_PRE	USInt	0	Receive line initial state Valid initial states are as follows: • 0 = "No" initial state (See Note below.) • 1 = signal R(A) = 5 V DC, signal R(B) = 0 V DC (break detection): Break detection is possible with this initial state. Can only be selected with: "Full duplex (RS422) four-wire mode (point-to-point connection)" and "Full duplex (RS422) four-wire mode (multipoint slave)". • 2 = signal R(A) = 0 V DC, signal R(B) = 5 V DC: This default setting corresponds to the idle state (no active send operation). No break detection is possible with this initial state.
BRK_DET	USInt	0	Break detection The following selections are valid: • 0 = break detection deactivated • 1 = break detection activated

Tag	Data type	Default	Description
EN_DIAG_ALARM	Bool	0	Activate diagnostics interrupt: • 0 = not activated • 1 = activated
STOP_BITS	USInt	1	Number of stop bits: • 1 = 1 stop bit • 2 = 2 stop bits • 0, 3 to 255 = reserved

Note

Required setting for the use of PROFIBUS cables with CM 1241 for RS485

Table 13- 74 Modbus_Comm_Load execution condition codes [1]

STATUS (W#16#)	Description
0000	No error
8180	Invalid port ID value (wrong port/hardware identifier for communication module)
8181	Invalid baud rate value
8182	Invalid parity value
8183	Invalid flow control value
8184	Invalid response timeout value (response timeout less than the 5 ms minimum)
8185	MB_DB parameter is not an instance data block of a Modbus_Master or Modbus_Slave instruction.

[1] In addition to the Modbus_Comm_Load errors listed above, errors can be returned from the underlying PtP communication instructions.

Modbus_Master (Communicate using SIPLUS I/O or the PtP port as Modbus RTU master) instruction

Table 13- 75 Modbus_Master instruction

LAD / FBD	SCL	Description

	`"Modbus_Master_DB"(`
	`REQ:=_bool_in_,`
	`MB_ADDR:=_uint_in_,`
	`MODE:=_usint_in_,`
	`DATA_ADDR:=_udint_in_,`
	`DATA_LEN:=_uint_in_,`
	`DONE=>_bool_out_,`
	`BUSY=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`DATA_PTR:=_variant_inout_);`
		The Modbus_Master instruction communicates as a Modbus master using a port that was configured by a previous execution of the Modbus_Comm_Load instruction. An instance data block is assigned automatically when you place the Modbus_Master instruction in your program. This Modbus_Master instance data block is used when you specify the MB_DB parameter for the Modbus_Comm_Load instruction.

Table 13- 76 Data types for the parameters

Parameter and type		Data type	Description
REQ	IN	Bool	0=No request 1= Request to transmit data to Modbus slave
MB_ADDR	IN	V1.0: USInt V2.0: UInt	Modbus RTU station address: Standard addressing range (1 to 247) Extended addressing range (1 to 65535) The value of 0 is reserved for broadcasting a message to all Modbus slaves. Modbus function codes 05, 06, 15 and 16 are the only function codes supported for broadcast.
MODE	IN	USInt	Mode Selection: Specifies the type of request (read, write, or diagnostic). See the Modbus functions table below for details.
DATA_ADDR	IN	UDInt	Starting Address in the slave: Specifies the starting address of the data to be accessed in the Modbus slave. See the Modbus functions table below for valid addresses.
DATA_LEN	IN	UInt	Data Length: Specifies the number of bits or words to be accessed in this request. See the Modbus functions table below for valid lengths.
DATA_PTR	IN_OUT	Variant	Data Pointer: Points to the M or DB address (non-optimized DB type) for the data being written or read.
DONE	OUT	Bool	The DONE bit is TRUE for one scan, after the last request was completed with no error.
BUSY	OUT	Bool	• 0 – No Modbus_Master operation in progress • 1 – Modbus_Master operation in progress
ERROR	OUT	Bool	The ERROR bit is TRUE for one scan, after the last request was terminated with an error. The error code value at the STATUS parameter is valid only during the single scan where ERROR = TRUE.
STATUS	OUT	Word	Execution condition code

Modbus_Master communication rules

- Modbus_Comm_Load must be executed to configure a port before a Modbus_Master instruction can communicate with that port.
- If a port is to be used to initiate Modbus master requests, that port should not be used by a Modbus_Slave. One or more instances of Modbus_Master execution can be used with that port, but all Modbus_Master execution must use the same Modbus_Master instance DB for that port.
- The Modbus instructions do not use communication interrupt events to control the communication process. Your program must poll the Modbus_Master instruction for transmit and receive complete conditions.
- It is recommended that you call all Modbus_Master execution for a given port from a program cycle OB. Modbus_Master instructions may execute in only one of the program cycle or cyclic/time delay execution levels. They must not execute in both execution priority levels. Pre-emption of a Modbus_Master instruction by another Modbus_Master instruction in a higher priority execution priority level will result in improper operation. Modbus_Master instructions must not execute in the startup, diagnostic or time error execution priority levels.
- Once a Modbus_Master instruction initiates a transmission, this instance must be continually executed with the EN input enabled until a DONE=1 state or ERROR=1 state is returned. A particular Modbus_Master instance is considered active until one of these two events occurs. While the original instance is active, any call to any other instance with the REQ input enabled will result in an error. If the continuous execution of the original instance stops, the request state remains active for a period of time specified by the static variable "Blocked_Proc_Timeout". Once this period of time expires, the next Modbus_Master instruction called with an enabled REQ input will become the active instance. This prevents a single Modbus_Master instance from monopolizing or locking access to a port. If the original active instance is not enabled within the period of time specified by the static variable "Blocked_Proc_Timeout", then the next execution by this instance (with REQ not set) will clear the active state. If (REQ is set), then this execution initiates a new Modbus_Master request as if no other instance was active.

REQ parameter

0 = No request; 1 = Request to transmit data to Modbus Slave

You may control this input either through the use of a level or edge triggered contact. Whenever this input is enabled, a state machine is started to ensure that no other Modbus_Master using the same instance DB is allowed to issue a request, until the current request is completed. All other input states are captured and held internally for the current request, until the response is received or an error detected.

If the same instance of Modbus_Master is executed again with REQ input = 1 before the completion of the current request, then no subsequent transmissions are made. However, when the request is completed, a new request is issued whenever a Modbus_Master is executed again with REQ input = 1.

DATA_ADDR and MODE parameters select the Modbus function type

DATA_ADDR (starting Modbus address in the slave): Specifies the starting address of the data to be accessed in the Modbus slave.

The Modbus_Master instruction uses a MODE input rather than a Function Code input. The combination of MODE and Modbus address determine the Function Code that is used in the actual Modbus message. The following table shows the correspondence between parameter MODE, Modbus function code, and Modbus address range.

Table 13- 77 Modbus functions

MODE	Modbus function	Data length	Operation and data	Modbus address
0	01	1 to 2000 1 to 1992 [1]	Read output bits: 1 to (1992 or 2000) bits per request	1 to 9999
0	02	1 to 2000 1 to 1992 [1]	Read input bits: 1 to (1992 or 2000) bits per request	10001 to 19999
0	03	1 to 125 1 to 124 [1]	Read Holding registers: 1 to (124 or 125) words per request	40001 to 49999 or 400001 to 465535
0	04	1 to 125 1 to 124 [1]	Read input words: 1 to (124 or 125) words per request	30001 to 39999
104	04	1 to 125 1 to 124 1	Read input words: 1 to (124 or 125) words per request	00000 to 65535
1	05	1	Write one output bit: One bit per request	1 to 9999
1	06	1	Write one holding register: 1 word per request	40001 to 49999 or 400001 to 465535
1	15	2 to 1968 2 to 1960 [1]	Write multiple output bits: 2 to (1960 or 1968) bits per request	1 to 9999
1	16	2 to 123 2 to 122 [1]	Write multiple holding registers: 2 to (122 or 123) words per request	40001 to 49999 or 400001 to 465535
2	15	1 to 1968 2 to 1960 [1]	Write one or more output bits: 1 to (1960 or 1968) bits per request	1 to 9999
2	16	1 to 123 1 to 122 [1]	Write one or more holding registers: 1 to (122 or 123) words per request	40001 to 49999 or 400001 to 465535
11	11	0	Read the slave communication status word and event counter. The status word indicates busy (0 – not busy, 0xFFFF - busy). The event counter is incremented for each successful completion of a message. Both the DATA_ADDR and DATA_LEN operands of the Modbus_Master instruction are ignored for this function.	
80	08	1	Check slave status using data diagnostic code 0x0000 (Loopback test – slave echoes the request) 1 word per request	

MODE	Modbus function	Data length	Operation and data	Modbus address
81	08	1	Reset slave event counter using data diagnostic code 0x000A 1 word per request	
3 to 10, 12 to 79, 82 to 255			Reserved	

[1] For "Extended Addressing" mode the maximum data lengths are reduced by 1 byte or 1 word depending upon the data type used by the function.

DATA_PTR parameter

The DATA_PTR parameter points to the DB or M address that is written to or read from. If you use a data block, then you must create a global data block that provides data storage for reads and writes to Modbus slaves.

Note

The DATA_PTR data block type must allow direct addressing

The data block must allow both direct (absolute) and symbolic addressing. When you create the data block the "Standard" access attribute must be selected.

As of Modbus_Master instruction version V4.0 or later, you can enable the data block attribute "Optimized block access". You can only use a single element, or an array of elements, in optimized memory with the following data types: Bool, Byte, Char, Word, Int, DWord, Dint, Real, USInt, UInt, UDInt, SInt, or WChar.

Data block structures for the DATA_PTR parameter

- These data types are valid for **word reads** of Modbus addresses 30001 to 39999, 40001 to 49999, and 400001 to 465536 and also for **word writes** to Modbus addresses 40001 to 49999 and 400001 to 465536.
  - Standard array of WORD, UINT, or INT data types
  - Named WORD, UINT, or INT structure where each element has a unique name and 16 bit data type.
  - Named complex structure where each element has a unique name and a 16 or 32 bit data type.
- For **bit reads** and writes of Modbus addresses 00001 to 09999 and bit reads of 10001 to 19999.
  - Standard array of Boolean data types.
  - Named Boolean structure of uniquely named Boolean variables.

- Although not required, it is recommended that each Modbus_Master instruction have its own separate memory area. The reason for this recommendation is that there is a greater possibility of data corruption if multiple Modbus_Master instructions are reading and writing to the same memory area.
- There is no requirement that the DATA_PTR data areas be in the same global data block. You can create one data block with multiple areas for Modbus reads, one data block for Modbus writes, or one data block for each slave station.

Modbus_Master instruction data block (DB) variables

The following table shows the public static tags stored in the Modbus_Master instance DB that you can use in your program:

Table 13- 78 Modbus_Master instance DB static variables

Tag	Data type	Default	Description
Blocked_Proc_Timeout	Real	3.0	Duration (in seconds) for which to wait for a blocked Modbus_Master instance before this instance is removed as ACTIVE. This can occur, for example, if a Modbus_Master request is issued and the program then stops to call the Modbus_Master function before it has completely finished the request. The time value must be greater than 0 and less than 55 seconds, or an error occurs.
Extended_Addressing	Bool	FALSE	Configures single or double-byte slave station addressing: • FALSE = One-byte address; 0 to 247 • TRUE = Two-byte address (corresponds to extended addressing); 0 to 65535
MB_DB	MB_BASE	-	The MB_DB parameter of the Modbus_Comm_Load instruction must be connected to the MB_DB parameter of the Modbus_Master instruction.

Your program can write values to the Blocked_Proc_Timeout and Extended_Addressing variables to control the Modbus_Master operations. See the Modbus_Slave topic description of HR_Start_Offset (Page 1190) and Extended_Addressing (Page 1190) for an example of how to use these variables in the program editor and details about Modbus extended addressing.

Condition codes

Table 13- 79 Modbus_Master execution condition codes (communication and configuration errors) [1]

STATUS (W#16#)	Description
0000	No error
80C8	Slave timeout. The specified slave did not respond in the specified time. Please check the baud rate, parity, and wiring of the slave device. This error is only reported after any configured retries have been attempted.
80C9	The Modbus_Master instruction has timed out for one of the following reasons: • The instruction is waiting for a response from the module that is being used for communications. • The Blocked_Proc_Timeout value is set too small. This error is reported if a PROFIBUS or PROFINET distributed I/O device returns from one of the following: • An interruption to power or communication • A communication module pull/plug event In these instances, the hardware configuration from the PLC is reloaded, and Modbus_Comm_Load must be executed again to properly configure the communication module.
80D1	The receiver issued a flow control request to suspend an active transmission and never re-enabled the transmission during the specified wait time. This error is also generated during hardware flow control when the receiver does not assert CTS within the specified wait time.
80D2	The transmit request was aborted because no DSR signal is received from the DCE.
80E0	The message was terminated because the receive buffer is full.
80E1	The message was terminated as a result of a parity error.
80E2	The message was terminated as a result of a framing error.
80E3	The message was terminated as a result of an overrun error.
80E4	The message was terminated as a result of the specified length exceeding the total buffer size.
8180	Invalid port ID value or error with Modbus_Comm_Load instruction
8186	Invalid Modbus station address
8188	Invalid Mode specified for broadcast request
8189	Invalid Data Address value
818A	Invalid Data Length value
818B	Invalid pointer to the local data source/destination: Size not correct
818C	Invalid pointer for DATA_PTR or invalid Blocked_Proc_Timeout. The data area must be one of the following: • Classic DB • Array of elemental data types in a symbolic or retentive DB • M memory
8200	Port is busy processing a transmit request.

STATUS (W#16#)	Description
8280	Negative acknowledgement when reading module. Check the input at the PORT parameter. This can be caused by the loss of a PROFIBUS or PROFINET distributed I/O module, either by a station power or communication loss or a module pull.
8281	Negative acknowledgement when writing to module. Check the input at the PORT parameter. This can be caused by the loss of a PROFIBUS or PROFINET distributed I/O module, either by a station power or communication loss or a module pull.

Table 13- 80 Modbus_Master execution condition codes (Modbus protocol errors) [1]

STATUS (W#16#)	Response code from slave	Modbus protocol errors
8380	-	CRC error
8381	01	Function code not supported
8382	03	Data length error
8383	02	Data address error or address outside the valid range of the DATA_PTR area
8384	Greater than 03	Data value error
8385	03	Data diagnostic code value not supported (function code 08)
8386	-	Function code in the response does not match the code in the request.
8387	-	Wrong slave responded
8388	-	The slave response to a write request is incorrect. The write request returned by the slave does not match what the master actually sent.

[1] In addition to the Modbus_Master errors listed above, errors can be returned from the underlying PtP communication instructions.

Note

Setting the maximum record length for Profibus communication

When using a CM1243-5 Profibus Master module to control an ET 200SP or ET 200MP Profibus device that uses an RS232, RS422, or RS485 point-to-point module, you need to explicitly set the "max_record_len" data block tag to 240 as defined below:

Set "max_record_len" in the Send_P2P section of the instance DB (for example, "Modbus_Master_DB".Send_P2P.max_record_len) to 240 after running Modbus_Comm_Load.

Explicitly assigning max_record_len is only necessary with Profibus communication; Profinet communication already uses a valid max_record_len value.

Modbus_Slave (Communicate using SIPLUS I/O or the PtP port as Modbus RTU slave) instruction

Table 13- 81 Modbus_Slave instruction

LAD / FBD	SCL	Description

	`"Modbus_Slave_DB"(`
	`MB_ADDR:=_uint_in_,`
	`NDR=>_bool_out_,`
	`DR=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`MB_HOLD_REG:=_variant_inout_);`
		The Modbus_Slave instruction allows your program to communicate in one of two ways:
		• As a Modbus RTU slave through a PtP port on the CM (RS485 or RS232) and CB (RS485)
		• As a Modbus RTU slave through Modbus RTU SIPLUS I/O options:
		– Install ET 200MP S7-1500CM PtP (RS485 / 422 or RS232).
		– Install ET 200SP S7-1500 CM PtP (RS485 / 422 or RS232).
		When a remote Modbus RTU master issues a request, your user program responds to the request by Modbus_Slave execution. STEP 7 automatically creates an instance DB when you insert the instruction. Use this Modbus_Slave_DB name when you specify the MB_DB parameter for the Modbus_Comm_Load instruction.

Table 13- 82 Data types for the parameters

Parameter and type		Data type	Description
MB_ADDR	IN	V1.0: USInt V2.0: UInt	The station address of the Modbus slave: Standard addressing range (1 to 247) Extended addressing range (0 to 65535)
MB_HOLD_REG	IN_OUT	Variant	Pointer to the Modbus Holding Register DB: The Modbus holding register can be M memory or a data block.
NDR	OUT	Bool	New Data Ready: • 0 – No new data • 1 – Indicates that new data has been written by the Modbus master
DR	OUT	Bool	Data Read: • 0 – No data read • 1 – Indicates that data has been read by the Modbus master
ERROR	OUT	Bool	The ERROR bit is TRUE for one scan, after the last request was terminated with an error. If execution is terminated with an error, then the error code value at the STATUS parameter is valid only during the single scan where ERROR = TRUE.
STATUS	OUT	Word	Execution error code

Modbus communication function codes (1, 2, 4, 5, and 15) can read and write bits and words directly in the input process image and output process image of the CPU. For these function codes, the MB_HOLD_REG parameter must be defined as a data type larger than a byte. The following table shows the example mapping of Modbus addresses to the process image in the CPU.

Table 13- 83 Mapping of Modbus addresses to the process image

Modbus functions						S7-1200	
Codes	Function	Data area	Address range			Data area	CPU address
01	Read bits	Output	1	to	8192	Output Process Image	Q0.0 to Q1023.7
02	Read bits	Input	10001	to	18192	Input Process Image	I0.0 to I1023.7
04	Read words	Input	30001	to	30512	Input Process Image	IW0 to IW1022
05	Write bit	Output	1	to	8192	Output Process Image	Q0.0 to Q1023.7
15	Write bits	Output	1	to	8192	Output Process Image	Q0.0 to Q1023.7

Modbus communication function codes (3, 6, 16) use a Modbus holding register which can be an M memory address range or a data block. The type of holding register is specified by the MB_HOLD_REG parameter on the Modbus_Slave instruction.

Note

MB_HOLD_REG data block type

A Modbus holding register data block must allow both direct (absolute) and symbolic addressing. When you create the data block the "Standard" access attribute must be selected.

As of Modbus_Slave instruction version V4.0 or later, you can enable the data block attribute "Optimized block access". You can only use a single element, or an array of elements, in optimized memory with the following data types: Bool, Byte, Char, Word, Int, DWord, Dint, Real, USInt, UInt, UDInt, SInt, or WChar.

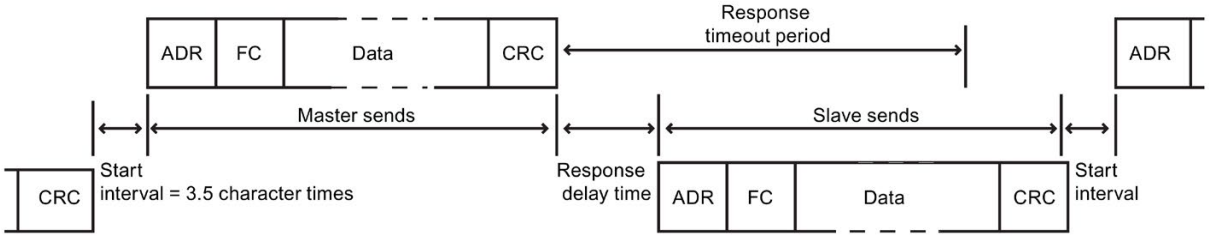
The following table shows examples of Modbus address to holding register mapping that is used for Modbus function codes 03 (read words), 06 (write word), and 16 (write words). The actual upper limit of DB addresses is determined by the maximum work memory limit and M memory limit, for each CPU model.

Table 13- 84 Mapping of Modbus addresses to CPU memory

Modbus master address	MB_HOLD_REG parameter examples				
	MW100	DB10.DBw0	MW120	DB10.DBW50	"Recipe".ingredient
40001	MW100	DB10.DBW0	MW120	DB10.DBW50	"Recipe".ingredient[1]
40002	MW102	DB10.DBW2	MW122	DB10.DBW52	"Recipe".ingredient[2]
40003	MW104	DB10.DBW4	MW124	DB10.DBW54	"Recipe".ingredient[3]
40004	MW106	DB10.DBW6	MW126	DB10.DBW56	"Recipe".ingredient[4]
40005	MW108	DB10.DBW8	MW128	DB10.DBW58	"Recipe".ingredient[5]

Table 13- 85 Diagnostic functions

S7-1200 Modbus_Slave Modbus diagnostic functions		
Codes	Sub-function	Description
08	0000H	Return query data echo test: • Prior to STEP 7 V15.1, the Modbus_Slave echos back to a Modbus master a word of data that is received. • As of STEP 7 V15.1 or later, the Modbus_Slave instruction V4.1 or later echos back one or more words of data that is received.
08	000AH	Clear communication event counter: The Modbus_Slave will clear out the communication event counter that is used for Modbus function 11.
11		Get communication event counter: The Modbus_Slave uses an internal communication event counter for recording the number of successful Modbus read and write requests that are sent to the Modbus_Slave. The counter does not increment on any Function 8, Function 11, or broadcast requests. It is also not incremented on any requests that result in a communication error (for example, parity or CRC errors).



The Modbus_Slave instruction supports broadcast write requests from any Modbus master as long as the request is for accessing valid addresses. Modbus_Slave will produce error code "0x8188" for function codes not supported in broadcast.

Modbus_Slave communication rules

- Modbus_Comm_Load must be executed to configure a port, before a Modbus_Slave instruction can communicate through that port.
- If a port is to respond as a slave to a Modbus_Master, then do not program that port with the Modbus_Master instruction.
- Only one instance of Modbus_Slave can be used with a given port, otherwise erratic behavior may occur.
- The Modbus instructions do not use communication interrupt events to control the communication process. Your program must control the communication process by polling the Modbus_Slave instruction for transmit and receive complete conditions.
- The Modbus_Slaveinstruction must execute periodically at a rate that allows it to make a timely response to incoming requests from a Modbus_Master. It is recommended that you execute Modbus_Slave every scan from a program cycle OB. Executing Modbus_Slave from a cyclic interrupt OB is possible, but is not recommended because of the potential for excessive time delays in the interrupt routine to temporarily block the execution of other interrupt routines.

Modbus signal timing

Modbus_Slave must be executed periodically to receive each request from the Modbus_Master and then respond as required. The frequency of execution for Modbus_Slave is dependent upon the response timeout period of the Modbus_Master. This is illustrated in the following diagram.

The response timeout period RESP_TO is the amount of time a Modbus_Master waits for the start of a response from a Modbus_Slave. This time period is not defined by the Modbus protocol, but is a parameter of each Modbus_Master. The frequency of execution (the time between one execution and the next execution) of Modbus_Slave must be based upon the particular parameters of your Modbus_Master. At a minimum, you should execute Modbus_Slave twice within the response timeout period of the Modbus_Master.

Modbus_Slave instruction data block (DB) variables

The following table shows the public static tags stored in the Modbus_Slave instance DB that you can use in your program:

Table 13- 86 Modbus_Slave instance DB static variables

Variable	Data type	Default	Description
HR_Start_Offset	Word	0	Assigns the starting address of the Modbus holding register (default = 0)
Extended_Addressing	Bool	FALSE	Configures single or double-byte slave addressing: • FALSE = single byte address • TRUE = double-byte address
Request_Count	Word	0	Total of all requests received by this slave
Slave_Message_Count	Word	0	Number of requests received for this specific slave
Bad_CRC_Count	Word	0	Number of requests received that have a CRC error
Broadcast_Count	Word	0	Number of broadcast requests received
Exception_Count	Word	0	Modbus-specific errors that require an acknowledgement with a returned exception to the master
Success_Count	Word	0	Number of requests received for this specific slave that have no protocol errors
MB_DB	MB_BASE	-	The MB_DB parameter of the Modbus_Comm_Load instruction must be connected to the MB_DB parameter of the Modbus_Slave instruction.
QB_Start	UInt	0	The starting address of the output bytes to which the CPU can write (QB0 to QB65535)
QB_Count	UInt	65535	The number of bytes to which a remote device can write. If QB_Count = 0, a remote device cannot write to the outputs. Example: To allow only QB10 through QB17 to be writable, QB_Start = 10 and QB_Count = 8.
QB_Read_Start	UInt	0	The starting address of the output bytes to which the CPU can read (QB0 to QB65535)
QB_Read_Count	UInt	65535	The number of output bytes from which a remote device can read. If QB_Count = 0, a remote device cannot read from the outputs. Example: To allow only QB10 through QB17 to be readable, QB_Start = 10 and QB_Count = 8.
IB_Read_Start	UInt	0	The starting address of the input bytes to which the CPU can read (IB0 to IB65535)
IB_Read_Count	UInt	65535	The number of input bytes from which a remote device can read. If IB_Count = 0, a remote device cannot read from the inputs. Example: To allow only IB10 through IB17 to be readable, IB_Start = 10 and IB_Count = 8.

Your program can write values to the HR_Start_Offset and Extended_Addressing tags and control the Modbus slave operations. You can read the other tags to monitor the Modbus status.

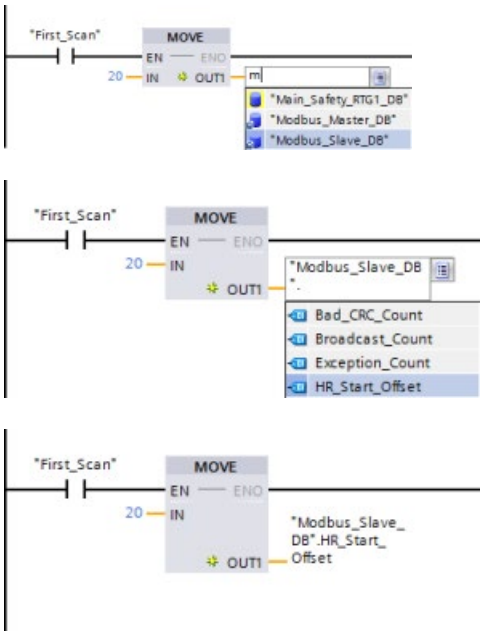
Version requirements for Modbus_Slave instruction data block (DB) variables availability are as follows:

Table 13- 87 Modbus_Slave instruction data block (DB) variables availability version requirements: Instruction, TIA Portal, and S7-1200 CPU

Modbus_Slave instruction version	TIA Portal version	S7-1200 CPU firmware (FW) version	Data block variables
3.0	V14 SP1	CPU FW V4.0 or later	QB_Start
			QB_Count
4.0	V15.1	CPU FW V4.2 or later	QB_Start
			QB_Count
			QB_Read_Start
			QB_Read_Count
			IB_Read_Start
			IB_Read_Count

HR_Start_Offset

Modbus holding register addresses begin at 40001 or 400001. These addresses correspond to the beginning PLC memory address of the holding register. However, you can configure the "HR_Start_Offset" variable to start the beginning Modbus holding register address at another value instead of 40001 or 400001.



For example, if the holding register is configured to start at MW100 and is 100 words long. An offset of 20 specifies a beginning holding register address of 40021 instead of 40001. Any address below 40021 and above 400119 will result in an addressing error.

Table 13- 88 Example of Modbus holding register addressing

HR_Start_Offset	Address	Minimum	Maximum
0	Modbus address (Word)	40001	40099
	S7-1200 address	MW100	MW298
20	Modbus address (Word)	40021	40119
	S7-1200 address	MW100	MW298

HR_Start_Offset is a word value that specifies the starting address of the Modbus holding register and is stored in the Modbus_Slave instance data block. You can set this public static variable value by using the parameter helper drop-list, after Modbus_Slave is placed in your program.

For example, after Modbus_Slave is placed in a LAD network, you can go to a previous network and assign the HR_Start_Offset value. The value must be assigned prior to execution of Modbus_Slave.

Entering a Modbus slave variable using the default DB name:

1. Set the cursor in the parameter field and type an m character.
2. Select "Modbus_Slave_DB" from the drop-list.
3. Set the cursor at the right side of the DB name (after the quote character) and enter a period character.
4. Select "Modbus_Slave_DB.HR_Start_Offset" from the drop list.

Extended_Addressing

The Extended_Addressing variable is accessed in a similar way as the HR_Start_Offset reference discussed above except that the Extended_Addressing variable is a Boolean value. The Boolean value must be written by an output coil and not a move box.

Modbus slave addressing can be configured to be either a single byte (which is the Modbus standard) or double byte. Extended addressing is used to address more than 247 devices within a single network. Selecting extended addressing allows you to address a maximum of 64000 addresses. A Modbus function 1 frame is shown below as an example.

Table 13- 89 Single-byte slave address (byte 0)

Function 1	Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	
Request	Slave addr.	F code	Start address		Length of coils		
Valid Response	Slave addr.	F code	Length	Coil data			
Error response	Slave addr.	0x81	E code				

Table 13- 90 Double-byte slave address (byte 0 and byte 1)

	Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6
Request	Slave address		F code	Start address		Length of coils	
Valid Response	Slave address		F code	Length	Coil data		
Error response	Slave address		0x81	E code			

Access to data areas in data blocks (DB) instead of direct access to Modbus addresses

As of version V4.0 of the Modbus_Slave instruction and firmware (FW) version V4.2 of the S7-1200 CPU, you can access data areas in DBs instead of directly accessing process images and holding registers. In order to do this, in the global DB "Attributes" Property page, you must deselect the "Only store in load memory" and "Optimized block access" check boxes.

If a Modbus request arrives and you did not define a data area for the Modbus data type of the corresponding function code, the CPU treats the request as in previous instruction versions: You access process images and holding registers directly.

If you have defined a data area for the Modbus data type of the function code, the Modbus_Slave instruction reads from or writes to that data area. Whether it reads or writes depends on the job type.

For one individual Modbus request, you can only read from or write to one data area. If, for example, you want to read holding registers that extend over multiple data areas, you require multiple Modbus requests.

These are the rules for defining data areas:

- You can define up to eight data areas in different DBs; each DB must only contain one data area. An individual MODBUS request can only read from precisely one data area or write to precisely one data area. Each data area corresponds to one MODBUS address area. You define the data areas in the "Data_Area_Array" static tag of the instance DB.
- If you want to use less than eight data areas, you must place the required data areas one behind the other, without any gaps. The first blank entry in the data areas ends the data area search during processing. If, for example, you define the field elements 1, 2, 4, and 5, the "Data_Area_Array" only recognizes field elements 1 and 2. as field element 3 is empty.
- The Data_Area_Array field consists of eight elements: Data_Area_Array[1] to Data_Area_Array[8]
- Each field element Data_Area_Array[x], 1 <= x <= 8, is a UDT of the type MB_DataArea and is structured as follows:

Parameter	Data type	Meaning
data_ type	UInt	Identifier for the MODBUS data type that is mapped to this data area: • 0: Identifier for an empty field element or an unused data area. In this case, the values of db, start and length are irrelevant. • 1: Process image output (used with function codes 1, 5, and 15) • 2: Process image input (used with function code 2) • 3: Holding register (used with function codes 3, 6, and 16) • 4: Input register (used with function code 4) Note: If you have defined a data area for a MODBUS data type, the instruction Modbus_Slave can no longer access this MODBUS data type directly. If the address of a MODBUS request for such a data type does not correspond to a defined data area, a value of W#16#8383 is returned in STATUS.
db	UInt	Number of the data block to which the MODBUS register or bits subsequently defined are mapped The DB number must be unique in the data areas. The same DB number must not be defined in multiple data areas. Inthe global DB "Attributes" Property page, you must deselect the "Only store in load memory" and "Optimized block access" check boxes. Data areas also start with the byte address 0 of the DB. Permitted values: 1 to 60999
start	UInt	First MODBUS address that is mapped to the data block starting from address 0.0 Permitted values: 0 to 65535
length	UInt	Number of bits (for the values 1 and 2 of data_type) or number of registers (for the values 3 and 4 of data_type) The MODBUS address areas of one and the same MODBUS data type must not overlap. Permitted values: 1 to 65535

- First example: data_type = 3, db = 1, start = 10, length = 6

  The CPU maps the holding registers (data_type = 3) in data block 1 (db = 1), placing the Modbus address 10 (start = 10) at data word 0 and the last valid Modbus address 15 (length = 6) at data word 5.

- Second example: data_type = 2, db = 15, start = 1700, length = 112

  The CPU maps the inputs (data_type = 2) in data block 15 (db = 15), placing the Modbus address 1700 (start = 1700) at data word 0 and the last valid Modbus address 1811 (length = 112) at data word 111.

Condition codes

Table 13- 91 Modbus_Slave execution condition codes (communication and configuration errors) [1]

STATUS (W#16#)	Description
80D1	The receiver issued a flow control request to suspend an active transmission and never re-enabled the transmission during the specified wait time. This error is also generated during hardware flow control when the receiver does not assert CTS within the specified wait time.
80D2	The transmit request was aborted because no DSR signal is received from the DCE.
80E0	The message was terminated because the receive buffer is full.
80E1	The message was terminated as a result of a parity error.
80E2	The message was terminated as a result of a framing error.
80E3	The message was terminated as a result of an overrun error.
80E4	The message was terminated as a result of the specified length exceeding the total buffer size.
8180	Invalid port ID value or error with Modbus_Comm_Load instruction
8186	Invalid Modbus station address
8187	Invalid pointer to MB_HOLD_REG DB: Area is too small
818C	Invalid MB_HOLD_REG pointer. The data area must be one of the following: • Classic DB • Array of elemental data types in a symbolic or retentive DB • M memory

Table 13- 92 Modbus_Slave execution condition codes (Modbus protocol errors) [1]

STATUS (W#16#)	Response code from slave	Modbus protocol errors
8380	No response	CRC error
8381	01	Function code not supported or not supported within broadcasts
8382	03	Data length error
8383	02	Data address error or address outside the valid range of the DATA_PTR area
8384	03	Data value error
8385	03	Data diagnostic code value not supported (function code 08)

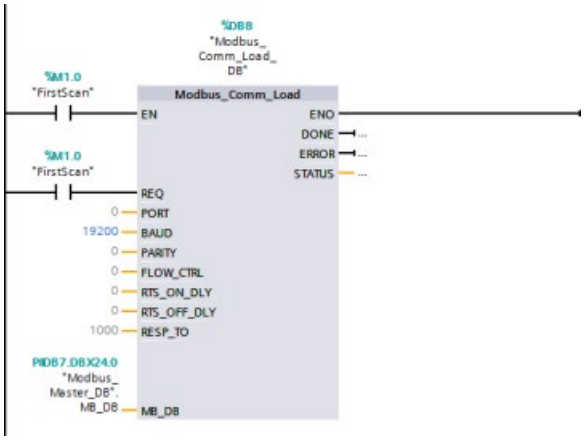
[1] In addition to the Modbus_Slave errors listed above, errors can be returned from the underlying PtP communication instructions.

Note

Setting the maximum record length for PROFIBUS communication

When using a CM1243-5 PROFIBUS Master module to control an ET 200SP or ET 200MP PROFIBUS device that uses an RS232, RS422, or RS485 point-to-point module, you need to explicitly set the "max_record_len" data block tag to 240 as defined below:

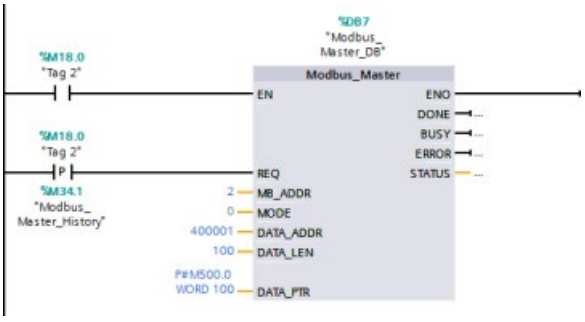
Set "max_record_len" in the Send_P2P section of the instance DB (for example, "Modbus_Slave_DB".Send_P2P.max_record_len) to 240 after running Modbus_Comm_Load.



Explicitly assigning max_record_len is only necessary with PROFIBUS communication; PROFINET communication already uses a valid max_record_len value.

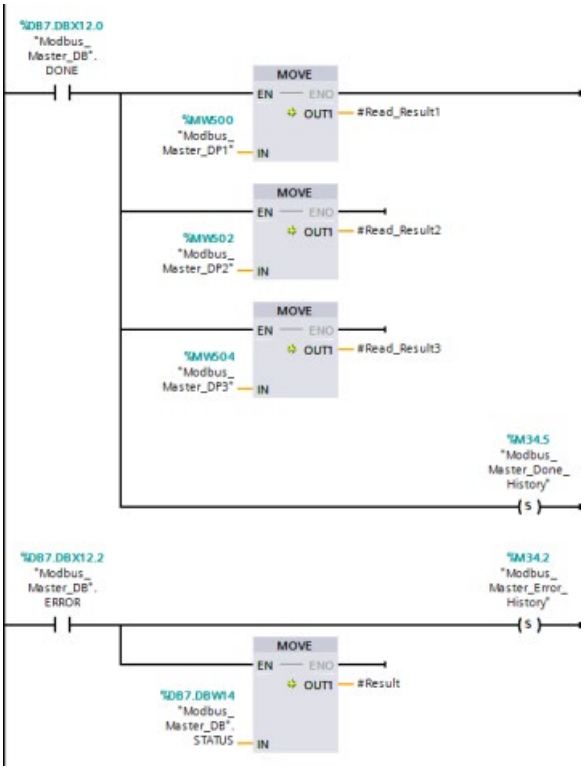
13.5.3.5 Modbus RTU examples

Example: Modbus RTU master program

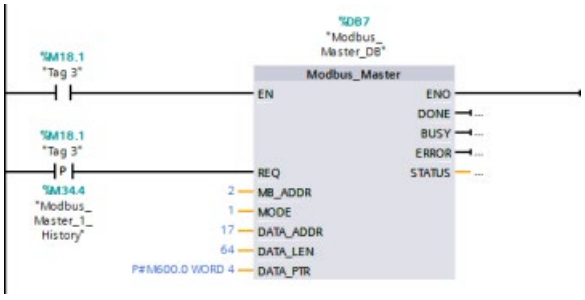


Modbus_Comm_Load is initialized during start-up by using the first scan flag. Execution of Modbus_Comm_Load in this manner should only be done when the serial port configuration will not change at runtime.

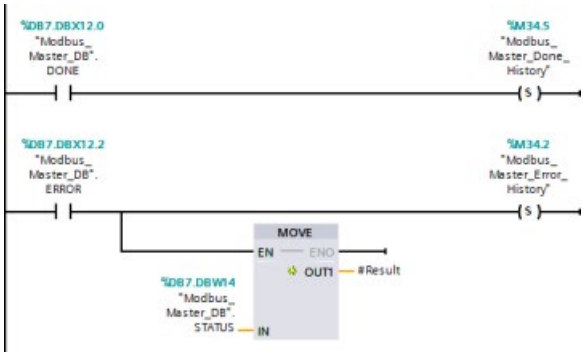
Network 1: Configure/initialize the RS485 module communications port only once during the first scan.



One Modbus_Master instruction is used in the program cycle OB to communicate with a single slave. Additional Modbus_Master instructions can be used in the program cycle OB to communicate with other slaves, or one Modbus_Master FB could be re-used to communicate with additional slaves.



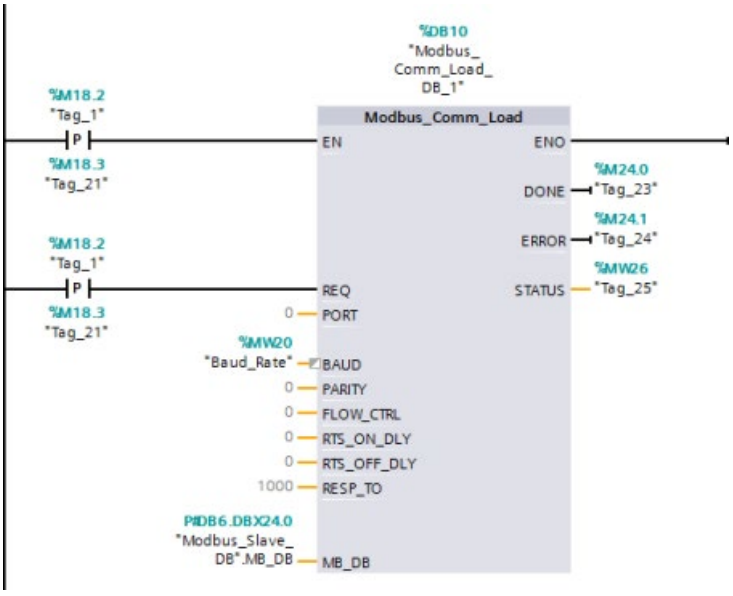
Network 2: Read 100 words of holding register data from location 400001 on slave #2 to memory location MW500-MW698.



Network 3: Move the first 3 words of the holding register data that has been read to some other location, and set a DONE history bit. This network also sets an ERROR history bit and saves the STATUS word to another location in the event of an error.

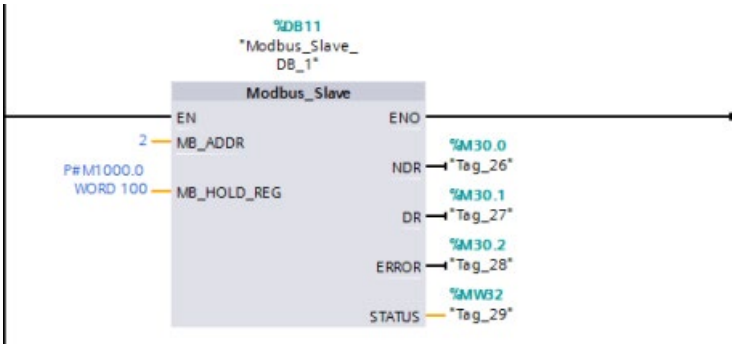
Network 4: Write 64 bits of data from MW600-MW607 to output bit locations 00017 to 00081 on slave #2.

Network 5: Set a DONE history bit when the write is complete. If an error occurs, the program sets an ERROR history bit and saves the STATUS code.



Example: Modbus RTU slave program

MB_COMM_LOAD shown below is initialized each time "Tag_1" is enabled.



Execution of MB_COMM_LOAD in this manner should only be done when the serial port configuration will change at runtime, as a result of HMI configuration.

Network 1: Initialize the RS485 module parameters each time they are changed by an HMI device.

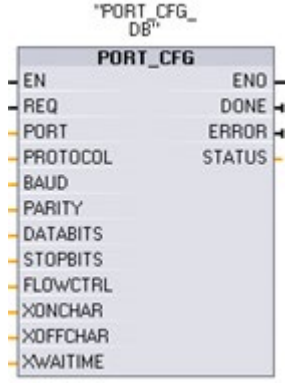
MB_SLAVE shown below is placed in a cyclic OB that is executed every 10 ms. While this does not give the absolute fastest response by the slave, it does provide good performance at 9600 baud for short messages (20 bytes or less in the request).

Network 2: Check for Modbus master requests during each scan. The Modbus holding register is configured for 100 words starting at MW1000.

13.6 Legacy PtP communication (CM/CB 1241 only)

Prior to the release of STEP 7 V13 SP1 and the S7-1200 V4.1 CPUs, the point-to-point communication instructions existed with different names, and in some cases, slightly different interfaces. The general concepts about point-to-point communication (Page 1070), as well as port (Page 1073) and parameter configuration (Page 1088) apply to both sets of instructions. Refer to the individual legacy point-to-point instructions for programming information.

Table 13- 93 Common error classes



Class description	Error classes	Description
Port configuration	80Ax	Used to define common port configuration errors
Transmit configuration	80Bx	Used to define common transmit configuration errors
Receive configuration	80Cx	Used to define common receive configuration errors
Transmission runtime	80Dx	Used to define common transmission runtime errors
Reception runtime	80Ex	Used to define common reception runtime errors
Signal handling	80Fx	Used to define common errors associated with all signal handling

13.6.1 Legacy point-to-point instructions

13.6.1.1 PORT_CFG (Configure communication parameters dynamically)

Table 13- 94 PORT_CFG (Port Configuration) instruction

LAD / FBD	SCL	Description

	`"PORT_CFG_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_uint_in_,`
	`PROTOCOL:=_uint_in_,`
	`BAUD:=_uint_in_,`
	`PARITY:=_uint_in_,`
	`DATABITS:=_uint_in_,`
	`STOPBITS:=_uint_in_,`
	`FLOWCTRL:=_uint_in_,`
	`XONCHAR:=_char_in_,`
	`XOFFCHAR:=_char_in_,`
	`WAITTIME:=_uint_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_);`
		PORT_CFG allows you to change port parameters such as baud rate from your program.
		You can set up the initial static configuration of the port in the device configuration properties, or just use the default values. You can execute the PORT_CFG instruction in your program to change the configuration.

[1] STEP 7 automatically creates the DB when you insert the instruction.

The PORT_CFG configuration changes are not permanently stored in the CPU. The parameters configured in the device configuration are restored when the CPU transitions from RUN to STOP mode and after a power cycle. See Configuring the communication ports (Page 1073) and Managing flow control (Page 1075) for more information.

Table 13- 95 Data types for the parameters

Parameter and type		Data type	Description
REQ	IN	Bool	Activate the configuration change on rising edge of this input. (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
PROTOCOL	IN	UInt	0 - Point-to-Point communication protocol (Default value) 1..n - future definition for specific protocols
BAUD	IN	UInt	Port baud rate (Default value: 6): 1 = 300 baud, 2 = 600 baud, 3 = 1200 baud, 4 = 2400 baud, 5 = 4800 baud, 6 = 9600 baud, 7 = 19200 baud, 8 = 38400 baud, 9 = 57600 baud, 10 = 76800 baud, 11 = 115200 baud
PARITY	IN	UInt	Port parity (Default value: 1): 1 = No parity, 2 = Even parity, 3 = Odd parity, 4 = Mark parity, 5 = Space parity
DATABITS	IN	UInt	Bits per character (Default value:1): 1 = 8 data bits, 2 = 7 data bits
STOPBITS	IN	UInt	Stop bits (Default value: 1): 1 = 1 stop bit, 2 = 2 stop bits
FLOWCTRL	IN	UInt	Flow control (Default value: 1): 1 = No flow control, 2 = XON/XOFF, 3 = Hardware RTS always ON, 4 = Hardware RTS switched
XONCHAR	IN	Char	Specifies the character that is used as the XON character. This is typically a DC1 character (16#11). This parameter is only evaluated if flow control is enabled. (Default value: 16#11)
XOFFCHAR	IN	Char	Specifies the character that is used as the XOFF character. This is typically a DC3 character (116#3). This parameter is only evaluated if flow control is enabled. (Default value: 16#13)
XWAITIME	IN	UInt	Specifies how long to wait for a XON character after receiving a XOFF character, or how long to wait for the CTS signal after enabling RTS (0 to 65535 ms). This parameter is only evaluated if flow control is enabled. (Default value: 2000)
DONE	OUT	Bool	TRUE for one execution after the last request was completed with no error
ERROR	OUT	Bool	TRUE for one execution after the last request was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)

Table 13- 96 Condition codes

STATUS (W#16#....)	Description
80A0	Specific protocol does not exist.
80A1	Specific baud rate does not exist.
80A2	Specific parity option does not exist.
80A3	Specific number of data bits does not exist.
80A4	Specific number of stop bits does not exist.
80A5	Specific type of flow control does not exist.
80A6	Wait time is 0 and flow control enabled
80A7	XON and XOFF are illegal values (for example, the same value)

13.6.1.2 SEND_CFG (Configure serial transmission parameters dynamically)

Table 13- 97 SEND_CFG (Send Configuration) instruction

LAD / FBD	SCL	Description

	`"SEND_CFG_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_uint_in_,`
	`RTSONDLY:=_uint_in_,`
	`RTSOFFDLY:=_uint_in_,`
	`BREAK:=_uint_in_,`
	`IDLELINE:=_uint_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_);`
		SEND_CFG allows the dynamic configuration of serial transmission parameters for a PtP communication port. Any queued messages within a CM or CB are discarded when SEND_CFG is executed.

[1] STEP 7 automatically creates the DB when you insert the instruction.

You can set up the initial static configuration of the port in the device configuration properties, or just use the default values. You can execute the SEND_CFG instruction in your program to change the configuration.

The SEND_CFG configuration changes are not permanently stored in the CPU. The parameters configured in the device configuration are restored when the CPU transitions from RUN to STOP mode and after a power cycle. See Configuring transmit (send) parameters.

Table 13- 98 Data types for the parameters

Parameter and type		Data type	Description
REQ	IN	Bool	Activate the configuration change on the rising edge of this input.. (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
RTSONDLY	IN	UInt	Number of milliseconds to wait after enabling RTS before any Tx data transmission occurs. This parameter is only valid when hardware flow control is enabled. The valid range is 0 - 65535 ms. A value of 0 disables the feature. (Default value: 0)
RTSOFFDLY	IN	UInt	Number of milliseconds to wait after the Tx data transmission occurs before RTS is disabled: This parameter is only valid when hardware flow control is enabled. The valid range is 0 - 65535 ms. A value of 0 disables the feature. (Default value: 0)
BREAK	IN	UInt	This parameter specifies that a break will be sent upon the start of each message for the specified number of bit times. The maximum is 65535 bit times up to an eight second maximum. A value of 0 disables the feature. (Default value: 12)
IDLELINE	IN	UInt	This parameter specifies that the line will remain idle for the specified number of bit times before the start of each message. The maximum is 65535 bit times up to an eight second maximum. A value of 0 disables the feature. (Default value: 12)
DONE	OUT	Bool	TRUE for one execution after the last request was completed with no error
ERROR	OUT	Bool	TRUE for one execution after the last request was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)

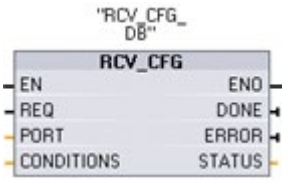


Table 13- 99 Condition codes

STATUS (W#16#....)	Description
80B0	Transmit interrupt configuration is not allowed.
80B1	Break time is greater than the maximum allowed value.
80B2	Idle time is greater than the maximum allowed value.

13.6.1.3 RCV_CFG (Configure serial receive parameters dynamically)

Table 13- 100 RCV_CFG (Receive Configuration) instruction

LAD / FBD	SCL	Description

	`"RCV_CFG_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_uint_in_,`
	`CONDITIONS:=_struct_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_);`
		RCV_CFG performs dynamic configuration of serial receiver parameters for a PtP communication port. This instruction configures the conditions that signal the start and end of a received message. Any queued messages within a CM or CB are discarded when RCV_CFG is executed.

[1] STEP 7 automatically creates the DB when you insert the instruction.

You can set up the initial static configuration of the communication port in the device configuration properties, or just use the default values. You can execute the RCV_CFG instruction in your program to change the configuration.

The RCV_CFG configuration changes are not permanently stored in the CPU. The parameters configured in the device configuration are restored when the CPU transitions from RUN to STOP mode and after a power cycle. See Configuring receive parameters (Page 1077) for more information.

Table 13- 101 Data types for the parameters

Parameter and type		Data type	Description
REQ	IN	Bool	Activate the configuration change on the rising edge of this input. (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
CONDITIONS	IN	CONDITIONS	The Conditions data structure specifies the starting and ending message conditions as described below.
DONE	OUT	Bool	TRUE for one scan, after the last request was completed with no error
ERROR	OUT	Bool	TRUE for one scan, after the last request was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)

Start conditions for the RCV_PTP instruction

The RCV_PTP instruction uses the configuration specified by the RCV_CFG instruction to determine the beginning and ending of point-to-point communication messages. The start of a message is determined by the start conditions. The start of a message can be determined by one or a combination of start conditions. If more than one start condition is specified, all the conditions must be satisfied before the message is started.

See the topic "Configuring receive parameters (Page 1077)" for a description of the message start conditions.

Parameter CONDITIONS data type structure part 1 (start conditions)

Table 13- 102 CONDITIONS structure for START conditions

Parameter and type		Data type	Description
STARTCOND	IN	UInt	Specifies the start condition (Default value: 1) • 01H - Start Char • 02H - Any Char • 04H - Line Break • 08H - Idle Line • 10H - Sequence 1 • 20H - Sequence 2 • 40H - Sequence 3 • 80H - Sequence 4
IDLETIME	IN	UInt	The number of bit times required for idle line timeout. (Default value: 40). Only used with an idle line condition. 0 to 65535
STARTCHAR	IN	Byte	The start character used with the start character condition. (Default value: B#16#2)
SEQ[1].CTL	IN	Byte	Sequence 1 ignore/compare control for each character: (Default value: B#16#0) These are the enabling bits for each character in start sequence • 01H - Character 1 • 02H - Character 2 • 04H - Character 3 • 08H - Character 4 • 10H - Character 5 Disabling the bit associated with a character means any character will match, in this sequence position.
SEQ[1].STR	IN	Char[5]	Sequence 1 start characters (5 characters). Default value: 0
SEQ[2].CTL	IN	Byte	Sequence 2 ignore/compare control for each character. Default value: B#16#0)
SEQ[2].STR	IN	Char[5]	Sequence 2 start characters (5 characters). Default value: 0
SEQ[3].CTL	IN	Byte	Sequence 3 ignore/compare control for each character. Default value: B#16#0
SEQ[3].STR	IN	Char[5]	Sequence 3 start characters (5 characters). Default value: 0

Parameter and type		Data type	Description
SEQ[4].CTL	IN	Byte	Sequence 4 ignore/compare control for each character. Default value: B#16#0
SEQ[4].STR	IN	Char[5]	Sequence 4 start characters (5 characters), Default value: 0

Example

Consider the following received hexadecimal coded message: "**68** 10 aa **68** bb 10 aa 16" and the configured start sequences shown in the table below. Start sequences begin to be evaluated when the first 68H character is successfully received. Upon successfully receiving the fourth character (the second 68H), then start condition 1 is satisfied. Once the start conditions are satisfied, the evaluation of the end conditions begins.

The start sequence processing can be terminated due to various parity, framing, or inter-character timing errors. These errors result in no received message, because the start condition was not satisfied.

Table 13- 103 Start conditions

Start condition	First Character	First Character +1	First Character +2	First Character +3	First Character +4
1	**68**H	xx	xx	**68**H	xx
2	10H	aaH	xx	xx	xx
3	dcH	aaH	xx	xx	xx
4	e5H	xx	xx	xx	xx

End conditions for the RCV_PTP instruction

The end of a message is determined by the specification of end conditions. The end of a message is determined by the first occurrence of one or more configured end conditions. The section "Message end conditions" in the topic "Configuring receive parameters (Page 1077)" describes the end conditions that you can configure in the RCV_CFG instruction.

You can configure the end conditions in either the properties of the communication interface in the device configuration, or from the RCV_CFG instruction. Whenever the CPU transitions from STOP to RUN, the receive parameters (both start and end conditions) return to the device configuration settings. If the STEP 7 user program executes RCV_CFG, then the settings are changed to the RCV_CFG conditions.

Parameter CONDITIONS data type structure part 2 (end conditions)

Table 13- 104 CONDITIONS structure for END conditions

Parameter	Parameter type	Data type	Description
ENDCOND	IN	UInt 0	This parameter specifies message end condition: • 01H - Response time • 02H - Message time • 04H - Inter-character gap • 08H - Maximum length • 10H - N + LEN + M • 20H - Sequence
MAXLEN	IN	UInt 1	Maximum message length: Only used when the maximum length end condition is selected. 1 to 1024 bytes
N	IN	UInt 0	Byte position within the message of the length field. Only used with the N + LEN + M end condition. 1 to 1022 bytes
LENGTHSIZE	IN	UInt 0	Size of the length field (1, 2, or 4 bytes). Only used with the N + LEN + M end condition.
LENGTHM	IN	UInt 0	Specify the number of characters following the length field that are not included in the value of the length field. This is only used with the N + LEN + M end condition. 0 to 255 bytes
RCVTIME	IN	UInt 200	Specify how long to wait for the first character to be received. The receive operation will be terminated with an error if a character is not successfully received within the specified time. This is only used with the response time condition. (0 to 65535 bit times with an 8 second maximum) This parameter is not a message end condition since evaluation terminates when the first character of a response is received. It is an end condition only in the sense that it terminates a receiver operation because no response is received when a response is expected. You must select a separate end condition.
MSGTIME	IN	UInt 200	Specify how long to wait for the entire message to be completely received once the first character has been received. This parameter is only used when the message timeout condition is selected. (0 to 65535 milliseconds)
CHARGAP	IN	UInt 12	Specify the number of bit times between characters. If the number of bit times between characters exceeds the specified value, then the end condition will be satisfied. This is only used with the inter-character gap condition. (0 to 65535 bit times up to 8 second maximum)

Parameter	Parameter type	Data type	Description
SEQ.CTL	IN	Byte B#16#0	Sequence 1 ignore/compare control for each character: These are the enabling bits for each character for the end sequence. Character 1 is bit 0, character 2 is bit 1, …, character 5 is bit 4. Disabling the bit associated with a character means any character will match, in this sequence position.
SEQ.STR	IN	Char[5] 0	Sequence 1 start characters (5 characters)

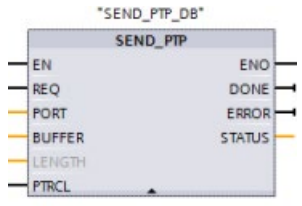

Table 13- 105 Condition codes

STATUS (W#16#....)	Description
80C0	Illegal start condition selected
80C1	Illegal end condition selected, no end condition selected
80C2	Receive interrupt enabled and this is not possible.
80C3	Maximum length end condition is enabled and max length is 0 or > 1024.
80C4	Calculated length is enabled and N is >= 1023.
80C5	Calculated length is enabled and length is not 1, 2 or 4.
80C6	Calculated length is enabled and M value is > 255.
80C7	Calculated length is enabled and calculated length is > 1024.
80C8	Response timeout is enabled and response timeout is zero.
80C9	Inter-character gap timeout is enabled and it is zero.
80CA	Idle line timeout is enabled and it is zero.
80CB	End sequence is enabled but all chars are "don't care".
80CC	Start sequence (any one of 4) is enabled but all characters are "don't care".

13.6.1.4 SEND_PTP (Transmit send buffer data)

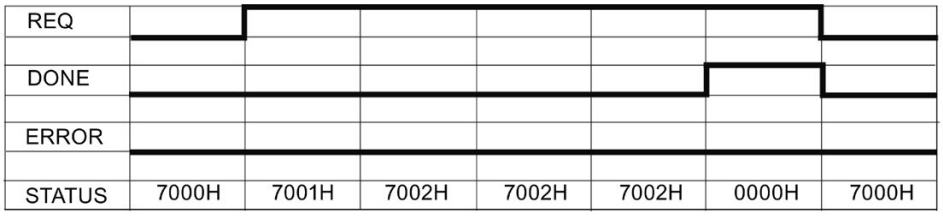
Table 13- 106 SEND_PTP (Send Point-to-Point data) instruction

LAD / FBD	SCL	Description

	`"SEND_PTP_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_uint_in_,`
	
	`BUFFER:=_variant_in_,`
	`LENGTH:=_uint_in_,`
	`PTRCL:=_bool_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_);`
		SEND_PTP initiates the transmission of the data and transfers the assigned buffer to the communication interface. The CPU program continues while the CM or CB sends the data at the assigned baud rate. Only one send operation can be pending at a given time. The CM or CB returns an error if a second SEND_PTP is executed while the CM or CB is already transmitting a message.

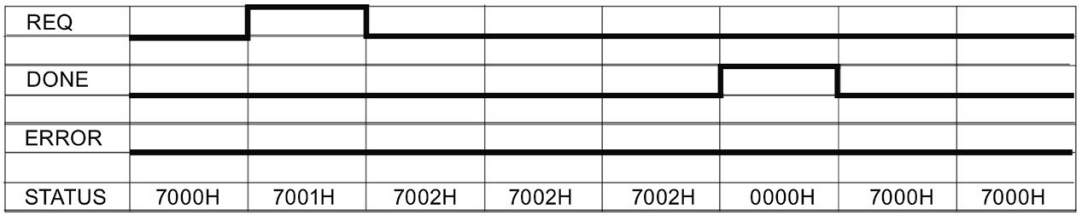
[1] STEP 7 automatically creates the DB when you insert the instruction.

Table 13- 107 Data types for the parameters



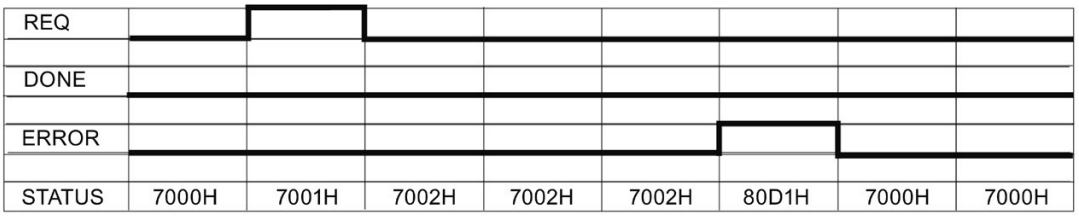
Parameter and type		Data type	Description
REQ	IN	Bool	Activates the requested transmission on the rising edge of this transmission enable input. This initiates transfer of the contents of the buffer to the Point-to-Point communication interface. (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
BUFFER	IN	Variant	This parameter points to the starting location of the transmit buffer. (Default value: 0) **Note:** Boolean data or Boolean arrays are not supported.
LENGTH [1]	IN	UInt	Transmitted frame length in bytes (Default value: 0) When transmitting a complex structure, always use a length of 0.
PTRCL	IN	Bool	Reserved for future use
DONE	OUT	Bool	TRUE for one scan, after the last request was completed with no error
ERROR	OUT	Bool	TRUE for one scan, after the last request was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)

[1] Optional parameter: Click the arrow at the bottom of a LAD/FBD box to expand the box and include this parameter.



While a transmit operation is in progress, the DONE and ERROR outputs are FALSE. When a transmit operation is complete, either the DONE or the ERROR output will be set TRUE to show the status of the transmit operation. While DONE or ERROR is TRUE, the STATUS output is valid.

The instruction returns a status of 16#7001 if the communication interface accepts the transmit data. Subsequent SEND_PTP executions return 16#7002, if the CM or CB is still busy transmitting. When the transmit operation is complete, the CM or CB returns the status of the transmit operation as 16#0000 (if no errors occurred). Subsequent executions of SEND_PTP with REQ low return a status of 16#7000 (not busy).



The following diagrams show the relationship of the output values to REQ. This assumes that the instruction is called periodically to check for the status of the transmission process. In the diagram below, it is assumed that the instruction is called every scan (represented by the STATUS values).

The following diagram shows how the DONE and STATUS parameters are valid for only one scan if the REQ line is pulsed (for one scan) to initiate the transmit operation.

The following diagram shows the relationship of DONE, ERROR and STATUS parameters when there is an error.

The DONE, ERROR and STATUS values are only valid until SEND_PTP executes again with the same instance DB.

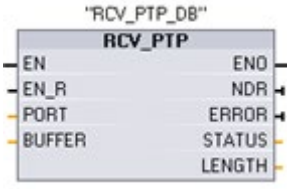


Table 13- 108 Condition codes

STATUS (W#16#....)	Description
80D0	New request while transmitter active
80D1	Transmit aborted because of no CTS within wait time
80D2	Transmit aborted because of no DSR from the DCE device
80D3	Transmit aborted because of queue overflow (transmit more than 1024 bytes)
80D5	Reverse bias signal (wire break condition)
833A	The DB for the BUFFER parameter does not exist.

13.6.1.5 RCV_PTP (Enable receive messages)

Table 13- 109 RCV_PTP (Receive Point-to-Point) instruction

LAD / FBD	SCL	Description

	`"RCV_PTP_DB"(`
	`EN_R:=_bool_in_,`
	`PORT:=_uint_in_,`
	`BUFFER:=_variant_in_,`
	`NDR=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`LENGTH=>_uint_out_);`
		RCV_PTP checks for messages that have been received in the CM or CB. If a message is available, it will be transferred from the CM or CB to the CPU. An error returns the appropriate STATUS value.

[1] STEP 7 automatically creates the DB when you insert the instruction.

Table 13- 110 Data types for the parameters

Parameter and type		Data type	Description
EN_R	IN	Bool	When this input is TRUE and a message is available, the message is transferred from the CM or CB to the BUFFER. When EN_R is FALSE, the CM or CB is checked for messages and NDR, ERROR and STATUS output are updated, but the message is not transferred to the BUFFER. (Default value: 0)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
BUFFER	IN	Variant	This parameter points to the starting location of the receive buffer. This buffer should be large enough to receive the maximum length message. Boolean data or Boolean arrays are not supported. (Default value: 0)
NDR	OUT	Bool	TRUE for one execution when new data is ready and operation is complete with no errors.
ERROR	OUT	Bool	TRUE for one execution after the operation was completed with an error.
STATUS	OUT	Word	Execution condition code (Default value: 0)
LENGTH	OUT	UInt	Length of the returned message in bytes (Default value: 0)

Note the following correlation between the EN_R input and the message buffer of the RCV_PTP instruction:

Input EN_R controls the copy of a received message to the BUFFER.

When the EN_R input is TRUE and a message is available, the CPU transfers the message from the CM or CB to the BUFFER and updates the NDR, ERROR, STATUS, and LENGTH outputs.

When EN_R is FALSE, the CPU checks the CM or CB for messages and updates the NDR, ERROR, and STATUS outputs, but does not transfer the message to the BUFFER. (Note that the default value of EN_R is FALSE.)

The recommended practice is to set EN_R to TRUE and control execution of the RCV_PTP instruction with the EN input.

The STATUS value is valid when either NDR or ERROR is TRUE. The STATUS value provides the reason for termination of the receive operation in the CM or CB. This is typically a positive value, indicating that the receive operation was successful and that the receive process terminated normally. If the STATUS value is negative (the Most Significant Bit of the hexadecimal value is set), the receive operation was terminated for an error condition such as parity, framing, or overrun errors.

Each PtP communication interface can buffer up to a maximum of 1024 bytes. This could be one large message or several smaller messages. If more than one message is available in the CM or CB, the RCV_PTP instruction returns the oldest message available. A subsequent RCV_PTP instruction execution returns the next oldest message available.

Table 13- 111 Condition codes

STATUS (W#16#...)	Description
0000	No buffer present
0094	Message terminated due to received maximum character length
0095	Message terminated because of message timeout
0096	Message terminated because of inter-character timeout
0097	Message terminated because of response timeout
0098	Message terminated because the "N+LEN+M" length condition was satisfied
0099	Message terminated because of end sequence was satisfied
80E0	Message terminated because the receive buffer is full
80E1	Message terminated due to parity error
80E2	Message terminated due to framing error
80E3	Message terminated due to overrun error
80E4	Message terminated because calculated length exceeds buffer size
80E5	Reverse bias signal (wire break condition)
833A	The DB for the BUFFER parameter does not exist.

13.6.1.6 RCV_RST (Delete receive buffer)

Table 13- 112 RCV_RST (Receiver Reset) instruction

LAD / FBD	SCL	Description

	`"RCV_RST_DB"(`
	`  REQ:=_bool_in_,`
	`  PORT:=_uint_in_,`
	`  DONE=>_bool_out_,`
	`  ERROR=>_bool_out_,`
	`  STATUS=>_word_out_);`
		RCV_RST clears the receive buffers in the CM or CB.

[1] STEP 7 automatically creates the DB when you insert the instruction.

Table 13- 113 Data types for parameters

Parameter and type		Data type	Description
REQ	IN	Bool	Activates the receiver reset on the rising edge of this enable input (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
DONE	OUT	Bool	When TRUE for one scan, indicates that the last request was completed without errors.
ERROR	OUT	Bool	When TRUE, shows that the last request was completed with errors. Also, when this output is TRUE, the STATUS output will contain related error codes.
STATUS	OUT	Word	Error code (Default value: 0) See Common parameters for Point-to-Point instructions (Page 1088) for communication status codes.

Note

You might want to use the RCV_RST instruction to be sure the message buffers are clear following a communications error, or after changing a communication parameter such as the baud rate. Executing RCV_RST causes the module to clear all of the internal message buffers. After clearing the message buffers, you can be assured that when your program executes a subsequent receive instruction, the messages it returns are new messages and not old messages from some time prior to the RCV_RST call.

13.6.1.7 SGN_GET (Query RS-232 signals)

Table 13- 114 SGN_GET (Get RS232 signals) instruction

LAD / FBD	SCL	Description

	`"SGN_GET_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_uint_in_,`
	`NDR=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`DTR=>_bool_out_,`
	`DSR=>_bool_out_,`
	`RTS=>_bool_out_,`
	`CTS=>_bool_out_,`
	`DCD=>_bool_out_,`
	`RING=>_bool_out_);`
		SGN_GET reads the current states of RS232 communication signals.
		This function is valid only for the RS232 CM.

[1] STEP 7 automatically creates the DB when you insert the instruction.

Table 13- 115 Data types for the parameters

Parameter and type		Data type	Description
REQ	IN	Bool	Get RS232 signal state values on the rising edge of this input (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table.
NDR	OUT	Bool	TRUE for one scan, when new data is ready and the operation is complete with no errors
ERROR	OUT	Bool	TRUE for one scan, after the operation was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)
DTR	OUT	Bool	Data terminal ready, module ready (output). Default value: False
DSR	OUT	Bool	Data set ready, communication partner ready (input). Default value: False
RTS	OUT	Bool	Request to send, module ready to send (output). Default value: False
CTS	OUT	Bool	Clear to send, communication partner can receive data (input). Default value: False
DCD	OUT	Bool	Data carrier detect, receive signal level (always False, not supported)
RING	OUT	Bool	Ring indicator, indication of incoming call (always False, not supported)

Table 13- 116 Condition codes

STATUS (W#16#....)	Description
80F0	CM or CB is RS485 and no signals are available

13.6.1.8 SGN_SET (Set RS-232 signals)

Table 13- 117 SGN_SET (Set RS232 signals) instruction

LAD / FBD	SCL	Description

	`"SGN_SET_DB"(`
	`REQ:=_bool_in_,`
	`PORT:=_uint_in_,`
	`SIGNAL:=_byte_in_,`
	`RTS:=_bool_in_,`
	`DTR:=_bool_in_,`
	`DSR:=_bool_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_);`
		SGN_SET sets the states of RS232 communication signals.
		This function is valid only for the RS232 CM.

[1] STEP 7 automatically creates the DB when you insert the instruction.

Table 13- 118 Data types for parameters

Parameter and type		Data type	Description
REQ	IN	Bool	Start the set RS232 signals operation, on the rising edge of this input (Default value: False)
PORT	IN	PORT	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table. (Default value: 0)
SIGNAL	IN	Byte	Selects which signal to set: (multiple allowed). Default value: 0 • 01H = Set RTS • 02H = Set DTR • 04H = Set DSR
RTS	IN	Bool	Request to send, module ready to send value to set (true or false), Default value: False
DTR	IN	Bool	Data terminal ready, module ready to send value to set (true or false). Default value: False
DSR	IN	Bool	Data set ready (only applies to DCE type interfaces), not used.
DONE	OUT	Bool	TRUE for one execution after the last request was completed with no error
ERROR	OUT	Bool	TRUE for one execution after the last request was completed with an error
STATUS	OUT	Word	Execution condition code (Default value: 0)

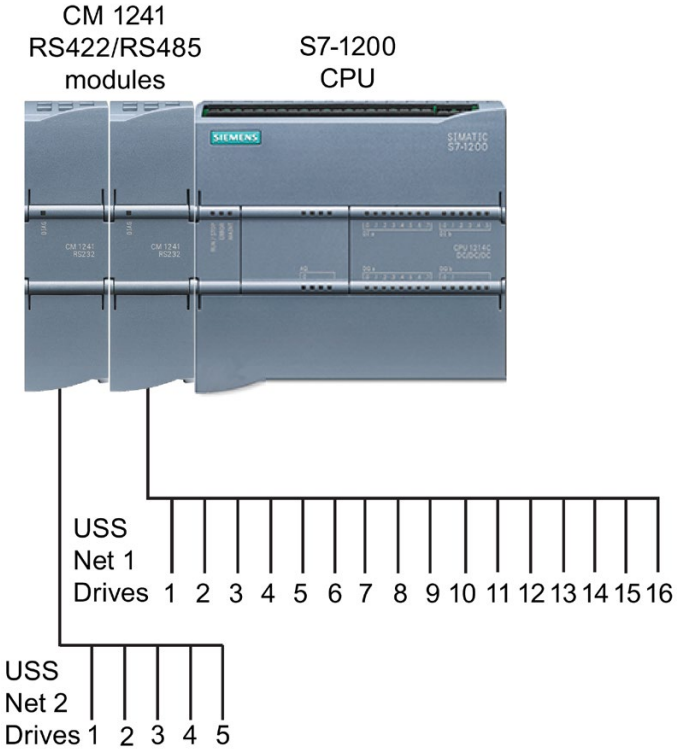

Table 13- 119 Condition codes

STATUS (W#16#....)	Description
80F0	CM or CB is RS485 and no signals can be set
80F1	Signals cannot be set because of Hardware flow control
80F2	Cannot set DSR because module is DTE
80F3	Cannot set DTR because module is DCE

13.7 Legacy USS communication (CM/CB 1241 only)

The USS instructions control the operation of motor drives which support the universal serial interface (USS) protocol. You can use the USS instructions to communicate with multiple drives through RS485 connections to CM 1241 RS485 communication modules or a CB 1241 RS485 communication board. Up to three CM 1241 RS422/RS485 modules and one CB 1241 RS485 board can be installed in a S7-1200 CPU. Each RS485 port can operate up to sixteen drives.

The USS protocol uses a master-slave network for communications over a serial bus. The master uses an address parameter to send a message to a selected slave. A slave itself can never transmit without first receiving a request to do so. Direct message transfer between the individual slaves is not possible. USS communication operates in half-duplex mode. The following USS illustration shows a network diagram for an example drive application.

Prior to the release of STEP 7 V13 SP1 and the S7-1200 V4.1 CPUs, the USS communication instructions existed with different names, and in some cases, slightly different interfaces. The general concepts apply to both sets of instructions. Refer to the individual legacy USS instructions for programming information.

13.7.1 Selecting the version of the USS instructions

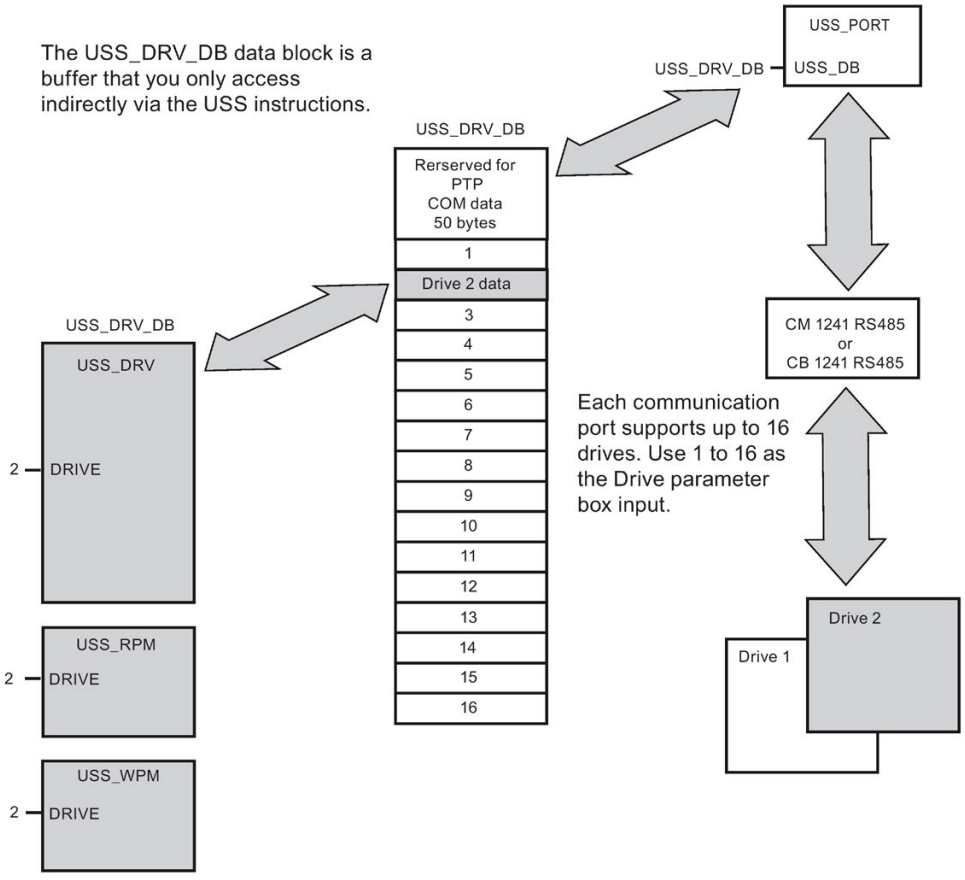
There are two versions of USS instructions available in STEP 7:

- Version 2.0 was initially available in STEP 7 Basic/Professional V13.
- Version 2.1 is available in STEP 7 Basic/Professional V13 SP1 or later.

For compatibility and ease of migration, you can choose which instruction version to insert into your user program.

You cannot use both versions of the instructions with the same module, but two different modules can use different versions of the instructions.

Click the icon on the instruction tree task card to enable the headers and columns of the instruction tree.



To change the version of the USS instructions, select the version from the drop-down list. You can select the group or individual instructions.

When you use the instruction tree to place a USS instruction in your program, a new FB or FC instance, depending on the USS instruction selected, is created in the project tree. You can see new FB or FC instance in the project tree under PLC_x > Program blocks > System blocks > Program resources.

To verify the version of a USS instruction in a program, you must inspect project tree properties and not the properties of a box displayed in the program editor. Select a project tree USS FB or FC instance, right-click, select "Properties", and select the "Information" page to see the USS instruction version number.

13.7.2 Requirements for using the USS protocol

The four USS instructions use 1 FB and 3 FCs to support the USS protocol. One USS_PORT instance data block (DB) is used for each USS network. The USS_PORT instance data block contains temporary storage and buffers for all drives on that USS network. The USS instructions share the information in this data block.

All drives (up to 16) connected to a single RS485 port are part of the same USS network. All drives connected to a different RS485 port are part of a different USS network. Each USS network is managed using a unique data block. All instructions associated with a single USS network must share this data block. This includes all USS_DRV, USS_PORT, USS_RPM, and USS_WPM instructions used to control all drives on a single USS network.

The USS_DRV instruction is a Function Block (FB). When you place the USS_DRV instruction into the program editor, you will be prompted by the "Call options" dialog to assign a DB for this FB. If this is the first USS_DRV instruction in this program for this USS network, then you can accept the default DB assignment (or change the name if you wish) and the new DB is created for you. If however this is not the first USS_DRV instruction for this channel, then you must use the drop-down list in the "Call options" dialog to select the DB name that was previously assigned for this USS network.

Instructions USS_PORT, USS_RPM, and USS_WPM are all Functions (FCs). No DB is assigned when you place these FCs in the editor. Instead, you must assign the appropriate DB reference to the "USS_DB" input of these instructions. Double-click on the parameter field and then click on the parameter helper icon to see the available DB names).

The USS_PORT function handles the actual communication between the CPU and the drives via the Point-to-Point (PtP) RS485 communication port. Each call to this function handles one communication with one drive. Your program must call this function fast enough to prevent a communication timeout by the drives. You may call this function in a main program cycle OB or any interrupt OB.

Typically, you should call the USS_PORT function from a cyclic interrupt OB. The cycle time of the cyclic interrupt OB should be set to about half of the minimum call interval (As an example, 1200 baud communication should use a cyclic time of 350 ms or less).

The USS_DRV function block provides your program access to a specified drive on the USS network. Its inputs and outputs are the status and controls for the drive. If there are 16 drives on the network, your program must have at least 16 USS_DRV calls, one for each drive. These blocks should be called at the rate that is required to control the operation of the drive.

You may only call the USS_DRV function block from a main program cycle OB.

CAUTION

Considerations in calling USS instructions from OBs

Only call USS_DRV, USS_RPM, and USS_WPM from a main program cycle OB. The USS_PORT function can be called from any OB, usually from a cyclic interrupt OB.

Do not use instructions USS_DRV, USS_RPM, or USS_WPM in a higher priority OB than the corresponding USS_PORT instruction. For example, do not place the USS_PORT in the main and a USS_RPM in a cyclic interrupt OB. Failure to prevent interruption of USS_PORT execution can produce unexpected errors, which could result in personal injury.

The USS_RPM and USS_WPM functions read and write the remote drive operating parameters. These parameters control the internal operation of the drive. See the drive manual for the definition of these parameters. Your program can contain as many of these functions as necessary, but only one read or write request can be active per drive, at any given time. You may only call the USS_RPM and USS_WPM functions from a main program cycle OB.

Calculating the time required for communicating with the drive

Communications with the drive are asynchronous to the S7-1200 scan cycle. The S7-1200 typically completes several scans before one drive communications transaction is completed.

The USS_PORT interval is the time required for one drive transaction. The table below shows the minimum USS_PORT interval for each communication baud rate. Calling the USS_PORT function more frequently than the USS_PORT interval will not increase the number of transactions. The drive timeout interval is the amount of time that might be taken for a transaction, if communications errors caused 3 tries to complete the transaction. By default, the USS protocol library automatically does up to 2 retries on each transaction.

Table 13- 120 Calculating the time requirements

Baud rate	Calculated minimum USS_PORT call Interval (milliseconds)	Drive message interval timeout per drive (milliseconds)
1200	790	2370
2400	405	1215
4800	212.5	638
9600	116.3	349
19200	68.2	205
38400	44.1	133
57600	36.1	109
115200	28.1	85

13.7.3 Legacy USS instructions

13.7.3.1 USS_PORT (Edit communication using USS network) instruction

Table 13- 121 USS_PORT instruction

LAD / FBD	SCL	Description

	`USS_PORT(`
	`  PORT:=_uint_in_,`
	`  BAUD:=_dint_in_,`
	`  ERROR=>_bool_out_,`
	`  STATUS=>_word_out_,`
	`  USS_DB:=_fbtref_inout_);`
		The USS_PORT instruction handles communication over a USS network.

Table 13- 122 Data types for the parameters

Parameter and type		Data type	Description
PORT	IN	Port	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table.
BAUD	IN	DInt	The baud rate used for USS communication.
USS_DB	INOUT	USS_BASE	The name of the instance DB that is created and initialized when a USS_DRV instruction is placed in your program.
ERROR	OUT	Bool	When true, this output indicates that an error has occurred and the STATUS output is valid.
STATUS	OUT	Word	The status value of the request indicates the result of the scan or initialization. Additional information is available in the "USS_Extended_Error" variable for some status codes.

Typically, there is only one USS_PORT instruction per PtP communication port in the program, and each call of this function handles a transmission to or from a single drive. All USS functions associated with one USS network and PtP communication port must use the same instance DB.

Your program must execute the USS_PORT instruction often enough to prevent drive timeouts. USS_PORT is usually called from a cyclic interrupt OB to prevent drive timeouts and keep the most recent USS data updates available for USS_DRV calls.

13.7.3.2 USS_DRV (Swap data with drive) instruction

Table 13- 123 USS_DRV instruction

LAD / FBD	SCL	Description
Default view  Expanded view  	"USS_DRV_DB"(RUN:=_bool_in_, OFF2:=_bool_in_, OFF3:=_bool_in_, F_ACK:=_bool_in_, DIR:=_bool_in_, DRIVE:=_usint_in_, PZD_LEN:=_usint_in_, SPEED_SP:=_real_in_, CTRL3:=_word_in_, CTRL4:=_word_in_, CTRL5:=_word_in_, CTRL6:=_word_in_, CTRL7:=_word_in_, CTRL8:=_word_in_, NDR=>_bool_out_, ERROR=>_bool_out_, STATUS=>_word_out_, RUN_EN=>_bool_out_, D_DIR=>_bool_out_, INHIBIT=>_bool_out_, FAULT=>_bool_out_, SPEED=>_real_out_, STATUS1=>_word_out_, STATUS3=>_word_out_, STATUS4=>_word_out_, STATUS5=>_word_out_, STATUS6=>_word_out_, STATUS7=>_word_out_, STATUS8=>_word_out_);	The USS_DRV instruction exchanges data with a drive by creating request messages and interpreting the drive response messages. A separate function block should be used for each drive, but all USS functions associated with one USS network and PtP communication port must use the same instance data block. You must create the DB name when you place the first USS_DRV instruction and then reference the DB that was created by the initial instruction usage. STEP 7 automatically creates the DB when you insert the instruction.

[1] LAD and FBD: Expand the box to reveal all the parameters by clicking the bottom of the box. The parameter pins that are grayed are optional and parameter assignment is not required.

Table 13- 124 Data types for the parameters

Parameter and type		Data type	Description
RUN	IN	Bool	Drive start bit: When true, this input enables the drive to run at the preset speed. When RUN goes to false while a drive is running, the motor will be ramped down to a stop. This behavior differs from the dropping power (OFF2) or braking the motor (OFF3).
OFF2	IN	Bool	Electrical stop bit: When false, this bit causes the drive to coast to a stop with no braking.
OFF3	IN	Bool	Fast stop bit: When false, this bit causes a fast stop by braking the drive rather than just allowing the drive to coast to a stop.
F_ACK	IN	Bool	Fault acknowledge bit: This bit is set to reset the fault bit on a drive. The bit is set after the fault is cleared to indicate to the drive it no longer needs to indicate the previous fault.
DIR	IN	Bool	Drive direction control: This bit is set to indicate that the direction is forward (for positive SPEED_SP).
DRIVE	IN	USInt	Drive address: This input is the address of the USS drive. The valid range is drive 1 to drive 16.
PZD_LEN	IN	USInt	Word length: This is the number of words of PZD data. The valid values are 2, 4, 6, or 8 words. The default value is 2.
SPEED_SP	IN	Real	Speed set point: This is the speed of the drive as a percentage of configured frequency. A positive value specifies forward direction (when DIR is true). Valid range is 200.00 to -200.00.
CTRL3	IN	Word	Control word 3: A value written to a user-configurable parameter on the drive. You must configure this on the drive. (optional parameter)
CTRL4	IN	Word	Control word 4: A value written to a user-configurable parameter on the drive. You must configure this on the drive. (optional parameter)
CTRL5	IN	Word	Control word 5: A value written to a user-configurable parameter on the drive. You must configure this on the drive. (optional parameter)
CTRL6	IN	Word	Control word 6: A value written to a user-configurable parameter on the drive. You must configure this on the drive. (optional parameter)
CTRL7	IN	Word	Control word 7: A value written to a user-configurable parameter on the drive. You must configure this on the drive. (optional parameter)
CTRL8	IN	Word	Control word 8: A value written to a user-configurable parameter on the drive. You must configure this on the drive. (optional parameter)
NDR	OUT	Bool	New data ready: When true, the bit indicates that the outputs contain data from a new communication request.
ERROR	OUT	Bool	Error occurred: When true, this indicates that an error has occurred and the STATUS output is valid. All other outputs are set to zero on an error. Communication errors are only reported on the USS_PORT instruction ERROR and STATUS outputs.
STATUS	OUT	Word	The status value of the request indicates the result of the scan. This is not a status word returned from the drive.
RUN_EN	OUT	Bool	Run enabled: This bit indicates whether the drive is running.
D_DIR	OUT	Bool	Drive direction: This bit indicates whether the drive is running forward.
INHIBIT	OUT	Bool	Drive inhibited: This bit indicates the state of the inhibit bit on the drive.
FAULT	OUT	Bool	Drive fault: This bit indicates that the drive has registered a fault. You must fix the problem and then set the F_ACK bit to clear this bit when set.

Parameter and type		Data type	Description
SPEED	OUT	Real	Drive Current Speed (scaled value of drive status word 2): The value of the speed of the drive as a percentage of configured speed.
STATUS1	OUT	Word	Drive Status Word 1: This value contains fixed status bits of a drive.
STATUS3	OUT	Word	Drive Status Word 3: This value contains a user-configurable status word on the drive.
STATUS4	OUT	Word	Drive Status Word 4: This value contains a user-configurable status word on the drive.
STATUS5	OUT	Word	Drive Status Word 5: This value contains a user-configurable status word on the drive.
STATUS6	OUT	Word	Drive Status Word 6: This value contains a user-configurable status word on the drive.
STATUS7	OUT	Word	Drive Status Word 7: This value contains a user-configurable status word on the drive.
STATUS8	OUT	Word	Drive Status Word 8: This value contains a user-configurable status word on the drive.

When the initial USS_DRV execution occurs, the drive indicated by the USS address (parameter DRIVE) is initialized in the Instance DB. After this initialization, subsequent executions of USS_PORT can begin communication to the drive at this drive number.

Changing the drive number requires a CPU STOP-to-RUN mode transition that initializes the instance DB. Input parameters are configured into the USS TX message buffer and outputs are read from a "previous" valid response buffer if any exists. There is no data transmission during USS_DRV execution. Drives communicate when USS_PORT is executed. USS_DRV only configures the messages to be sent and interprets data that might have been received from a previous request.

You can control the drive direction of rotation using either the DIR input (Bool) or using the sign (positive or negative) with the SPEED_SP input (Real). The following table indicates how these inputs work together to determine the drive direction, assuming the motor is wired for forward rotation.

Table 13- 125 Interaction of the SPEED_SP and DIR parameters

SPEED_SP	DIR	Drive rotation direction
Value > 0	0	Reverse
Value > 0	1	Forward
Value < 0	0	Forward
Value < 0	1	Reverse

13.7.3.3 USS_RPM (Readout parameters from the drive) instruction

Table 13- 126 USS_RPM instruction

LAD / FBD	SCL	Description

	`USS_RPM(REQ:=_bool_in_,`
	`DRIVE:=_usint_in_,`
	`PARAM:=_uint_in_,`
	`INDEX:=_uint_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`VALUE=>_variant_out_,`
	`USS_DB:=_fbtref_inout_);`
		The USS_RPM instruction reads a parameter from a drive. All USS functions associated with one USS network and PtP communication port must use the same data block. USS_RPM must be called from a main program cycle OB.

Table 13- 127 Data types for the parameters

Parameter type		Data type	Description
REQ	IN	Bool	Send request: When true, REQ indicates that a new read request is desired. This is ignored if the request for this parameter is already pending.
DRIVE	IN	USInt	Drive address: DRIVE is the address of the USS drive. The valid range is drive 1 to drive 16.
PARAM	IN	UInt	Parameter number: PARAM designates which drive parameter is written. The range of this parameter is 0 to 2047. On some drives, the most significant byte can access PARAM values greater than 2047. See your drive manual for details on how to access an extended range.
INDEX	IN	UInt	Parameter index: INDEX designates which Drive Parameter index is to be written. A 16-bit value where the Least Significant Byte is the actual index value with a range of (0 to 255). The Most Significant Byte may also be used by the drive and is drive-specific. See your drive manual for details.
USS_DB	INOUT	USS_BASE	The name of the instance DB that is created and initialized when a USS_DRV instruction is placed in your program.
VALUE	IN	Word, Int, UInt, DWord, DInt, UDInt, Real	This is the value of the parameter that was read and is valid only when the DONE bit is true.
DONE[1]	OUT	Bool	When true, indicates that the VALUE output holds the previously requested read parameter value. This bit is set when USS_DRV sees the read response data from the drive. This bit is reset when either: you request the response data via another USS_RPM poll, or on the second of the next two calls to USS_DRV

Parameter type		Data type	Description
ERROR	OUT	Bool	Error occurred: When true, ERROR indicates that an error has occurred and the STATUS output is valid. All other outputs are set to zero on an error. Communication errors are only reported on the USS_PORT instruction ERROR and STATUS outputs.
STATUS	OUT	Word	STATUS indicates the result of the read request. Additional information is available in the "USS_Extended_Error" variable for some status codes.

[1] The DONE bit indicates that valid data has been read from the referenced motor drive and delivered to the CPU. It does not indicate that the USS library is capable of immediately reading another parameter. A blank PKW request must be sent to the motor drive and must also be acknowledged by the instruction before the parameter channel for the specific drive becomes available for use. Immediately calling a USS_RPM or USS_WPM FC for the specified motor drive will result in a 0x818A error.

13.7.3.4 USS_WPM (Change parameters in the drive) instruction

Note

EEPROM write operations (for the EEPROM inside a USS drive)

Do not overuse the EEPROM permanent write operation. Minimize the number of EEPROM write operations to extend the EEPROM life.

Table 13- 128 USS_WPM instruction

LAD / FBD	SCL	Description

	`USS_WPM(REQ:=_bool_in_,`
	`DRIVE:=_usint_in_,`
	`PARAM:=_uint_in_,`
	`INDEX:=_uint_in_,`
	`EEPROM:=_bool_in_,`
	`VALUE:=_variant_in_,`
	`DONE=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`USS_DB:=_fbtref_inout_);`
		The USS_WPM instruction modifies a parameter in the drive. All USS functions associated with one USS network and PtP communication port must use the same data block.
		USS_WPM must be called from a main program cycle OB.

Table 13- 129 Data types for the parameters

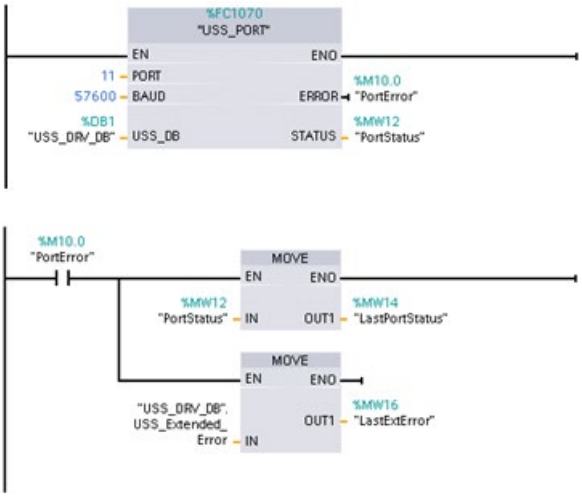
Parameter and type		Data type	Description
REQ	IN	Bool	Send request: When true, REQ indicates that a new write request is desired. This is ignored if the request for this parameter is already pending.
DRIVE	IN	USInt	Drive address: DRIVE is the address of the USS drive. The valid range is drive 1 to drive 16.
PARAM	IN	UInt	Parameter number: PARAM designates which drive parameter is written. The range of this parameter is 0 to 2047. On some drives, the most significant byte can access PARAM values greater than 2047. See your drive manual for details on how to access an extended range.
INDEX	IN	UInt	Parameter index: INDEX designates which Drive Parameter index is to be written. A 16-bit value where the least significant byte is the actual index value with a range of (0 to 255). The most significant byte may also be used by the drive and is drive-specific. See your drive manual for details.
EEPROM	IN	Bool	Store To Drive EEPROM: When true, a write drive parameter transaction will be stored in the drive EEPROM. If false, the write is temporary and will not be retained if the drive is power cycled.
VALUE	IN	Word, Int, UInt, DWord, DInt, UDInt, Real	The value of the parameter that is to be written. It must be valid on the transition of REQ.
USS_DB	INOUT	USS_BASE	The name of the instance DB that is created and initialized when a USS_DRV instruction is placed in your program.
DONE[1]	OUT	Bool	When true, DONE indicates that the input VALUE has been written to the drive. This bit is set when USS_DRV sees the write response data from the drive. This bit is reset when either you request the response data via another USS_WPM poll, or on the second of the next two calls to USS_DRV
ERROR	OUT	Bool	When true, ERROR indicates that an error has occurred and the STATUS output is valid. All other outputs are set to zero on an error. Communication errors are only reported on the USS_PORT instruction ERROR and STATUS outputs.
STATUS	OUT	Word	STATUS indicates the result of the write request. Additional information is available in the "USS_Extended_Error" variable for some status codes.

[1] The DONE bit indicates that valid data has been read from the referenced motor drive and delivered to the CPU. It does not indicate that the USS library is capable of immediately reading another parameter. A blank PKW request must be sent to the motor drive and must also be acknowledged by the instruction before the parameter channel for the specific drive becomes available for use. Immediately calling a USS_RPM or USS_WPM FC for the specified motor drive will result in a 0x818A error.

13.7.4 Legacy USS status codes

USS instruction status codes are returned at the STATUS output of the USS functions.

Table 13- 130 STATUS codes [1]



STATUS (W#16#....)	Description
0000	No error
8180	The length of the drive response did not match the characters received from the drive. The drive number where the error occurred is returned in the "USS_Extended_Error" variable. See the extended error description below this table.
8181	VALUE parameter was not a Word, Real or DWord data type.
8182	The user supplied a Word for a parameter value and received a DWord or Real from the drive in the response.
8183	The user supplied a DWord or Real for a parameter value and received a Word from the drive in the response.
8184	The response telegram from drive had a bad checksum. The drive number where the error occurred is returned in the "USS_Extended_Error" variable. See the extended error description below this table.
8185	Illegal drive address (valid drive address range: 1 to16)
8186	The speed set point is out of the valid range (valid speed SP range: -200% to 200%).
8187	The wrong drive number responded to the request sent. The drive number where the error occurred is returned in the "USS_Extended_Error" variable. See the extended error description below this table.
8188	Illegal PZD word length specified (valid range = 2, 4, 6 or 8 words)
8189	Illegal Baud Rate was specified.
818A	The parameter request channel is in use by another request for this drive.
818B	The drive has not responded to requests and retries. The drive number where the error occurred is returned in the "USS_Extended_Error" variable. See the extended error description below this table.
818C	The drive returned an extended error on a parameter request operation. See the extended error description below this table.
818D	The drive returned an illegal access error on a parameter request operation. See your drive manual for information of why parameter access may be limited.
818E	The drive has not been initialized. This error code is returned to USS_RPM or USS_WPM when USS_DRV, for that drive, has not been called at least once. This keeps the initialization on first scan of USS_DRV from overwriting a pending parameter read or write request, since it initializes the drive as a new entry. To fix this error, call USS_DRV for this drive number.
80Ax-80Fx	Specific errors returned from PtP communication FBs called by the USS Library - These error code values are not modified by the USS library and are defined in the PtP instruction descriptions.

[1] In addition to the USS instruction errors listed above, errors can be returned from the underlying PtP communication instructions.

For several STATUS codes, additional information is provided in the "USS_Extended_Error" variable of the USS_DRV Instance DB. For STATUS codes hexadecimal 8180, 8184, 8187, and 818B, USS_Extended_Error contains the drive number where the communication error occurred. For STATUS code hexadecimal 818C, USS_Extended_Error contains a drive error code returned from the drive when using a USS_RPM or USS_WPM instruction.

Example: communication errors reporting

Communication errors (STATUS = 16#818B) are only reported on the USS_PORT instruction and not on the USS_DRV instruction. For example, if the network is not properly terminated then it is possible for a drive to go to RUN but the USS_DRV instruction will show all 0's for the output parameters. In this case, you can only detect the communication error on the USS_PORT instruction. Since this error is only visible for one scan, you will need to add some capture logic as illustrated in the following example. In this example, when the error bit of the USS_PORT instruction is TRUE, then the STATUS and the USS_Extended_Error values are saved into M memory. The drive number is placed in USS_Extended_Error variable when the STATUS code value is hexadecimal 8180, 8184, 8187, or 818B.

Network 1"PortStatus"port status and"USS_DRV_DB".USS_Extended_ Errorextended error code values are only valid for one program scan. The values must be captured for later processing.

Network 2 The "PortError" contact triggers the storage of the "PortStatus" value in "LastPortStatus" and the"USS_DRV_DB".USS_Extended_Errorvalue in "LastExtError".

Read and write access to drive internal parameters

USS drives support read and write access to a drive's internal parameters. This feature allows remote control and configuration of the drive. Drive parameter access operations can fail due to errors such as values out of range or illegal requests for a drive's current mode. The drive generates an error code value that is returned in the "USS_Extended_Error" variable. This error code value is only valid for the last execution of a USS_RPM or USS_WPM instruction. The drive error code is put into USS_Extended_Error variable when the STATUS code value is hexadecimal 818C. The error code value of "USS_Extended_Error" depends on the drive model. See the drive's manual for a description of the extended error codes for read and write parameter operations.

13.7.5 Legacy USS general drive setup requirements

Legacy USS general drive setup requirements consist of the following points:

- The drives must be set to use 4 PKW words.
- The drives can be configured for 2, 4, 6, or 8 PZD words.
- The number of PZD word's in the drive must match PZD_LEN input on the USS_DRV instruction for that drive.
- The baud rate in all the drives must match the BAUD input on the USS_PORT instruction.
- The drive must be set for remote control.
- The drive must be set for frequency set-point to USS on COM Link.
- The drive address must be set to 1 to 16 and match the DRIVE input on the USS_DRV block for that drive.
- The drive direction control must be set to use the polarity of the drive set-point.
- The RS485 network must be terminated properly.

USS general drive connection and setup is the same for USS instructions (V4.1) and legacy USS instructions (V4.0 and earlier). Refer to the Example: USS general drive connection and setup (Page 1143) for further information.

13.8 Legacy Modbus TCP communication

13.8.1 Overview

Prior to the release of STEP 7 V13 SP1 and the S7-1200 V4.1 CPUs, the Modbus TCP communication instructions existed with different names, and in some cases, slightly different interfaces. The general concepts apply to both sets of instructions. Refer to the individual legacy Modbus TCP instructions for programming information.

13.8.2 Selecting the version of the Modbus TCP instructions

There are three versions of the Modbus TCP instructions available in STEP 7:

- Legacy version 3.0: Compatible with all CPU and CP versions
- Legacy version 3.1: Compatible with all CPU and CP versions
- Version 4.1: Compatible with V4.0 and later CPUs and V2.1 and later CMs

For compatibility and ease of migration, you can choose which instruction version to insert into your user program.

Do not use both 3.0 and 3.1 instruction versions in the same CPU program. Your program's Modbus TCP instructions must have the same major version number (**1**.x, **2**.y, or **V**.z). The individual instructions within a major version group may have different minor versions (1.**x**).

Click the icon on the instruction tree task card to enable the headers and columns of the instruction tree.

To change the version of the Modbus TCP instructions, select the version from the drop-down list. You can select the group or individual instructions.

When you use the instruction tree to place a Modbus TCP instruction in your program, a new FB instance is created in the project tree. You can see new FB instance in the project tree under PLC_x > Program blocks > System blocks > Program resources.

To verify the version of a Modbus TCP instruction in a program, you must inspect project tree properties and not the properties of a box displayed in the program editor. Select a project tree Modbus TCP FB instance, right-click, select "Properties", and select the "Information" page to see the Modbus TCP instruction version number.

13.8.3 Legacy Modbus TCP instructions

13.8.3.1 MB_CLIENT (Communicate using PROFINET as Modbus TCP client)

Table 13- 131 MB_CLIENT instruction

LAD / FBD	SCL	Description

	`"MB_CLIENT_DB"(`
	`REQ:=_bool_in_,`
	`DISCONNECT:=_bool_in_,`
	`CONNECT_ID=_uint_in_,`
	`IP_OCTET_1:=_byte_in_,`
	`IP_OCTET_2:=_byte_in_,`
	`IP_OCTET_3:=_byte_in_,`
	`IP_OCTET_4:=_byte_in_,`
	`IP_PORT:=_uint_in_,`
	`MB_MODE:=_usint_in_,`
	`MB_DATA_ADDR:=_udint_in_,`
	`MB_DATA_LEN:=_uint_in_,`
	`DONE=>_bool_out_,`
	`BUSY=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`MB_DATA_PTR:=_variant_inout_);`
		MB_CLIENT communicates as a Modbus TCP client through the PROFINET connector on the S7-1200 CPU. No additional communication hardware module is required.
		MB_CLIENT can make a client-server connection, send a Modbus function request, receive a response, and control the disconnection from a Modbus TCP server.

Table 13- 132 Data types for the parameters

Parameter and type		Data type	Description
REQ	In	Bool	FALSE = No Modbus communication request TRUE = Request to communicate with a Modbus TCP server
DISCONNECT	IN	Bool	The DISCONNECT parameter allows your program to control connection and disconnection with a Modbus server device. If DISCONNECT = 0 and a connection does not exist, then MB_CLIENT attempts to make a connection to the assigned IP address and port number. If DISCONNECT = 1 and a connection exists, then a disconnect operation is attempted. Whenever this input is enabled, no other operation will be attempted.
CONNECT_ID	IN	UInt	The CONNECT_ID parameter must uniquely identify each connection within the PLC. Each unique instance of the MB_CLIENT or MB_SERVER instruction must contain a unique CONNECT_ID parameter.
IP_OCTET_1	IN	USInt	Modbus TCP server IP address: Octet 1 8-bit part of the 32-bit IPv4 IP address of the Modbus TCPserver to which the client will connect and communicate using the Modbus TCP protocol.
IP_OCTET_2	IN	USInt	Modbus TCP server IP address: Octet 2
IP_OCTET_3	IN	USInt	Modbus TCP server IP address: Octet 3
IP_OCTET_4	IN	USInt	Modbus TCP server IP address: Octet 4
IP_PORT	IN	UInt	Default value = 502: The IP port number of the server to which the client will attempt to connect and ultimately communicate using the TCP/IP protocol.

Parameter and type		Data type	Description
MB_MODE	IN	USInt	Mode Selection: Assigns the type of request (read, write, or diagnostic). See the Modbus functions table below for details.
MB_DATA_ADDR	IN	UDInt	Modbus starting Address: Assigns the starting address of the data to be accessed by MB_CLIENT. See the Modbus functions table below for valid addresses.
MB_DATA_LEN	IN	UInt	Modbus data Length: Assigns the number of bits or words to be accessed in this request. See the Modbus functions table below for valid lengths
MB_DATA_PTR	IN_OUT	Variant	Pointer to the Modbus data register: The register buffers data going to or coming from a Modbus server. The pointer must assign a non-optimized global DB or a M memory address.
DONE	OUT	Bool	The DONE bit is TRUE for one scan, after the last request was completed with no error.
BUSY	OUT	Bool	• 0 - No MB_CLIENT operation in progress • 1 - MB_CLIENT operation in progress
ERROR	OUT	Bool	The ERROR bit is TRUE for one scan, after the MB_CLIENT execution was terminated with an error. The error code value at the STATUS parameter is valid only during the single cycle where ERROR = TRUE.
STATUS	OUT	Word	Execution condition code

REQ parameter

FALSE = No Modbus communication request
TRUE = Request to communicate with a Modbus TCP server

If no instance of MB_CLIENT is active and parameter DISCONNECT=0, when REQ=1 a new Modbus request will start. If the connection is not already established then a new connection will be made.

If the same instance of MB_CLIENT is executed again with DISCONNECT=0 and REQ=1, before the completion of the current request, then no subsequent Modbus transmission will be made. However, as soon as the current request is completed, a new request can be processed if MB_CLIENT is executed with REQ=1.

When the current MB_CLIENT communication request is complete, the DONE bit is TRUE for one cycle. The DONE bit can be used as a time gate to sequence multiple MB_CLIENT requests.

Note

Input data consistency during MB_CLIENT processing

Once a Modbus client initiates a Modbus operation, all the input states are saved internally and are then compared on each successive call. The comparison is used to determine if this particular call was the originator of the active client request. More than one MB_CLIENT call can be performed using a common instance DB.

As a result, it is important that the inputs are not changed during the period of time that a MB_CLIENT operation is actively being processed. If this rule is not followed, then a MB_CLIENT cannot determine that it is the active instance.

MB_MODE and MB_DATA_ADDR parameters select the Modbus communication function

MB_DATA_ADDR assigns the starting Modbus address of the data to be accessed. The MB_CLIENT instruction uses a MB_MODE input rather than a function code input.

The combination of MB_MODE and MB_DATA_ADDR values determine the function code that is used in the actual Modbus message. The following table shows the correspondence between parameter MB_MODE, Modbus function, and Modbus address range.

Table 13- 133 Modbus functions

MB_MODE	Modbus function	Data length	Operation and data	MB_DATA_ADDR
0	01	1 to 2000	Read output bits: 1 to 2000 bits per request	1 to 9999
0	02	1 to 2000	Read input bits: 1 to 2000 bits per request	10001 to 19999
0	03	1 to 125	Read Holding registers: 1 to 125 words per request	40001 to 49999 or 400001 to 465535
0	04	1 to 125	Read input words: 1 to 125 words per request	30001 to 39999
1	05	1	Write one output bit: One bit per request	1 to 9999
1	06	1	Write one holding register: 1 word per request	40001 to 49999 or 400001 to 465535
1	15	2 to 1968	Write multiple output bits: 2 to 1968 bits per request	1 to 9999
1	16	2 to 123	Write multiple holding registers: 2 to 123 words per request	40001 to 49999 or 400001 to 465535
2	15	1 to 1968	Write one or more output bits: 1 to 1968 bits per request	1 to 9999
2	16	1 to 123	Write one or more holding registers: 1 to 123 words per request	40001 to 49999 or 400001 to 465535
11	11	0	Read the server communication status word and event counter. The status word indicates busy (0 – not busy, 0xFFFF - busy). The event counter is incremented for each successful completion of a message. Both the MB_DATA_ADDR and MB_DATA_LEN parameters of MB_CLIENT are ignored for this function.	
80	08	1	Check server status using data diagnostic code 0x0000 (Loopback test – server echoes the request) 1 word per request	

MB_MODE	Modbus function	Data length	Operation and data	MB_DATA_ADDR
81	08	1	Reset server event counter using data diagnostic code 0x000A 1 word per request	
3 to 10, 12 to 79, 82 to 255			Reserved	

Note

MB_DATA_PTR assigns a buffer to store data read/written to/from a Modbus TCP server

The data buffer can be in a non-optimized global DB or M memory address.

For a buffer in M memory, use the standard Any Pointer format. This is in the format P#"Bit Address" "Data Type" "Length", an example would be P#M1000.0 WORD 500.

MB_DATA_PTR assigns a communication buffer

- MB_CLIENT communication functions:
  - Read and write 1-bit data from Modbus server addresses (00001 to 09999)
  - Read 1-bit data from Modbus server addresses (10001 to 19999)
  - Read 16-bit word data from Modbus server addresses (30001 to 39999) and (40001 to 49999)
  - Write 16-bit word data to Modbus server addresses (40001 to 49999)
- Word or bit sized data is transferred to/from the DB or M memory buffer assigned by MB_DATA_PTR.
- If a DB is assigned as the buffer by MB_DATA_PTR, then you must assign data types to all DB data elements.
  - The 1-bit Bool data type represents one Modbus bit address
  - 16-bit single word data types like WORD, UInt, and Int represent one Modbus word address
  - 32-bit double word data types like DWORD, DInt, and Real represent two Modbus word addresses

- Complex DB elements can be assigned by MB_DATA_PTR, such as
  - Standard arrays
  - Named structures where each element is unique.
  - Named complex structures where each element has a unique name and a 16 or 32 bit data type.
- There is no requirement that the MB_DATA_PTR data areas be in the same global data block (or M memory area). You can assign one data block for Modbus reads, another data block for Modbus writes, or one data block for each MB_CLIENT station.

Multiple client connections

A Modbus TCP client can support concurrent connections up to the maximum number of Open User Communications connections allowed by the PLC. The total number of connections for a PLC, including Modbus TCP Clients and Servers, must not exceed the maximum number of supported Open User Communications connections (Page 783). The Modbus TCP connections may be shared between Client and/or Server type connections.

Individual client connections must follow these rules:

- Each MB_CLIENT connection must use a distinct instance DB
- Each MB_CLIENT connection must specify a unique server IP address
- Each MB_CLIENT connection must specify a unique connection ID
- Unique IP port numbers may or may not be required depending upon the server configuration

The Connection ID must be unique for each individual connection. This means a single, unique Connection ID must only be used with each individual instance DB. In summary, the instance DB and the Connection ID are paired together and must be unique for every connection.

Table 13- 134 MB_CLIENT instance data block user accessible static variables

Variable	Data type	Default	description
Blocked_Proc_Timeout	Real	3.0	Amount of time (in seconds) to wait upon a blocked Modbus client instance before removing this instance as being ACTIVE. This can occur, for example, when a client request has been issued and then application stops executing the client function before it has completely finished the request. The maximum S7-1200 limit is 55 seconds.
MB_Unit_ID	Word	255	Modbus unit identifier: A Modbus TCP server is addressed using its IP address. As a result, the MB_UNIT_ID parameter is not used for Modbus TCP addressing. The MB_UNIT_ID parameter corresponds to the slave address in the Modbus RTU protocol. If a Modbus TCP server is used for a gateway to a Modbus RTU protocol, the MB_UNIT_ID can be used to identify the slave device connected on the serial network. The MB_UNIT_ID would be used to forward the request to the correct Modbus RTU slave address. Some Modbus TCP devices may require the MB_UNIT_ID parameter to be initialized within a restricted range of values.
RCV_TIMEOUT	Real	2.0	Time in seconds that the MB_CLIENT waits for a server to respond to a request.
Connected	Bool	0	Indicates whether the connection to the assigned server is connected or disconnected: 1=connected, 0=disconnected

Table 13- 135 MB_CLIENT protocol errors

STATUS (W#16#)	Response code to Modbus client (B#16#)	Modbus protocol errors
8381	01	Function code not supported
8382	03	Data length error
8383	02	Data address error or access outside the bounds of the MB_HOLD_REG address area
8384	03	Data value error
8385	03	Data diagnostic code value not supported (function code 08)

Table 13- 136 MB_CLIENT execution condition codes [1]

STATUS (W#16#)	MB_CLIENT parameter errors
7001	MB_CLIENT is waiting for a Modbus server response to a connect or disconnect request, on the assigned TCP port. This is only reported for the first execution of a connect or disconnect operation.
7002	MB_CLIENT is waiting for a Modbus server response to a connect or disconnect request, for the assigned TCP port. This will be reported for any subsequent executions, while waiting for completion of a connect or disconnect operation.
7003	A disconnect operation has successfully completed (Only valid for one PLC scan).
80C8	The server did not respond in the assigned time. MB_CLIENT must receive a response using the transaction ID that was originally transmitted within the assigned time or this error is returned. Check the connection to the Modbus server device. This error is only reported after any configured retries (if applicable) have been attempted.
8188	Invalid mode value
8189	Invalid data address value
818A	Invalid data length value
818B	Invalid pointer to the DATA_PTR area. This can be the combination of MB_DATA_ADDRESS + MB_DATA_LEN.
818C	Pointer to a optimized DATA_PTR area (must be a non-optimized DB area or M memory area)
8200	The port is busy processing an existing Modbus request.
8380	Received Modbus frame is malformed or too few bytes have been received.
8387	The assigned Connection ID parameter is different from the ID used for previous requests. There can only be a single Connection ID used within each MB_CLIENT instance DB. This is also used as an internal error if the Modbus TCP protocol ID received from a server is not 0.
8388	A Modbus server returned a quantity of data that is different than what was requested. This applies to Modbus functions 15 or 16 only.

[1] In addition to the MB_CLIENT errors listed above, errors can be returned from the underlying T block communication instructions (TCON, TDISCON, TSEND, and TRCV (Page 837)).

13.8.3.2 MB_SERVER (Communicate using PROFINET as Modbus TCP server)

The "MB_SERVER" instruction communicates as Modbus TCP server through the PROFINET connector on the S7-1200 CPU. The "MB_SERVER" instruction processes connection requests of a Modbus TCP client, receives and processes Modbus requests, and sends responses.

To use the instruction, you do not require an additional hardware module.

NOTICE
Security information Note that each client of the network is given read and write access to the process image inputs and outputs and to the data block or bit memory area defined by the Modbus holding register. The option is available to restrict access to an IP address to prevent unauthorized read and write operations. Note, however, that the shared address can also be used for unauthorized access.

Table 13- 137 MB_SERVER instruction

LAD / FBD	SCL	Description

	`"MB_SERVER_DB"(`
	`DISCONNECT:=_bool_in_,`
	`CONNECT_ID:=_uint_in_,`
	`IP_PORT:=_uint_in_,`
	`NDR=>_bool_out_,`
	`DR=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`MB_HOLD_REG:=_variant_inout_);`
		MB_SERVER communicates as a Modbus TCP server through the PROFINET connector on the S7-1200 CPU. No additional communication hardware module is required.
		MB_SERVER can accept a request to connect with Modbus TCP client, receive a Modbus function request, and send a response message.

Table 13- 138 Data types for the parameters

Parameter and type		Data type	Description
DISCONNECT	IN	Bool	MB_SERVER attempts to make a "passive" connection with a partner device. This means that the server is passively listening for a TCP connection request from any requesting IP address. If DISCONNECT = 0 and a connection does not exist, then a passive connection can be initiated. If DISCONNECT = 1 and a connection exists, then a disconnect operation is initiated. This allows your program to control when a connection is accepted. Whenever this input is enabled, no other operation will be attempted.
CONNECT_ID	IN	UInt	CONNECT_ID uniquely identifies each connection within the PLC. Each unique instance of the MB_CLIENT or MB_SERVER instruction must contain a unique CONNECT_ID parameter.
IP_PORT	IN	UInt	Default value = 502: The IP port number that identifies the IP port that will be monitored for a connection request from a Modbus client. These TCP port numbers are not allowed for a MB_SERVER passive connection: 20, 21, 25, 80, 102, 123, 5001, 34962, 34963, and 34964.
MB_HOLD_REG	IN_OUT	Variant	Pointer to the MB_SERVER Modbus holding register: The holding register must either be a non-optimized global DB or a M memory address. This memory area is used to hold the values a Modbus client is allowed to access using Modbus register functions 3 (read), 6 (write), and 16 (write).
NDR	OUT	Bool	New Data Ready: 0 = No new data, 1 = Indicates that new data has been written by a Modbus client
DR	OUT	Bool	Data Read: 0 = No data read, 1 = Indicates that data has been read by a Modbus client.
ERROR	OUT	Bool	The ERROR bit is TRUE for one scan, after MB_SERVER execution was terminated with an error. The error code value at the STATUS parameter is valid only during the single cycle where ERROR = TRUE.
STATUS	OUT	Word	Execution condition code

MB_SERVER allows incoming Modbus function codes (1, 2, 4, 5, and 15) to read or write bits and words directly in the input process image and output process image of the S7-1200 CPU. For data transfer function codes (3, 6, and 16), the MB_HOLD_REG parameter must be defined as a data type larger than a byte. The following table shows the mapping of Modbus addresses to the process image in the CPU.

Table 13- 139 Mapping of Modbus addresses to the process image

Modbus functions						S7-1200	
Codes	Function	Data area	Address range			Data area	CPU address
01	Read bits	Output	1	To	8192	Output Process Image	Q0.0 to Q1023.7
02	Read bits	Input	10001	To	18192	Input Process Image	I0.0 to I1023.7
04	Read words	Input	30001	To	30512	Input Process Image	IW0 to IW1022
05	Write bit	Output	1	To	8192	Output Process Image	Q0.0 to Q1023.7
15	Write bits	Output	1	To	8192	Output Process Image	Q0.0 to Q1023.7

Incoming Modbus message function codes function codes (3, 6, and 16) read or write words in a Modbus holding register which can be an M memory address range or a data block. The type of holding register is specified by the MB_HOLD_REG parameter.

Note

MB_HOLD_REG parameter assignment

The Modbus Holding Register can be in a non-optimized global DB or an M memory address.

For A Modbus holding register in M memory, use the standard Any Pointer format. This is in the format P#"Bit Address" "Data Type" "Length". An example would be P#M1000.0 WORD 500

The following table shows examples of Modbus address to holding register mapping used for Modbus function codes 03 (read words), 06 (write word), and 16 (write words). The actual upper limit of DB addresses is determined by the maximum work memory limit and M memory limit, for each CPU model.

Table 13- 140 Mapping examples of Modbus address to CPU memory address

Modbus Address	MB_HOLD_REG parameter examples		
	P#M100.0 Word 5	P#DB10.DBx0.0 Word 5	"Recipe".ingredient
40001	MW100	DB10.DBW0	"Recipe".ingredient[1]
40002	MW102	DB10.DBW2	"Recipe".ingredient[2]
40003	MW104	DB10.DBW4	"Recipe".ingredient[3]
40004	MW106	DB10.DBW6	"Recipe".ingredient[4]
40005	MW108	DB10.DBW8	"Recipe".ingredient[5]

Multiple server connections

Multiple server connections may be created. This permits a single PLC to establish concurrent connections to multiple Modbus TCP clients.

A Modbus TCP server can support concurrent connections up to the maximum number of Open User Communications connections allowed by the PLC. The total number of connections for a PLC, including Modbus TCP Clients and Servers, must not exceed the maximum number of supported Open User Communications connections (Page 783). The Modbus TCP connections may be shared between Client and/or Server type connections.

Individual server connection must follow these rules:

- Each MB_SERVER connection must use a distinct instance DB.
- Each MB_SERVER connection must be established with a unique IP port number. Only 1 connection per port is supported.
- Each MB_SERVER connection must use a unique connection ID.
- The MB_SERVER must be called individually for each connection (with its respective instance DB).

The Connection ID must be unique for each individual connection. This means a single, unique Connection ID must only be used with each individual instance DB. In summary, the instance DB and the Connection ID are paired together and must be unique for every connection.

Table 13- 141 Modbus diagnostic function codes

MB_SERVER Modbus diagnostic functions		
Codes	Sub-function	Description
08	0x0000	Return query data echo test: The MB_SERVER will echo back to a Modbus client a word of data that is received.
08	0x000A	Clear communication event counter: The MB_SEVER will clear out the communication event counter that is used for Modbus function 11.
11		Get communication event counter: The MB_SERVER uses an internal communication event counter for recording the number of successful Modbus read and write requests that are sent to the Modbus server. The counter does not increment on any Function 8 or Function 11 requests. It is also not incremented on any requests that result in a communication error. The broadcast function is not available for Modbus TCP, because only one client-server connection exists at any one time.

MB_SERVER variables

This table shows the public static variables stored in the MB_SERVER instance data block that can be used in your program

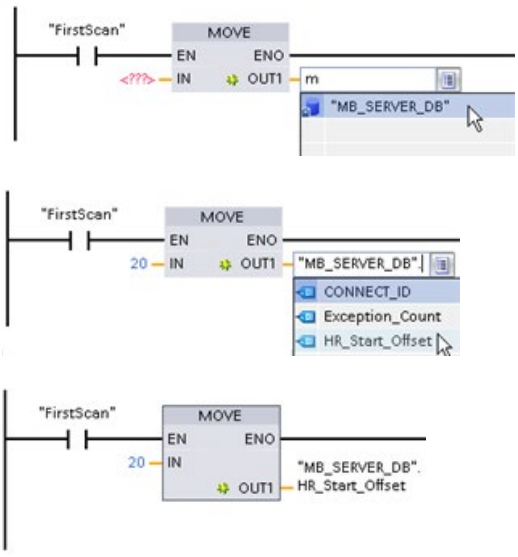
Table 13- 142 MB_SERVER public static variables

Variable	Data type	Default value	Description
HR_Start_Offset	Word	0	Assigns the starting address of the Modbus Holding register
Request_Count	Word	0	The number of all requests received by this server.
Server_Message_Count	Word	0	The number of requests received for this specific server.
Xmt_Rcv_Count	Word	0	The number of transmissions or receptions that have encountered an error. Also, incremented if a message is received that is an invalid Modbus message.
Exception_Count	Word	0	Modbus specific errors that require a returned exception
Success_Count	Word	0	The number of requests received for this specific server that has no protocol errors.
Connected	Bool	0	Indicates whether the connection to the assigned client is connected or disconnected: 1=connected, 0=disconnected

Your program can write values to the HR_Start_Offset and control Modbus server operations. The other variables can be read to monitor Modbus status.

HR_Start_Offset

Modbus holding register addresses begin at 40001. These addresses correspond to the beginning PLC memory address of the holding register. However, you can configure the "HR_Start_Offset" variable to start the beginning Modbus holding register address at another value instead of 40001.



For example, if the holding register is configured to start at MW100 and is 100 words long. An offset of 20 specifies a beginning holding register address of 40021 instead of 40001. Any address below 40021 and above 40119 will result in an addressing error.

Table 13- 143 Example of Modbus holding register addressing

HR_Start_Offset	Address	Minimum	Maximum
0	Modbus address (Word)	40001	40099
	S7-1200 address	MW100	MW298
20	Modbus address (Word)	40021	40119
	S7-1200 address	MW100	MW298

HR_Start_Offset is a word value that specifies the starting address of the Modbus holding register and is stored in the MB_SERVER instance data block. You can set this public static variable value by using the parameter helper drop-list, after MB_SERVER is placed in your program.

For example, after MB_SERVER is placed in a LAD network, you can go to a previous network and assign the HR_Start_Offset value. The value must be assigned prior to execution of MB_SERVER.

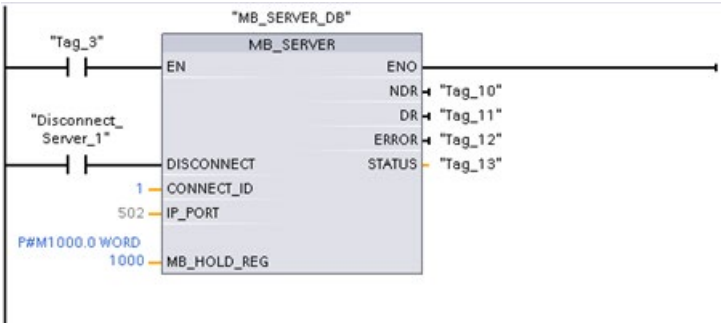
Entering a Modbus server variable using the default DB name:

1. Set the cursor in the parameter field and type an m character.
2. Select "MB_SERVER_DB" from the drop-list of DB names.
3. Select "MB_SERVER_DB.HR_Start_Offset" from the drop-list of DB variables.

Table 13- 144 MB_SERVER execution condition codes [1]

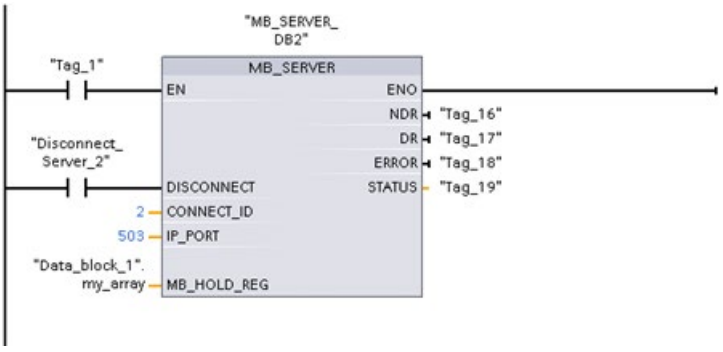
STATUS (W#16#)	Response code to Modbus server (B#16#)	Modbus protocol errors
7001		MB_SERVER is waiting for a Modbus client to connect to the assigned TCP port. This code is reported on the first execution of a connect or disconnect operation.
7002		MB_SERVER is waiting for a Modbus client to connect to the assigned TCP port. This code is reported for any subsequent executions, while waiting for completion of a connect or disconnect operation.
7003		A disconnect operation has successfully completed (Only valid for one PLC scan).
8187		Invalid pointer to MB_HOLD_REG: area is too small
818C		Pointer to an optimized MB_HOLD_REG area (must be a non-optimized DB area or M memory area) or Blocked process timeout exceeds the limit of 55 seconds. (S7-1200 specific)
8381	01	Function code not supported
8382	03	Data length error
8383	02	Data address error or access outside the bounds of the MB_HOLD_REG address area
8384	03	Data value error
8385	03	Data diagnostic code value not supported (function code 08)

[1] In addition to the MB_SERVER errors listed above, errors can be returned from the underlying T block communication instructions (TCON, TDISCON, TSEND, and TRCV (Page 837)).



13.8.4 Legacy Modbus TCP examples

13.8.4.1 Example: Legacy MB_SERVER Multiple TCP connections

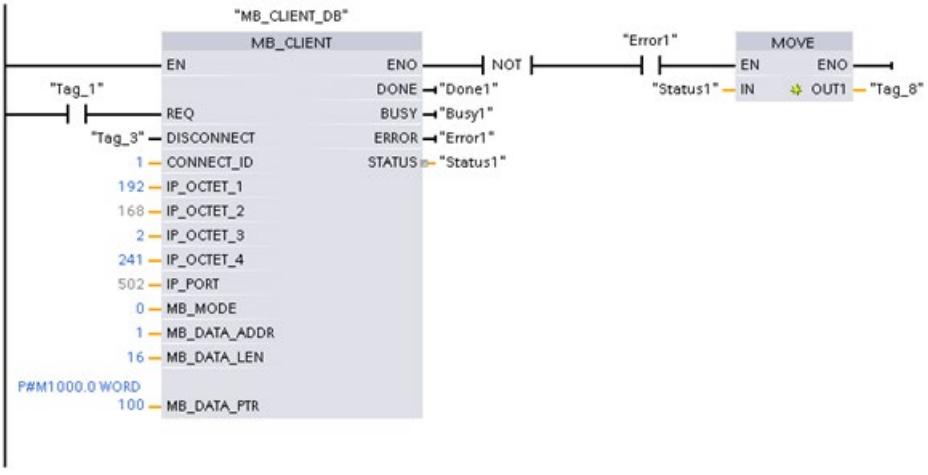


You can have multiple Modbus TCP server connections. To accomplish this, MB_SERVER must be independently executed for each connection. Each connection must use an independent instance DB, connection ID, and IP port. The S7-1200 allows only one connection per IP port.

For best performance, MB_SERVER should be executed every program cycle, for each connection.

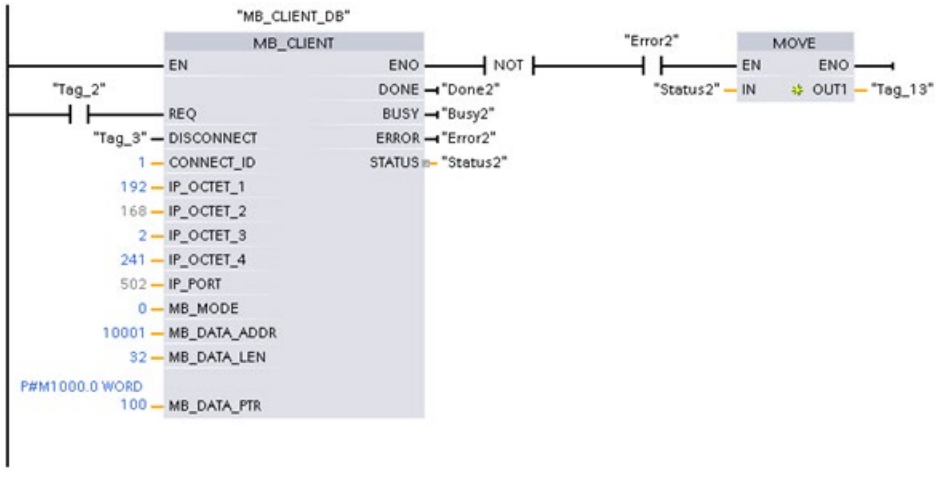
Network 1: Connection #1 with independent IP_PORT, connection ID, and instance DB

Network 2: Connection #2 with independent IP_PORT, connection ID, and instance DB



13.8.4.2 Example: Legacy MB_CLIENT 1: Multiple requests with common TCP connection

Multiple Modbus client requests can be sent over the same connection. To accomplish this, use the same instance DB, connection ID, and port number.



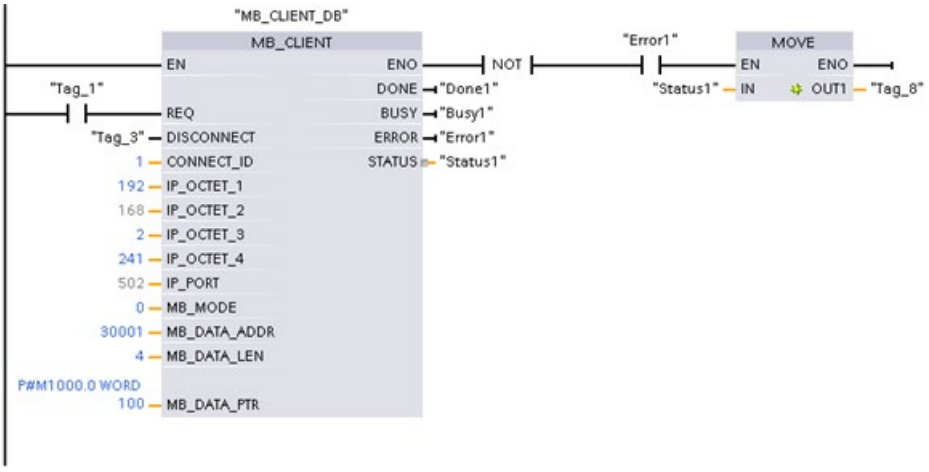
Only 1 client can be active at any given time. Once a client completes its execution, the next client begins execution. Your program is responsible for the order of execution.

The example shows both clients writing to the same memory area. Also, a returned error is captured which is optional.

Network 1: Modbus function 1 - Read 16 output image bits

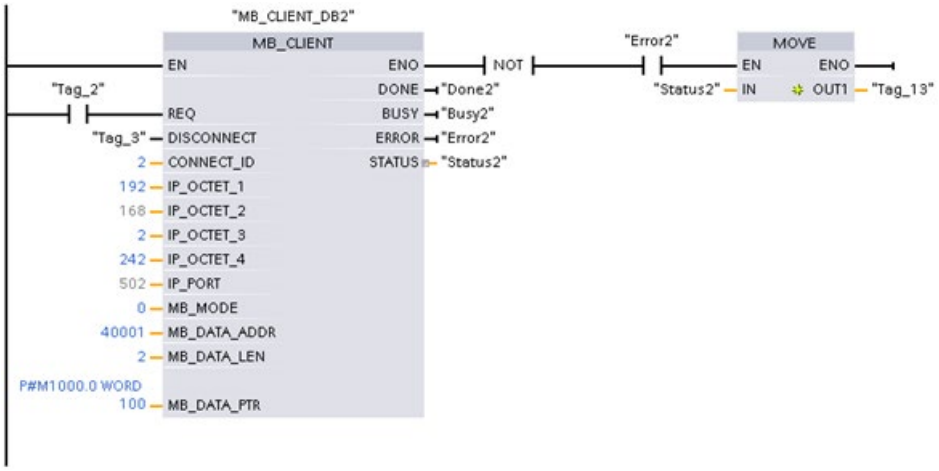
Network 2: Modbus function 2 - Read 32 input image bits

13.8.4.3 Example: Legacy MB_CLIENT 2: Multiple requests with different TCP connections



Modbus client requests can be sent over different connections. To accomplish this, different instance DBs, IP addresses, and connection IDs must be used.

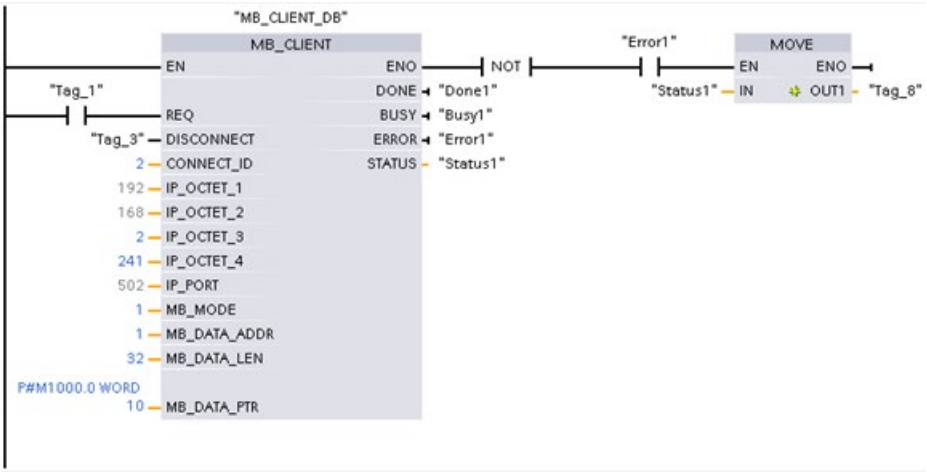
The port number must be different if the connections are established to the same Modbus server. If the connections are on different servers, there is no port number restriction.



The example shows both clients writing to the same memory area. Also, a returned error is captured which is optional.

Network 1:

Modbus function 4 - Read input words (in S7-1200 memory)

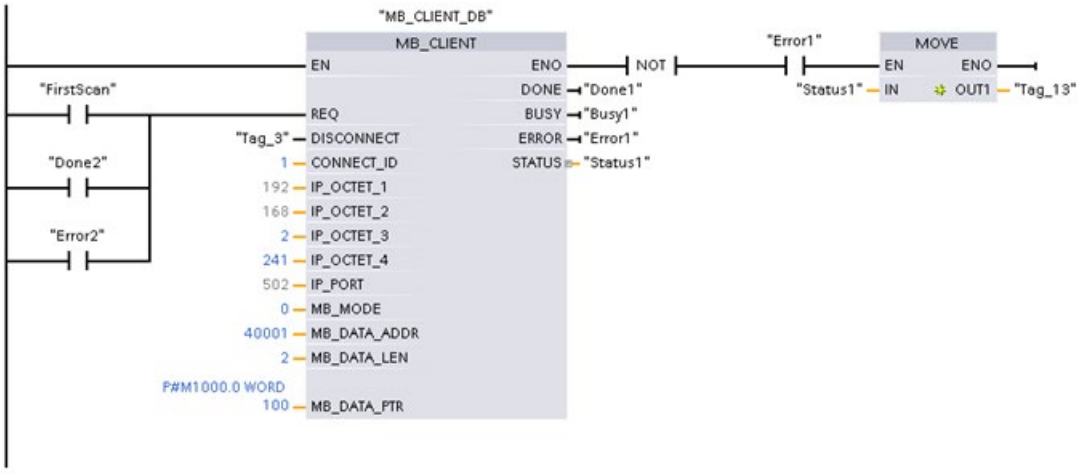


Network 2: Modbus function 3 - Read holding register words from a Modbus TCP server

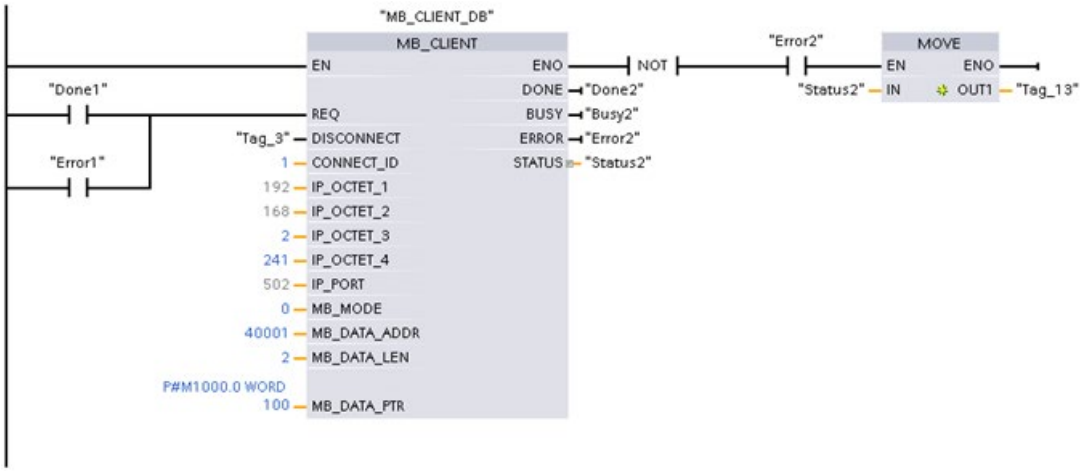
13.8.4.4 Example: Legacy MB_CLIENT 3: Output image write request

This example shows a Modbus client request to write the S7-1200 output image.

Network 1: Modbus function 15 - Write S7-1200 output image bits



13.8.4.5 Example: Legacy MB_CLIENT 4: Coordinating multiple requests



You must ensure that each individual Modbus TCP request finishes execution. This coordination must be provided by your program. The example below shows how the outputs of the first and second client requests can be used to coordinate execution.

The example shows both clients writing to the same memory area. Also, a returned error is captured which is optional.

Network 1: Modbus function 3 - Read holding register words

Network 2: Modbus function 3 - Read holding register words

13.9 Legacy Modbus RTU communication (CM/CB 1241 only)

13.9.1 Overview

Prior to the release of STEP 7 V13 SP1 and the S7-1200 V4.1 CPUs, the Modbus RTU communication instructions existed with different names, and in some cases, slightly different interfaces. The general concepts apply to both sets of instructions. Refer to the individual legacy Modbus RTU instructions for programming information.

13.9.2 Selecting the version of the Modbus RTU instructions

There are two versions of the legacy Modbus RTU instructions available in STEP 7:

- Legacy version 1.3: Compatible with all CPU and CP versions
- Legacy version 2.2: Compatible with all CPU and CP versions

  (Note: The version 2.2 design adds REQ and DONE parameters to MB_COMM_LOAD. Also, the MB_ADDR parameter for MB_MASTER and MB_SLAVE now allows a UInt value for extended addressing.)

For compatibility and ease of migration, you can choose which instruction version to insert into your user program.

You cannot use both versions of the instructions with the same module, but two different modules can use different versions of the instructions. Your program's Modbus RTU instructions must have the same major version number (**1**.x, **2**.y, or **V**.z). The individual instructions within a major version group may have different minor versions (1.**x**).

Click the icon on the instruction tree task card to enable the headers and columns of the instruction tree.

To change the version of the Modbus instructions, select the version from the drop-down list. You can select the group or individual instructions.

When you use the instruction tree to place a Modbus instruction in your program, a new FB instance is created in the project tree. You can see new FB instance in the project tree under PLC_x > Program blocks > System blocks > Program resources.

To verify the version of a Modbus instruction in a program, you must inspect project tree properties and not the properties of a box displayed in the program editor. Select a project tree Modbus FB instance, right-click, select "Properties", and select the "Information" page to see the Modbus instruction version number.

13.9.3 Legacy Modbus RTU instructions

13.9.3.1 MB_COMM_LOAD (Configure port on the PtP module for Modbus RTU)

Table 13- 145 MB_COMM_LOAD instruction

LAD / FBD	SCL	Description

	`"MB_COMM_LOAD_DB"(`
	`REQ:=_bool_in,`
	`PORT:=_uint_in_,`
	`BAUD:=_udint_in_,`
	`PARITY:=_uint_in_,`
	`FLOW_CTRL:=_uint_in_,`
	`RTS_ON_DLY:=_uint_in_,`
	`RTS_OFF_DLY:=_uint_in_,`
	`RESP_TO:=_uint_in_,`
	`DONE=>_bool_out,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`MB_DB:=_fbtref_inout_);`
		The MB_COMM_LOAD instruction configures a PtP port for Modbus RTU protocol communications. Modbus port hardware options: Install up to three CMs (RS485 or RS232), plus one CB (R4845). An instance data block is assigned automatically when you place the MB_COMM_LOAD instruction in your program.

Table 13- 146 Data types for the parameters

Parameter and type		Data type	Description
REQ	IN	Bool	A low to high (positive edge) signal starts the operation. (Version 2.0 only)
PORT	IN	Port	After you install and configure a CM or CB communication device, the port identifier appears in the parameter helper drop-list available at the PORT box connection. The assigned CM or CB port value is the device configuration property "hardware identifier". The port symbolic name is assigned in the "System constants" tab of the PLC tag table.
BAUD	IN	UDInt	Baud rate selection: 300, 600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, 76800, 115200, all other values are invalid
PARITY	IN	UInt	Parity selection: • 0 – None • 1 – Odd • 2 – Even
FLOW_CTRL [1]	IN	UInt	Flow control selection: • 0 – (default) no flow control • 1 – Hardware flow control with RTS always ON (does not apply to RS485 ports) • 2 – Hardware flow control with RTS switched
RTS_ON_DLY [1]	IN	UInt	RTS ON delay selection: • 0 – (default) No delay from RTS active until the first character of the message is transmitted • 1 to 65535 – Delay in milliseconds from RTS active until the first character of the message is transmitted (does not apply to RS485 ports). RTS delays shall be applied independent of the FLOW_CTRL selection.
RTS_OFF_DLY [1]	IN	UInt	RTS OFF delay selection: • 0 – (default) No delay from the last character transmitted until RTS goes inactive • 1 to 65535 – Delay in milliseconds from the last character transmitted until RTS goes inactive (does not apply to RS485 ports). RTS delays shall be applied independent of the FLOW_CTRL selection.
RESP_TO [1]	IN	UInt	Response timeout: Time in milliseconds allowed by MB_MASTER for the slave to respond. If the slave does not respond in this time period, MB_MASTER will retry the request or terminate the request with an error when the specified number of retries has been sent. 5 ms to 65535 ms (default value = 1000 ms).
MB_DB	IN	Variant	A reference to the instance data block used by the MB_MASTER or MB_SLAVE instructions. After MB_SLAVE or MB_MASTER is placed in your program, the DB identifier appears in the parameter helper drop-list available at the MB_DB box connection.
DONE	OUT	Bool	The DONE bit is TRUE for one scan, after the last request was completed with no error. (Version 2.0 only)

Parameter and type		Data type	Description
ERROR	OUT	Bool	The ERROR bit is TRUE for one scan, after the last request was terminated with an error. The error code value at the STATUS parameter is valid only during the single scan where ERROR = TRUE.
STATUS	OUT	Word	Execution condition code

[1] Optional parameters for MB_COMM_LOAD (V 2.x or later). Click the arrow at the bottom of a LAD/FBD box to expand the box and include these parameters.

MB_COMM_LOAD is executed to configure a port for the Modbus RTU protocol. Once a port is configured for the Modbus RTU protocol, it can only be used by either the MB_MASTER or MB_SLAVE instructions.

One execution of MB_COMM_LOAD must be used to configure each communication port that is used for Modbus communication. Assign a unique MB_COMM_LOAD instance DB for each port that you use. You can install up to three communication modules (RS232 or RS485) and one communication board (RS485) in the CPU. Call MB_COMM_LOAD from a startup OB and execute it one time or use the first scan system flag (Page 108) to initiate the call to execute it one time. Only execute MB_COMM_LOAD again if communication parameters like baud rate or parity must change.

An instance data block is assigned for MB_MASTER or MB_SLAVE when you place these instructions in your program. This instance data block is referenced when you specify the MB_DB parameter for the MB_COMM_LOAD instruction.

MB_COMM_LOAD data block variables

The following table shows the public static variables stored in the instance DB for the MB_COMM_LOAD that can be used in your program.

Table 13- 147 Static variables in the instance DB

Variable	Data type	Description
ICHAR_GAP	UInt	Delay for Inter-character gap between characters. This parameter is specified in milliseconds and is used to increase the expected amount of time between received characters. The corresponding number of bit times for this parameter is added to the Modbus default of 35 bit times (3.5 character times).
RETRIES	UInt	Number of retries that the master will attempt before returning the no response error code 0x80C8.
STOP_BITS	USInt	Number of stop bits used in framing each character. Valid values are 1 and 2.

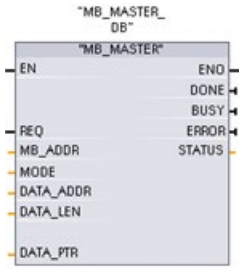
Table 13- 148 MB_COMM_LOAD execution condition codes [1]

STATUS (W#16#)	Description
0000	No error
8180	Invalid port ID value (wrong port/hardware identifier for communication module)
8181	Invalid baud rate value
8182	Invalid parity value
8183	Invalid flow control value
8184	Invalid response timeout value (response timeout less than the 5 ms minimum)
8185	MB_DB parameter is not an instance data block of a MB_MASTER or MB_SLAVE instruction.

[1] In addition to the MB_COMM_LOAD errors listed above, errors can be returned from the underlying PtP communication instructions.

13.9.3.2 MB_MASTER (Communicate using the PtP port as Modbus RTU master)

Table 13- 149 MB_MASTER instruction



LAD / FBD	SCL	Description
	"MB_MASTER_DB"(REQ:=_bool_in_, MB_ADDR:=_uint_in_, MODE:=_usint_in_, DATA_ADDR:=_udint_in_, DATA_LEN:=_uint_in_, DONE=>_bool_out_, BUSY=>_bool_out_, ERROR=>_bool_out_, STATUS=>_word_out_, DATA_PTR:=_variant_inout_);	The MB_MASTER instruction communicates as a Modbus master using a port that was configured by a previous execution of the MB_COMM_LOAD instruction. An instance data block is assigned automatically when you place the MB_MASTER instruction in your program. This MB_MASTER instance data block is used when you specify the MB_DB parameter for the MB_COMM_LOAD instruction.

Table 13- 150 Data types for the parameters

Parameter and type		Data type	Description
REQ	IN	Bool	0=No request 1= Request to transmit data to Modbus slave
MB_ADDR	IN	V1.0: USInt V2.0: UInt	Modbus RTU station address: Standard addressing range (1 to 247) Extended addressing range (1 to 65535) The value of 0 is reserved for broadcasting a message to all Modbus slaves. Modbus function codes 05, 06, 15 and 16 are the only function codes supported for broadcast.
MODE	IN	USInt	Mode Selection: Specifies the type of request (read, write, or diagnostic). See the Modbus functions table below for details.
DATA_ADDR	IN	UDInt	Starting Address in the slave: Specifies the starting address of the data to be accessed in the Modbus slave. See the Modbus functions table below for valid addresses.
DATA_LEN	IN	UInt	Data Length: Specifies the number of bits or words to be accessed in this request. See the Modbus functions table below for valid lengths.
DATA_PTR	IN	Variant	Data Pointer: Points to the M or DB address (non-optimized DB type) for the data being written or read.
DONE	OUT	Bool	The DONE bit is TRUE for one scan, after the last request was completed with no error.
BUSY	OUT	Bool	• 0 – No MB_MASTER operation in progress • 1 – MB_MASTER operation in progress
ERROR	OUT	Bool	The ERROR bit is TRUE for one scan, after the last request was terminated with an error. The error code value at the STATUS parameter is valid only during the single scan where ERROR = TRUE.
STATUS	OUT	Word	Execution condition code

Modbus master communication rules

- MB_COMM_LOAD must be executed to configure a port before a MB_MASTER instruction can communicate with that port.
- If a port is to be used to initiate Modbus master requests, that port should not be used by MB_SLAVE. One or more instances of MB_MASTER execution can be used with that port, but all MB_MASTER execution must use the same MB_MASTER instance DB for that port.
- The Modbus instructions do not use communication interrupt events to control the communication process. Your program must poll the MB_MASTER instruction for transmit and receive complete conditions.
- It is recommended that you call all MB_MASTER execution for a given port from a program cycle OB. Modbus master instructions may execute in only one of the program cycle or cyclic/time delay execution levels. They must not execute in both execution priority levels. Pre-emption of a Modbus Master instruction by another Modbus master instruction in a higher priority execution priority level will result in improper operation. Modbus master instructions must not execute in the startup, diagnostic or time error execution priority levels.
- Once a master instruction initiates a transmission, this instance must be continually executed with the EN input enabled until a DONE=1 state or ERROR=1 state is returned. A particular MB_MASTER instance is considered active until one of these two events occurs. While the original instance is active, any call to any other instance with the REQ input enabled will result in an error. If the continuous execution of the original instance stops, the request state remains active for a period of time specified by the static variable Blocked_Proc_Timeout. Once this period of time expires, the next master instruction called with an enabled REQ input will become the active instance. This prevents a single Modbus master instance from monopolizing or locking access to a port. If the original active instance is not enabled within the period of time specified by the static variable "Blocked_Proc_Timeout", then the next execution by this instance (with REQ not set) will clear the active state. If (REQ is set), then this execution initiates a new master request as if no other instance was active.

REQ parameter

0 = No request; 1 = Request to transmit data to Modbus Slave

You may control this input either through the use of a level or edge triggered contact. Whenever this input is enabled, a state machine is started to ensure that no other MB_MASTER using the same instance DB is allowed to issue a request, until the current request is completed. All other input states are captured and held internally for the current request, until the response is received or an error detected.

If the same instance of MB_MASTER is executed again with REQ input = 1 before the completion of the current request, then no subsequent transmissions are made. However, when the request is completed, a new request is issued whenever MB_MASTER is executed again with REQ input = 1.

DATA_ADDR and MODE parameters select the Modbus function type

DATA_ADDR (starting Modbus address in the slave): Specifies the starting address of the data to be accessed in the Modbus slave.

The MB_MASTER instruction uses a MODE input rather than a Function Code input. The combination of MODE and Modbus address determine the Function Code that is used in the actual Modbus message. The following table shows the correspondence between parameter MODE, Modbus function code, and Modbus address range.

Table 13- 151 Modbus functions

MODE	Modbus Function	Data length	Operation and data	Modbus Address
0	01	1 to 2000 1 to 1992 [1]	Read output bits: 1 to (1992 or 2000) bits per request	1 to 9999
0	02	1 to 2000 1 to 1992 [1]	Read input bits: 1 to (1992 or 2000) bits per request	10001 to 19999
0	03	1 to 125 1 to 124 [1]	Read Holding registers: 1 to (124 or 125) words per request	40001 to 49999 or 400001 to 465535
0	04	1 to 125 1 to 124 [1]	Read input words: 1 to (124 or 125) words per request	30001 to 39999
1	05	1	Write one output bit: One bit per request	1 to 9999
1	06	1	Write one holding register: 1 word per request	40001 to 49999 or 400001 to 465535
1	15	2 to 1968 2 to 1960 [1]	Write multiple output bits: 2 to (1960 or 1968) bits per request	1 to 9999
1	16	2 to 123 2 to 122 [1]	Write multiple holding registers: 2 to (122 or 123) words per request	40001 to 49999 or 400001 to 465535
2	15	1 to 1968 2 to 1960 [1]	Write one or more output bits: 1 to (1960 or 1968) bits per request	1 to 9999
2	16	1 to 123 1 to 122 [1]	Write one or more holding registers: 1 to (122 or 123) words per request	40001 to 49999 or 400001 to 465535
11	11	0	Read the slave communication status word and event counter. The status word indicates busy (0 – not busy, 0xFFFF - busy). The event counter is incremented for each successful completion of a message. Both the DATA_ADDR and DATA_LEN operands of MB_MASTER are ignored for this function.	
80	08	1	Check slave status using data diagnostic code 0x0000 (Loopback test – slave echoes the request) 1 word per request	

MODE	Modbus Function	Data length	Operation and data	Modbus Address
81	08	1	Reset slave event counter using data diagnostic code 0x000A 1 word per request	
3 to 10, 12 to 79, 82 to 255			Reserved	

[1] For "Extended Addressing" mode the maximum data lengths are reduced by 1 byte or 1 word depending upon the data type used by the function.

DATA_PTR parameter

The DATA_PTR parameter points to the DB or M address that is written to or read from. If you use a data block, then you must create a global data block that provides data storage for reads and writes to Modbus slaves.

Note

The DATA_PTR data block type must allow direct addressing

The data block must allow both direct (absolute) and symbolic addressing. When you create the data block the "Standard" access attribute must be selected.

Data block structures for the DATA_PTR parameter

- These data types are valid for **word reads** of Modbus addresses 30001 to 39999, 40001 to 49999, and 400001 to 465536 and also for **word writes** to Modbus addresses 40001 to 49999 and 400001 to 465536.
  - Standard array of WORD, UINT, or INT data types
  - Named WORD, UINT, or INT structure where each element has a unique name and 16 bit data type.
  - Named complex structure where each element has a unique name and a 16 or 32 bit data type.
- For **bit reads** and writes of Modbus addresses 00001 to 09999 and bit reads of 10001 to 19999.
  - Standard array of Boolean data types.
  - Named Boolean structure of uniquely named Boolean variables.
- Although not required, it is recommended that each MB_MASTER instruction have its own separate memory area. The reason for this recommendation is that there is a greater possibility of data corruption if multiple MB_MASTER instructions are reading and writing to the same memory area.
- There is no requirement that the DATA_PTR data areas be in the same global data block. You can create one data block with multiple areas for Modbus reads, one data block for Modbus writes, or one data block for each slave station.

Modbus master data block variables

The following table shows the public static variables stored in the instance DB for MB_MASTER that can be used in your program.

Table 13- 152 Static variables in the instance DB

Variable	Data type	Initial value	Description
Blocked_Proc_Timeout	Real	3.0	Amount of time (in seconds) to wait for a blocked Modbus Master instance before removing this instance as being ACTIVE. This can occur, for example, when a Master request has been issued and then the program stops calling the Master function before it has completely finished the request. The time value must be greater than 0 and less than 55 seconds, or an error occurs. The default value is .5 seconds.
Extended_Addressing	Bool	False	Configures single or double-byte slave addressing. The default value = 0. (0=single byte address, 1=double-byte address)

Your program can write values to the Blocked_Proc_Timeout and Extended_Addressing variables to control Modbus master operations. See the MB_SLAVE topic description of HR_Start_Offset and Extended_Addressing for an example of how to use these variables in the program editor and details about Modbus extended addressing (Page 1263).

Condition codes

Table 13- 153 MB_MASTER execution condition codes (communication and configuration errors) [1]

STATUS (W#16#)	Description
0000	No error
80C8	Slave timeout. Check baud rate, parity, and wiring of slave.
80D1	The receiver issued a flow control request to suspend an active transmission and never re-enabled the transmission during the specified wait time. This error is also generated during hardware flow control when the receiver does not assert CTS within the specified wait time.
80D2	The transmit request was aborted because no DSR signal is received from the DCE.
80E0	The message was terminated because the receive buffer is full.
80E1	The message was terminated as a result of a parity error.
80E2	The message was terminated as a result of a framing error.
80E3	The message was terminated as a result of an overrun error.
80E4	The message was terminated as a result of the specified length exceeding the total buffer size.
8180	Invalid port ID value or error with MB_COMM_LOAD instruction
8186	Invalid Modbus station address
8188	Invalid Mode specified for broadcast request
8189	Invalid Data Address value
818A	Invalid Data Length value
818B	Invalid pointer to the local data source/destination: Size not correct
818C	Invalid pointer for DATA_PTR or invalid Blocked_Proc_Timeout: The data area must be a DB (that allows both symbolic and direct access) or M memory.
8200	Port is busy processing a transmit request.

Table 13- 154 MB_MASTER execution condition codes (Modbus protocol errors) [1]

STATUS (W#16#)	Response code from slave	Modbus protocol errors
8380	-	CRC error
8381	01	Function code not supported
8382	03	Data length error
8383	02	Data address error or address outside the valid range of the DATA_PTR area
8384	Greater than 03	Data value error
8385	03	Data diagnostic code value not supported (function code 08)
8386	-	Function code in the response does not match the code in the request.
8387	-	Wrong slave responded
8388	-	The slave response to a write request is incorrect. The write request returned by the slave does not match what the master actually sent.

[1] In addition to the MB_MASTER errors listed above, errors can be returned from the underlying PtP communication instructions.

13.9.3.3 MB_SLAVE (Communicate using the PtP port as Modbus RTU slave)

Table 13- 155 MB_SLAVE instruction

LAD / FBD	SCL	Description

	`"MB_SLAVE_DB"(`
	`MB_ADDR:=_uint_in_,`
	`NDR=>_bool_out_,`
	`DR=>_bool_out_,`
	`ERROR=>_bool_out_,`
	`STATUS=>_word_out_,`
	`MB_HOLD_REG:=_variant_inout_);`
		The MB_SLAVE instruction allows your program to communicate as a Modbus slave through a PtP port on the CM (RS485 or RS232) and CB (RS485). When a remote Modbus RTU master issues a request, your user program responds to the request by MB_SLAVE execution. STEP 7 automatically creates an instance DB when you insert the instruction. Use this MB_SLAVE_DB name when you specify the MB_DB parameter for the MB_COMM_LOAD instruction.

Table 13- 156 Data types for the parameters

Parameter and type		Data type	Description
MB_ADDR	IN	V1.0: USInt V2.0: UInt	The station address of the Modbus slave: Standard addressing range (1 to 247) Extended addressing range (0 to 65535)
MB_HOLD_REG	IN	Variant	Pointer to the Modbus Holding Register DB: The Modbus holding register can be M memory or a data block.
NDR	OUT	Bool	New Data Ready: • 0 – No new data • 1 – Indicates that new data has been written by the Modbus master
DR	OUT	Bool	Data Read: • 0 – No data read • 1 – Indicates that data has been read by the Modbus master
ERROR	OUT	Bool	The ERROR bit is TRUE for one scan, after the last request was terminated with an error. If execution is terminated with an error, then the error code value at the STATUS parameter is valid only during the single scan where ERROR = TRUE.
STATUS	OUT	Word	Execution error code

Modbus communication function codes (1, 2, 4, 5, and 15) can read and write bits and words directly in the input process image and output process image of the CPU. For these function codes, the MB_HOLD_REG parameter must be defined as a data type larger than a byte. The following table shows the example mapping of Modbus addresses to the process image in the CPU.

Table 13- 157 Mapping of Modbus addresses to the process image

Modbus functions						S7-1200	
Codes	Function	Data area	Address range			Data area	CPU address
01	Read bits	Output	1	to	8192	Output Process Image	Q0.0 to Q1023.7
02	Read bits	Input	10001	to	18192	Input Process Image	I0.0 to I1023.7
04	Read words	Input	30001	to	30512	Input Process Image	IW0 to IW1022
05	Write bit	Output	1	to	8192	Output Process Image	Q0.0 to Q1023.7
15	Write bits	Output	1	to	8192	Output Process Image	Q0.0 to Q1023.7

Modbus communication function codes (3, 6, 16) use a Modbus holding register which can be an M memory address range or a data block. The type of holding register is specified by the MB_HOLD_REG parameter on the MB_SLAVE instruction.

Note

MB_HOLD_REG data block type

A Modbus holding register data block must allow both direct (absolute) and symbolic addressing. When you create the data block the "Standard" access attribute must be selected.

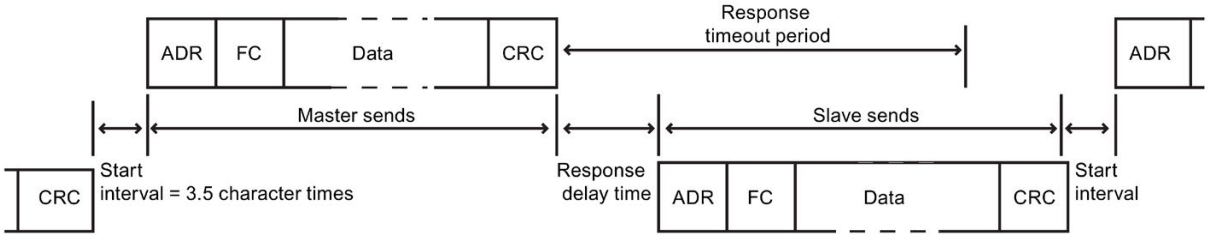
The following table shows examples of Modbus address to holding register mapping that is used for Modbus function codes 03 (read words), 06 (write word), and 16 (write words). The actual upper limit of DB addresses is determined by the maximum work memory limit and M memory limit, for each CPU model.

Table 13- 158 Mapping of Modbus addresses to CPU memory

Modbus Master Address	MB_HOLD_REG parameter examples				
	MW100	DB10.DBw0	MW120	DB10.DBW50	"Recipe".ingredient
40001	MW100	DB10.DBW0	MW120	DB10.DBW50	"Recipe".ingredient[1]
40002	MW102	DB10.DBW2	MW122	DB10.DBW52	"Recipe".ingredient[2]
40003	MW104	DB10.DBW4	MW124	DB10.DBW54	"Recipe".ingredient[3]
40004	MW106	DB10.DBW6	MW126	DB10.DBW56	"Recipe".ingredient[4]
40005	MW108	DB10.DBW8	MW128	DB10.DBW58	"Recipe".ingredient[5]

Table 13- 159 Diagnostic functions

S7-1200 MB_SLAVE Modbus diagnostic functions		
Codes	Sub-function	Description
08	0000H	Return query data echo test: The MB_SLAVE will echo back to a Modbus master a word of data that is received.
08	000AH	Clear communication event counter: The MB_SLAVE will clear out the communication event counter that is used for Modbus function 11.
11		Get communication event counter: The MB_SLAVE uses an internal communication event counter for recording the number of successful Modbus read and write requests that are sent to the Modbus slave. The counter does not increment on any Function 8, Function 11, or broadcast requests. It is also not incremented on any requests that result in a communication error (for example, parity or CRC errors).



The MB_SLAVE instruction supports broadcast write requests from any Modbus master as long as the request is for accessing valid addresses. MB_SLAVE will produce error code 0x8188 for function codes not supported in broadcast.

Modbus slave communication rules

- MB_COMM_LOAD must be executed to configure a port, before a MB_SLAVE instruction can communicate through that port.
- If a port is to respond as a slave to a Modbus master, then do not program that port with the MB_MASTER instruction.
- Only one instance of MB_SLAVE can be used with a given port, otherwise erratic behavior may occur.
- The Modbus instructions do not use communication interrupt events to control the communication process. Your program must control the communication process by polling the MB_SLAVE instruction for transmit and receive complete conditions.
- The MB_SLAVE instruction must execute periodically at a rate that allows it to make a timely response to incoming requests from a Modbus master. It is recommended that you execute MB_SLAVE every scan from a program cycle OB. Executing MB_SLAVE from a cyclic interrupt OB is possible, but is not recommended because of the potential for excessive time delays in the interrupt routine to temporarily block the execution of other interrupt routines.

Modbus signal timing

MB_SLAVE must be executed periodically to receive each request from the Modbus master and then respond as required. The frequency of execution for MB_SLAVE is dependent upon the response timeout period of the Modbus master. This is illustrated in the following diagram.

The response timeout period RESP_TO is the amount of time a Modbus master waits for the start of a response from a Modbus slave. This time period is not defined by the Modbus protocol, but is a parameter of each Modbus master. The frequency of execution (the time between one execution and the next execution) of MB_SLAVE must be based on the particular parameters of your Modbus master. At a minimum, you should execute MB_SLAVE twice within the response timeout period of the Modbus master.

Modbus slave variables

This table shows the public static variables stored in the MB_SLAVE instance data block that can be used in your program

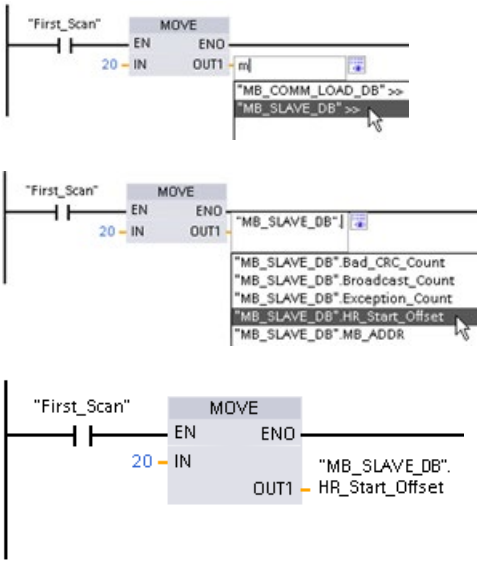
Table 13- 160 Modbus slave variables

Variable	Data type	Description
Request_Count	Word	The number of all requests received by this slave
Slave_Message_Count	Word	The number of requests received for this specific slave
Bad_CRC_Count	Word	The number of requests received that have a CRC error
Broadcast_Count	Word	The number of broadcast requests received
Exception_Count	Word	Modbus specific errors that require a returned exception
Success_Count	Word	The number of requests received for this specific slave that have no protocol errors
HR_Start_Offset	Word	Specifies the starting address of the Modbus Holding register (default = 0)
Extended_Addressing	Bool	Configures single or double-byte slave addressing (0=single byte address, 1=double-byte address, default = 0)

Your program can write values to the HR_Start_Offset and Extended_Addressing variables and control Modbus slave operations. The other variables can be read to monitor Modbus status.

HR_Start_Offset

Modbus holding register addresses begin at 40001 or 400001. These addresses correspond to the beginning PLC memory address of the holding register. However, you can configure the "HR_Start_Offset" variable to start the beginning Modbus holding register address at another value instead of 40001 or 400001.



For example, if the holding register is configured to start at MW100 and is 100 words long. An offset of 20 specifies a beginning holding register address of 40021 instead of 40001. Any address below 40021 and above 400119 will result in an addressing error.

Table 13- 161 Example of Modbus holding register addressing

HR_Start_Offset	Address	Minimum	Maximum
0	Modbus address (Word)	40001	40099
	S7-1200 address	MW100	MW298
20	Modbus address (Word)	40021	40119
	S7-1200 address	MW100	MW298

HR_Start_Offset is a word value that specifies the starting address of the Modbus holding register and is stored in the MB_SLAVE instance data block. You can set this public static variable value by using the parameter helper drop-list, after MB_SLAVE is placed in your program.

For example, after MB_SLAVE is placed in a LAD network, you can go to a previous network and assign the HR_Start_Offset value. The value must be assigned prior to execution of MB_SLAVE.

Entering a Modbus slave variable using the default DB name:

1. Set the cursor in the parameter field and type an m character.
2. Select "MB_SLAVE_DB" from the drop-list.
3. Set the cursor at the right side of the DB name (after the quote character) and enter a period character.
4. Select "MB_SLAVE_DB.HR_Start_Offset" from the drop list.

Extended_Addressing

The Extended_Addressing variable is accessed in a similar way as the HR_Start_Offset reference discussed above except that the Extended_Addressing variable is a Boolean value. The Boolean value must be written by an output coil and not a move box.

Modbus slave addressing can be configured to be either a single byte (which is the Modbus standard) or double byte. Extended addressing is used to address more than 247 devices within a single network. Selecting extended addressing allows you to address a maximum of 64000 addresses. A Modbus function 1 frame is shown below as an example.

Table 13- 162 Single-byte slave address (byte 0)

Function 1	Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	
Request	Slave addr.	F code	Start address		Length of coils		
Valid Response	Slave addr.	F code	Length	Coil data			
Error response	Slave addr.	0x81	E code				

Table 13- 163 Double-byte slave address (byte 0 and byte 1)

	Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6
Request	Slave address		F code	Start address		Length of coils	
Valid Response	Slave address		F code	Length	Coil data		
Error response	Slave address		0x81	E code			

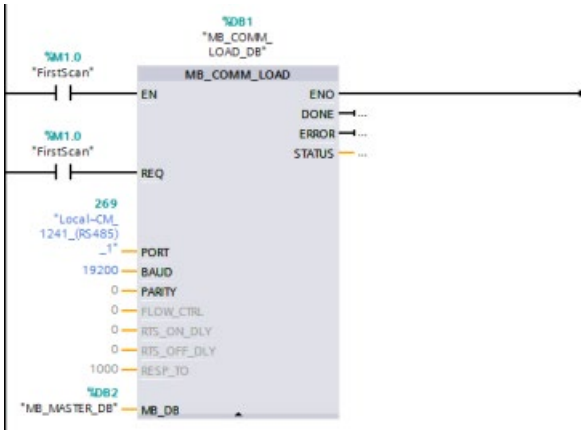
Condition codes

Table 13- 164 MB_SLAVE execution condition codes (communication and configuration errors) [1]

STATUS (W#16#)	Description
80D1	The receiver issued a flow control request to suspend an active transmission and never re-enabled the transmission during the specified wait time. This error is also generated during hardware flow control when the receiver does not assert CTS within the specified wait time.
80D2	The transmit request was aborted because no DSR signal is received from the DCE.
80E0	The message was terminated because the receive buffer is full.
80E1	The message was terminated as a result of a parity error.
80E2	The message was terminated as a result of a framing error.
80E3	The message was terminated as a result of an overrun error.
80E4	The message was terminated as a result of the specified length exceeding the total buffer size.
8180	Invalid port ID value or error with MB_COMM_LOAD instruction
8186	Invalid Modbus station address
8187	Invalid pointer to MB_HOLD_REG DB: Area is too small
818C	Invalid MB_HOLD_REG pointer to M memory or DB (DB area must allow both symbolic and direct address)

Table 13- 165 MB_SLAVE execution condition codes (Modbus protocol errors) [1]

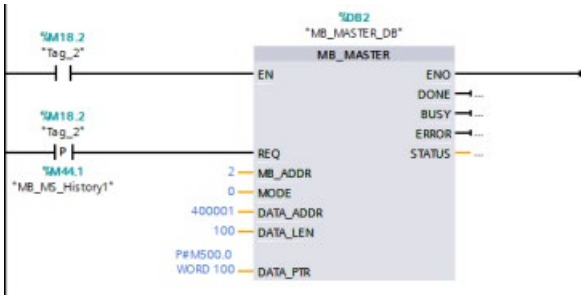
STATUS (W#16#)	Response code from slave	Modbus protocol errors
8380	No response	CRC error
8381	01	Function code not supported or not supported within broadcasts
8382	03	Data length error
8383	02	Data address error or address outside the valid range of the DATA_PTR area
8384	03	Data value error
8385	03	Data diagnostic code value not supported (function code 08)



[1] In addition to the MB_SLAVE errors listed above, errors can be returned from the underlying PtP communication instructions.

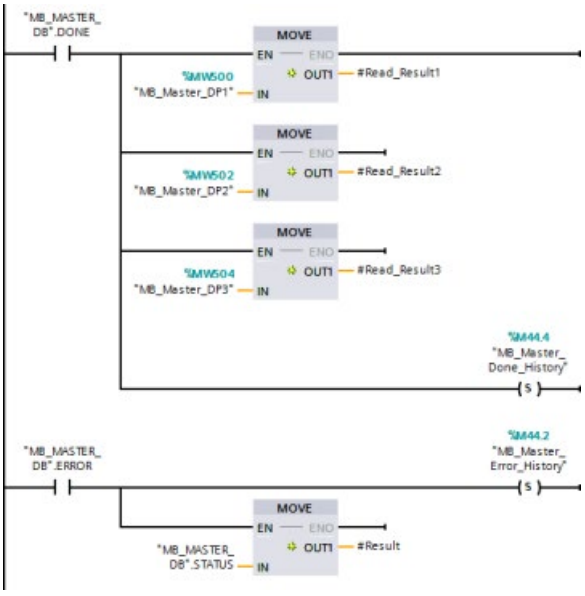
13.9.4 Legacy Modbus RTU examples

13.9.4.1 Example: Legacy Modbus RTU master program

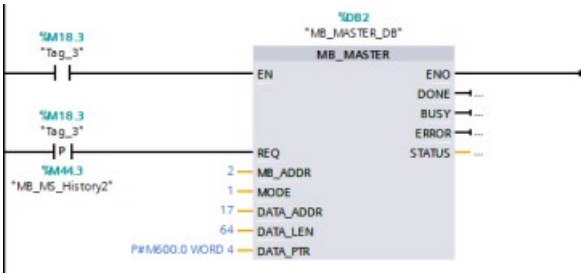


MB_COMM_LOAD is initialized during start-up by using the first scan flag. Execution of MB_COMM_LOAD in this manner should only be done when the serial port configuration will not change at runtime.

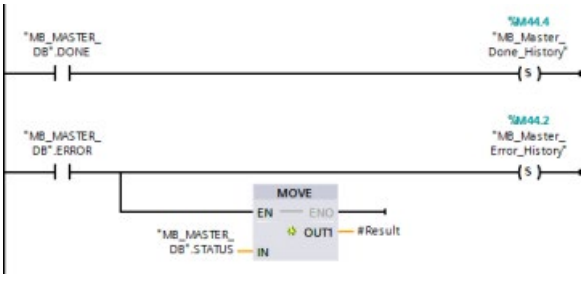
Network 1: Configure/initialize the RS485 module communications port only once during the first scan.



One MB_MASTER instruction is used in the program cycle OB to communicate with a single slave. Additional MB_MASTER instructions can be used in the program cycle OB to communicate with other slaves, or one MB_MASTER FB could be re-used to communicate with additional slaves.



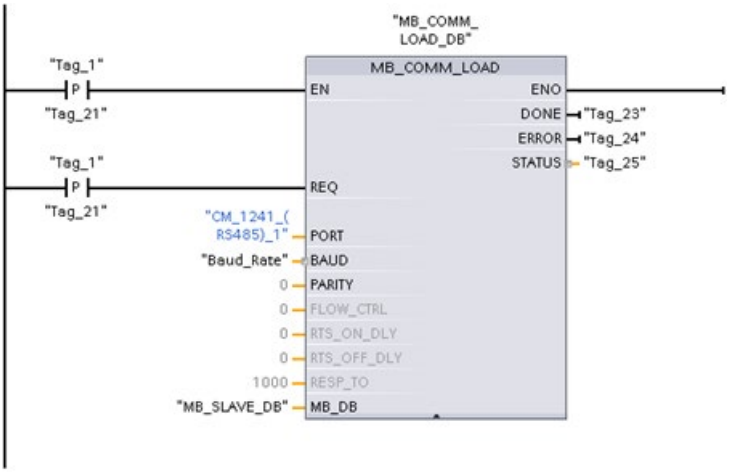
Network 2: Read 100 words of holding register data from location 400001 on slave #2 to memory location MW500-MW698.



Network 3: Move the first 3 words of the holding register data that has been read to some other location, and set a DONE history bit. This network also sets an ERROR history bit and saves the STATUS word to another location in the event of an error.

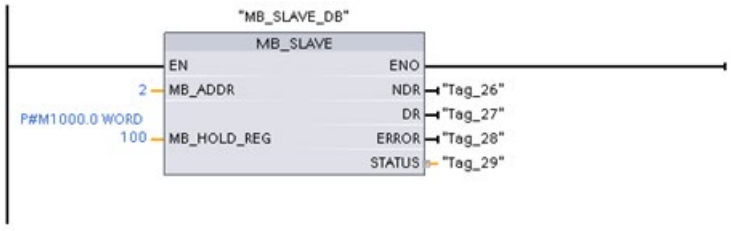
Network 4: Write 64 bits of data from MW600-MW607 to output bit locations 00017 to 00081 on slave #2.

Network 5: Set a DONE history bit when the write is complete. If an error occurs, the program sets an ERROR history bit and saves the STATUS code.



13.9.4.2 Example: Legacy Modbus RTU slave program

MB_COMM_LOAD shown below is initialized each time "Tag_1" is enabled.



Execution of MB_COMM_LOAD in this manner should only be done when the serial port configuration will change at runtime, as a result of HMI configuration.

Network 1: Initialize the RS485 module parameters each time they are changed by an HMI device.

MB_SLAVE shown below is placed in a cyclic OB that is executed every 10ms. While this does not give the absolute fastest response by the slave, it does provide good performance at 9600 baud for short messages (20 bytes or less in the request).

Network 2: Check for Modbus master requests during each scan. The Modbus holding register is configured for 100 words starting at MW1000.

13.10 Industrial Remote Communication (IRC)

13.10.1 Telecontrol CPs overview

Industrial Remote Communication provides access to widely distributed machines, plants, and applications of different sizes securely and economically. Industrial Remote Communications includes the following means of communication through CP modules:

- TeleControl: Telecontrol is the connection of process stations (Remote Terminal Units/RTUs) that are distributed over a wide geographical area to one or more central process control systems for the purpose of monitoring and control. Various different transmission components in the Remote Networks product spectrum support remote communication over a range of public and private networks. Special telecontrol protocols perform event-driven or cyclic exchange of process data, which permits efficient control of the overall process.
- TeleService: Teleservice involves data exchange with distant technical systems (machines, plants, computers, etc.) for the purpose of error detection, diagnostics, maintenance, repair or optimization.
- Additional applications for remote communication, for example surveillance, smart grid applications, and condition monitoring.

TeleControl CPs for the S7-1200

For TeleControl applications, the following communications processors, many of which also provide access to the S7-1200 Web server (Page 990), are available:

- **CP 1243-1:**
  - Article number: 6GK7 243-1BX30-0XE0
  - Communications processor for connecting the SIMATIC S7-1200 using the public infrastructure (for example, DSL) to a control center with TeleControl Server Basic (TCSB version V3)
  - With the help of VPN technology and the firewall, the CP allows protected access to the S7-1200.
  - You can use the CP as an additional Ethernet interface of the CPU for S7 communication.
  - You communicate between the CP and CPU using configurable data points that access PLC tags.
- **CP 1243-1 DNP3:**
  - Article number: 6GK7 243-1JX30-0XE0
  - Communications processor for connecting the SIMATIC S7-1200 to control centers using the DNP3 protocol
  - You communicate between the CP and CPU using configurable data points that access PLC tags.

- **CP 1243-1 IEC:**
  - Article number: 6GK7 243-1PX30-0XE0
  - Communications processor for connecting SIMATIC S7-1200 to control centers using the IEC 60870-5 protocol
  - You communicate between the CP and CPU using configurable data points that access PLC tags.
- **CP 1243-1 PCC:**
  - Article number: 6GK7 243-1HX30-0XE0
  - Communications processor for connecting SIMATIC S7-1200 to control centers using Plant Cloud Communication (PCC)
  - You communicate between the CP and CPU using configurable data points that access PLC tags.
- **CP 1242-7:**
  - Article number: 6GK7 242-7KX31-0XE0
  - Communications processor for connecting the SIMATIC S7-1200 to a control center with TeleControl Server Basic using mobile wireless (GPRS) and the public infrastructure (DSL)
- **CP 1242-7 GPRS V2:**
  - Article number: 6GK7 242-7KX31-0XE0
  - Communications processor for connecting the SIMATIC S7-1200 to a control center with TeleControl Server Basic (TCSB version v3) using mobile wireless (GPRS) and the public infrastructure (DSL)
  - With the help of VPN technology and the firewall, the CP allows protected access to the S7-1200.
  - You can use the CP as an additional Ethernet interface of the CPU for S7 communication.
  - You communicate between the CP and CPU using configurable data points that access PLC tags.

- **CP 1243-7 LTE-xx:**
  - Communications processor for connecting the SIMATIC S7-1200 to a control center with TeleControl Server Basic (TCSB version v3) using mobile wireless (GPRS) and the public infrastructure (DSL)
  - Support of the following mobile wireless specifications: GSM/GPRS, UMTS (G3), LTE
  - To cover countries with different mobile wireless specifications, the CP is available in two variants:

    - CP 1243-7 LTE-US:

     - North American standard

     - Article number: 6GK7 243-7SX30-0XE0

    - CP 1243-7 LTE-EU:

     - Western European standard

     - Article number: 6GK7 243-7KX30-0XE0
  - With the help of VPN technology and the firewall, the CP allows protected access to the S7-1200.
  - You can use the CP as an additional Ethernet interface of the CPU for S7 communication.
  - You communicate between the CP and CPU using configurable data points that access PLC tags.
- **CP 1243-8 IRC:**
  - Article number: 6GK7 242-8RX30-0XE0
  - Communications processor for connecting the SIMATIC S7-1200 to an ST7 network, data point configuration, and VPN

Note

You must have TeleControl Server Basic software for TeleControl applications for CPs other than the CP 1243-1.

Secure communication

The well-proven SINAUT ST7 protocol or the standardized DNP3 or IEC 60870-5 protocol adds security to Industrial Remote Communication (http://w3app.siemens.com/mcms/infocenter/dokumentencenter/sc/ic/InfocenterLanguagePacks/Netzwerksicherheit/6ZB5530-1AP02-0BA4_BR_Network_Security_en_112015.pdf). The TeleControl solution provides comprehensive measures to prevent data falsification and loss. Each transmission module has a large memory for several thousand data frames, which offers the ability to bridge downtimes in the transmission link. Dedicated VPN solutions protect special IP-based networks.

The CP 1243-1 communications processor securely connects the SIMATIC S7-1200 controller to Ethernet networks. With its integrated firewall (Stateful Inspection) and VPN protocol (IPsec) security functions, the communications processor helps protect S7-1200 stations and lower-level networks against unauthorized access and helps protect data transmission against manipulation and espionage by encryption. Furthermore, the CP can also be used for integrating the S7-1200 station into the TeleControl Server Basic control center software using IP-based remote networks.

13.10.2 Connection to a GSM network

IP-based WAN communication via GPRS

Using the CP 1242-7 communications processor, the S7-1200 can be connected to GSM networks. The CP 1242-7 allows WAN communication from remote stations with a control center and inter-station communication.

Inter-station communication is possible only via a GSM network. For communication between a remote station and a control room, the control center must have a PC with Internet access.

The CP 1242-7 supports the following services for communication via the GSM network:

- GPRS (General Packet Radio Service)

  The packet-oriented service for data transmission "GPRS" is handled via the GSM network.

- SMS (Short Message Service)

  The CP 1242-7 can receive and send SMS messages. The communications partner can be a mobile phone or an S7-1200.

The CP 1242-7 is suitable for use in industry worldwide and supports the following frequency bands:

- 850 MHz
- 900 MHz
- 1,800 MHz
- 1,900 MHz

Requirements

The equipment used in the stations or the control center depends on the particular application.

- For communication with or via a central control room, the control center requires a PC with Internet access.
- Apart from the station equipment, a remote S7-1200 station with a CP 1242-7 must meet the following requirements to be able to communicate via the GSM network:
  - A contract with a suitable GSM network provider

    If GPRS is used, the contract must allow the use of the GPRS service.

    If there is to be direct communication between stations only via the GSM network, the GSM network provider must assign a fixed IP address to the CPs. In this case, communication between stations is not via the control center.
  - The SIM card belonging to the contract

    The SIM card is inserted in the CP 1242-7.
  - Local availability of a GSM network in the range of the station

13.10.3 Applications of the CP 1242-7

The CP 1242-7 can be used for the following applications:

Telecontrol applications

- Sending messages by SMS

  Via the CP 1242-7, the CPU of a remote S7-1200 station can receive SMS messages from the GSM network or send messages by SMS to a configured mobile phone or an S7-1200.

- Communication with a control center

  Remote S7-1200 stations communicate via the GSM network and the Internet with a telecontrol server in the master station. For data transfer using GPRS, the "TELECONTROL SERVER BASIC" application is installed on the telecontrol server in the master station. The telecontrol server communicates with a higher-level central control system using the integrated OPC server function.

- Communication between S7-1200 stations via a GSM network

  Communication between remote stations with a CP 1242-7 can be handled in two different ways:

  – Inter-station communication via a master station

    In this configuration, a permanent secure connection between S7-1200 stations that communicate with each other and the telecontrol server is established in the master station. Communication between the stations is via the telecontrol server. The CP 1242-7 operates in "Telecontrol" mode.

  – Direct communication between the stations

    For direct communication between stations without the detour via the master station, SIM cards with a fixed IP address are used that allow the stations to address each other directly. The possible communications services and security functions (for example VPN) depend on what is offered by the network provider. The CP 1242-7 operates in "GPRS direct" mode.

TeleService via GPRS

A TeleService connection can be established between an engineering station with STEP 7 and a remote S7-1200 station with a CP 1242-7 via the GSM network and the Internet. The connection runs from the engineering station via a telecontrol server or a TeleService gateway that acts as an intermediary forwarding frames and establishing the authorization. These PCs use the functions of the "TELECONTROL SERVER BASIC" application.

You can use the TeleService connection for the following purposes:

- Downloading configuration or program data from the STEP 7 project to the station
- Querying diagnostics data on the station

13.10.4 Other properties of the CP 1242-7

Other services and functions of the CP 1242-7

- Time-of-day synchronization of the CP via the Internet

  You can set the time on the CP as follows:

  – In "Telecontrol" mode, the time of day is transferred by the telecontrol server. The CP uses this to set its time.

  – In "GPRS direct" mode, the CP can request the time using SNTP.

  To synchronize the CPU time, you can read out the current time from the CP using a block.
- Interim buffering of messages to be sent if there are connection problems
- Increased availability thanks to the option of connecting to a substitute telecontrol server
- Logging the volume of data

  The volumes of data transferred are logged and can be evaluated for specific purposes.

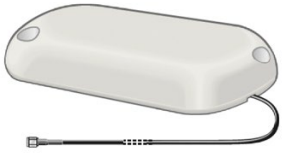
13.10.5 Further information

The CP manuals, associated documentation, and product information documents provide detailed information:

- CP 1242-7 (http://support.automation.siemens.com/WW/view/en/45605894)
- CP 1243-7 LTE (https://support.industry.siemens.com/cs/ww/en/ps/15924)
- CP 1243-1 DNP3 (https://support.industry.siemens.com/cs/ww/en/ps/15938)
- CP 1243-8 IRC (https://support.industry.siemens.com/cs/ww/en/ps/21162)
- CP 1243-1 IEC (https://support.industry.siemens.com/cs/ww/en/ps/15942)
- Firmware updates as available (https://support.industry.siemens.com/cs/ww/en/view/109482530)

13.10.6 Accessories

The ANT794-4MR GSM/GPRS antenna

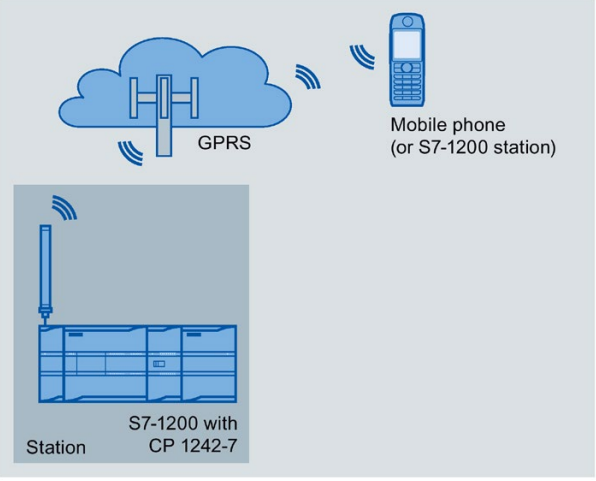


The following antennas are available for use in GSM/GPRS networks and can be installed both indoors and outdoors:

- Quadband antenna ANT794-4MR (http://support.automation.siemens.com/WW/view/en/23119005)

Short name	Order no.	Explanation
ANT794-4MR	6NH9 860-1AA00	Quadband antenna (900, 1800/1900 MHz, UMTS); weatherproof for indoor and outdoor areas; 5 m connecting cable connected permanently to the antenna; SMA connector, including installation bracket, screws, wall plugs

- Flat antenna ANT794-3M



Short name	Order no.	Explanation
ANT794-3M	6NH9 870-1AA00	Flat antenna (900, 1800/1900 MHz); weatherproof for indoor and outdoor areas; 1.2 m connecting cable connected permanently to the antenna; SMA connector, including adhesive pad, screws mounting possible

The antennas must be ordered separately.

13.10.7 Configuration examples for telecontrol

Below, you will find several configuration examples for stations with a CP 1242-7.

Sending messages by SMS

A SIMATIC S7-1200 with a CP 1242-7 can send messages by SMS to a mobile phone or a configured S7-1200 station.

Telecontrol by a control center

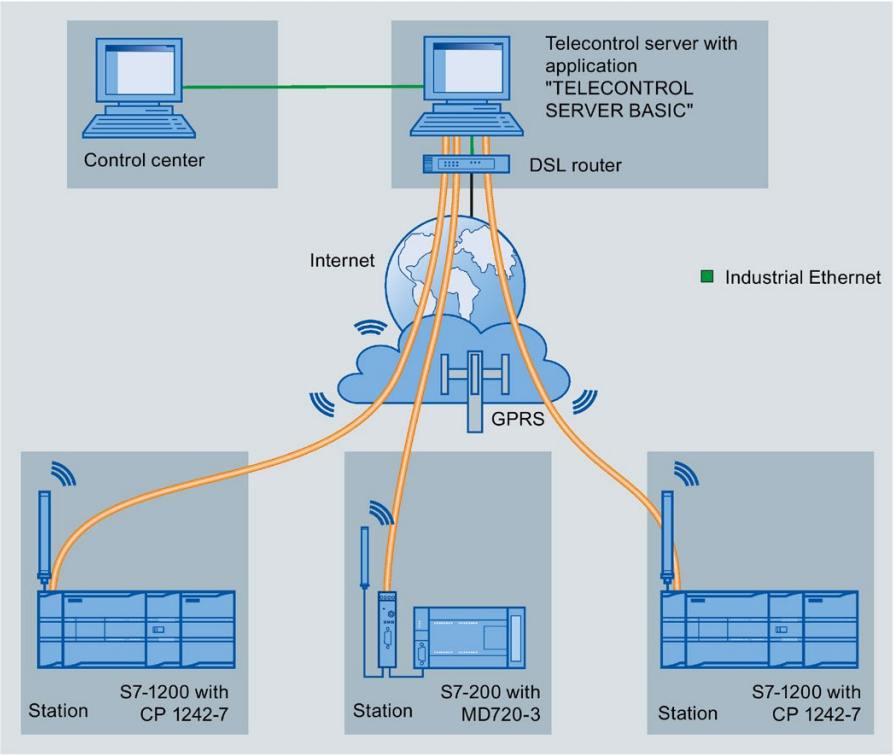


Figure 13-1 Communication between S7-1200 stations and a control center

In telecontrol applications, SIMATIC S7-1200 stations with a CP 1242-7 communicate with a control center via the GSM network and the Internet. The "TELECONTROL SERVER BASIC" (TCSB) application is installed on the telecontrol server in the master station. This results in the following use cases:

- Telecontrol communication between station and control center

  In this use case, data from the field is sent by the stations to the telecontrol server in the master station via the GSM network and Internet. The telecontrol server is used to monitor remote stations.

- Communication between a station and a control room with OPC client

  As in the first case, the stations communicate with the telecontrol server. Using its integrated OPC server, the telecontrol server exchanges data with the OPC client of the control room.

  The OPC client and telecontrol server can be located on a single computer, for example when TCSB is installed on a control center computer with WinCC.

- Inter-station communication via a control center

  Inter-station communication is possible with S7 stations equipped with a CP 1242-7.

  To allow inter-station communication, the telecontrol server forwards the messages of the sending station to the receiving station.

Direct communication between stations

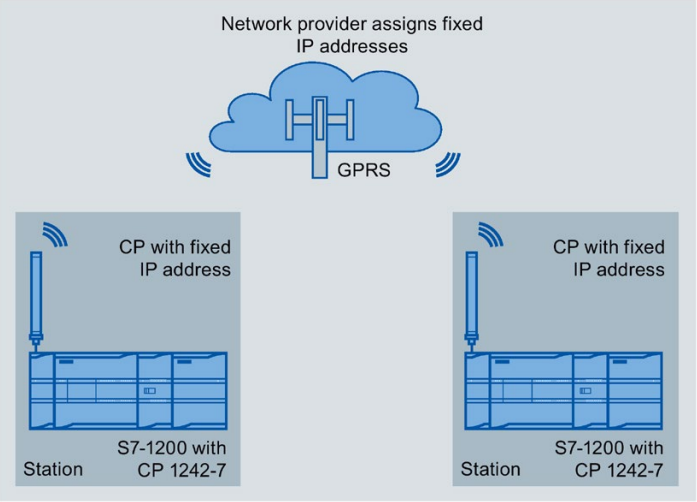

Figure 13-2 Direct communication between two S7-1200 stations

In this configuration, two SIMATIC S7-1200 stations communicate directly with each other using the CP 1242-7 via the GSM network. Each CP 1242-7 has a fixed IP address. The relevant service of the GSM network provider must allow this.

TeleService via GPRS

In TeleService via GPRS, an engineering station on which STEP 7 is installed communicates via the GSM network and the Internet with the CP 1242-7 in the S7-1200.

Since a firewall is normally closed for connection requests from the outside, a switching station between the remote station and the engineering station is required. This switching station can be a telecontrol server or, if there is no telecontrol server in the configuration, a TeleService gateway.

TeleService with telecontrol server

The connection runs via the telecontrol server.

- The engineering station and telecontrol server are connected via the Intranet (LAN) or Internet.
- The telecontrol server and remote station are connected via the Internet and via the GSM network.

The engineering station and telecontrol server can also be the same computer; in other words, STEP 7 and TCSB are installed on the same computer.

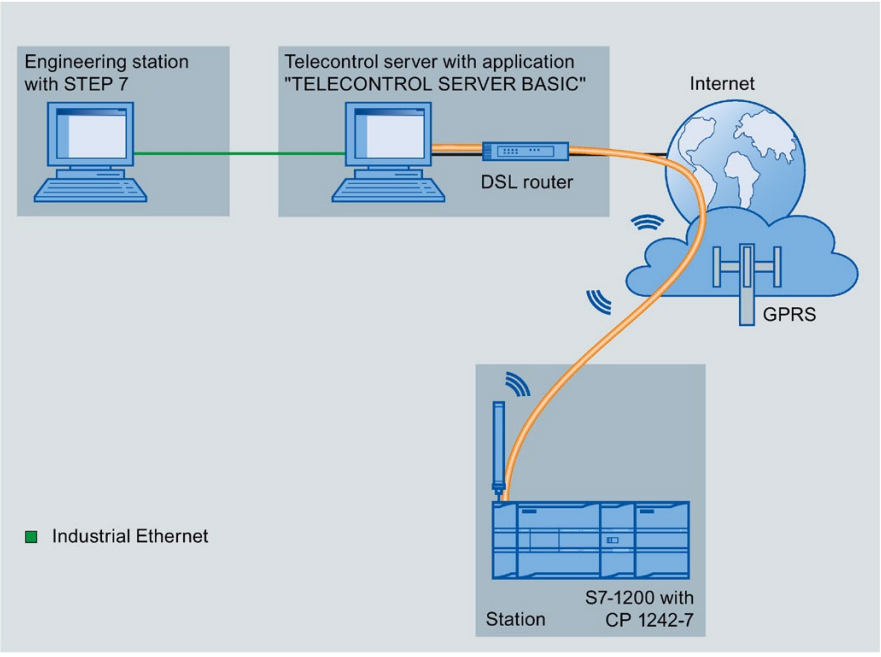

Figure 13-3 TeleService via GPRS in a configuration with telecontrol server

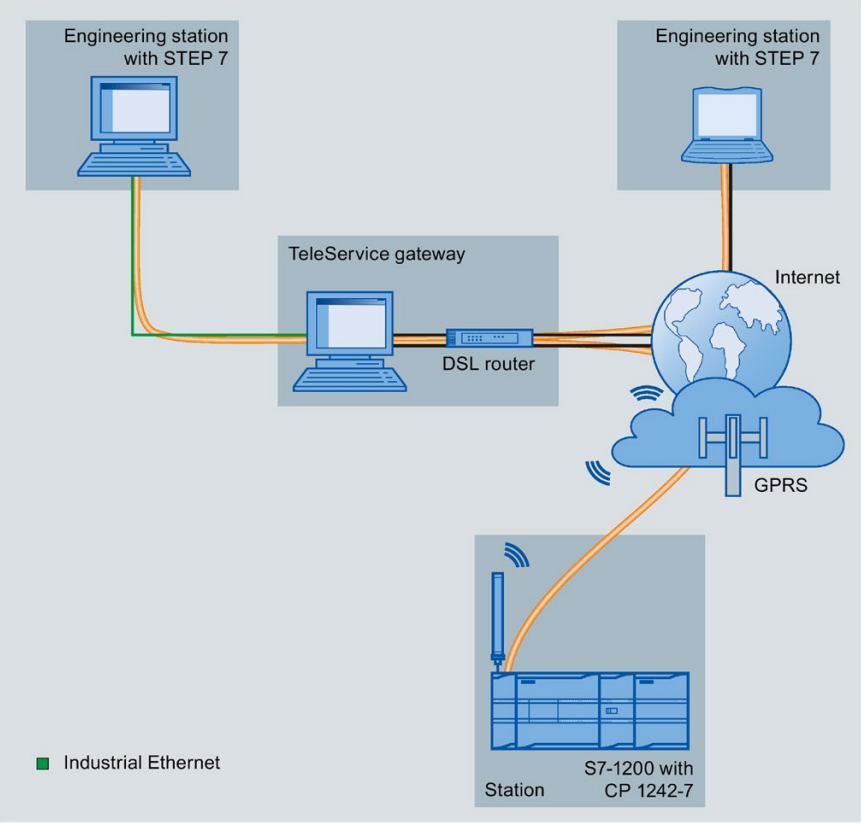
TeleService without a telecontrol server

The connection runs via the TeleService gateway.

The connection between the engineering station and the TeleService gateway can be local via a LAN or via the Internet.



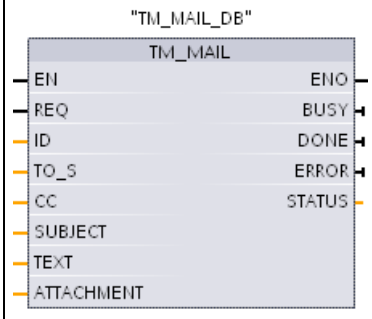


Figure 13-4 TeleService via GPRS in a configuration with TeleService gateway

TeleService communication (SMTP email) 14

14.1 TM_Mail (Send email) instruction

Table 14- 1 TM_MAIL instruction

LAD / FBD	SCL	Description
	**"TM_MAIL_DB"(** **REQ:=_bool_in_,** **ID:=_int_in_,** **TO_S:=_string_in_,** **CC:=_string_in_,** **SUBJECT:=_string_in_,** **TEXT:= _string_in_,** **ATTACHMENT:=_variant_in_,** **BUSY=>_bool_out_,** **DONE=>_bool_out_,** **ERROR=>_bool_out_,** **STATUS=>_word_out_,);**	The TM_MAIL instruction sends an email message using the SMTP (Simple Mail Transfer Protocol) over TCP/IP via the CPU Industrial Ethernet connection. Where Ethernet-based Internet connectivity is not available, an optional Teleservice adapter can be used for connection with telephone land lines. TM_MAIL executes asynchronously and the job extends over multiple TM_MAIL calls. When you call TM_MAIL, you must assign an instance DB. **The instance DB retentive attribute must not be set**. This ensures that the instance DB is initialized in the transition of the CPU from STOP to RUN and that a new TM_MAIL operation can be triggered.

[1] STEP 7 automatically creates the instance DB when you insert the instruction.

You start sending an email with a positive edge change from 0 to 1, at input parameter REQ. The following table shows the relationship between BUSY, DONE and ERROR. You can monitor the progress of TM_MAIL execution and detect completion, by evaluating these parameters in successive calls.

The output parameters DONE, ERROR, STATUS, and SFC_STATUS are valid for only one cycle, when the state of the output parameter BUSY changes from 1 to 0. Your program logic must save temporary output state values, so you can detect state changes in subsequent program execution cycles.

Note

TM_MAIL sends a mail message over TCP/IP using the Ethernet interface of the CPU. To send a mail message over a CP interface (with or without SSL) use the instruction TMAIL_C (Send an email using the Ethernet interface of the CPU) instruction (Page 863).

Table 14- 2 Interaction of the Done, Busy and Error parameters

DONE	BUSY	ERROR	Description
Irrelevant	1	Irrelevant	Job is in progress.
1	0	0	The job was completed successfully.
0	0	1	The job was terminated with an error. For the cause of the error, refer to the STATUS parameter.
0	0	0	No job in progress

If the CPU is changed to STOP mode while TM_MAIL is active, then the communication connection to the email server is terminated. The communication connection to the email server is also lost if problems occur in CPU communication on the Industrial Ethernet bus. In these cases, the send process is suspended and the email does not reach the recipient.

NOTICE

Modifying user programs

Deletion and replacement of program blocks, the calls to TM_MAIL, or calls to the instance DBs of TM_MAIL can break the linking of program blocks. If you fail to maintain linked program blocks, then the TPC/IP communication functions can enter an undefined state, possibly resulting in property damage. After transferring a modified program block, you would have to perform a CPU restart (warm) or cold start.

To avoid breaking the linking of program blocks, only change the parts of your user program that directly affect the TM_MAIL calls in the following cases:

- The CPU in the STOP mode
- No email is sent (REQ and BUSY = 0)

Data consistency

The input parameter ADDR_MAIL_SERVER is read when the operation is started. A new value does not take effect until the current operation is complete and a new TM_MAIL operation is initiated.

In contrast, the parameters WATCH_DOG_TIME, TO_S, CC, FROM, SUBJECT, TEXT, ATTACHMENT, USERNAME and PASSWORD are read during the execution of TM_MAIL and may be changed only when the job is finished (BUSY = 0)

Dial-up connection: Configuring the TS adapter IE parameters

You must configure the Teleservice adapter IE parameters for outgoing calls to connect with the dial-up server of your Internet Service Provider. If you set the call "on demand" attribute, then the connection is established only when an e-mail will be sent. For an analog modem connection, more time is required for the connection process (approx. a minute longer). You must include the extra time, in the WATCH_DOG_TIME value.

Table 14- 3 Data types for the parameters

Parameter and type		Data types	Description
REQ	IN	Bool	A low to high (positive edge) signal starts the operation.
ID	IN	Int	Connection identifier: See the ID parameter of the instructions TCON, TDISCON, TSEND and TRCV. A number that is not used for any additional instances of this instruction in the user program must be used.
TO_S	IN	String	Recipient addresses: STRING data with a maximum length of 240 characters
CC	IN	String	CC copy to recipient addresses (optional): STRING data with a maximum length of 240 characters
SUBJECT	IN	String	Subject name of the email: STRING data with a maximum length 240 characters.
TEXT	IN	String	Text message of the email (optional): STRING data with a maximum length of 240 characters. If this parameter is an empty string, then the email will be sent without message text.
ATTACHMENT	IN	Variant	Pointer to email attachment data: Byte, word, or double word data with a maximum length of 65534 bytes. If no value is assigned, then the email sent without an attachment.
DONE	OUT	Bool	• 0 - Job not yet started or still executing. • 1 - Job was executed error-free.
BUSY	OUT	Bool	• 0 - No operation in progress • 1- Operation in progress
ERROR	OUT	Bool	The ERROR bit =1 for one scan, after the last request was terminated with an error. The error code value at the STATUS output is valid only during the single scan where ERROR = 1.
STATUS	OUT	Word	Return value or error information of the TM_MAIL instruction.

Parameter and type		Data types	Description
ADDR_MAIL_SERVER	[1] Static	DWord	IP address of the mail server: You must assign each IP address fragment as an octet of two 4-bit hexadecimal characters. If the IP address fragment = decimal value 10 which equals hexadecimal value A, then you must enter "0A" for that octet. For example: IP address = 192.168.0.10 ADDR_MAIL_SERVER = DW#16#C0A8000A, where: • 192 = 16#C0, • 168 =16#A8 • 0 = 16#00 • 10 = 16#0A
WATCH_DOG_TIME	[1] Static	Time	The maximum time allowed for TM_MAIL to complete the entire SMTP process, from the initiation of the connection to the SMTP to the end of the SMTP transmission. If this time is exceeded, then TM_MAIL execution ends with an error. The actual time delay until TM_MAIL ends and the error is issued may exceed the WATCH_DOG_TIME, because of the additional time required for the disconnect operation. At first you should set a time of 2 minutes. This time can be much smaller for an ISDN phone connection.
USERNAME	[1] Static	String	Mail account user name: STRING data with a maximum length 180 characters.
PASSWORD	[1] Static	String	Mail server password: STRING data with a maximum length 180 characters.
FROM	[1] Static	String	Sender address: STRING with a maximum length of 240 characters
SFC_STATUS	[1] Static	Word	Execution condition code of the called communication blocks

[1] The values of these parameters are not modified at every call of TM_MAIL. The values are assigned in the TM_MAIL instance data block and are only referenced once, on the first call of TM_MAIL.

SMTP authentication

TM_MAIL supports the SMTP AUTH LOGIN authentication method. For information on this authentication method, please refer to the manual of the mail server or the website of your internet service provider.

The AUTH LOGIN authentication method uses the TM_MAIL USERNAME and PASSWORD parameters to connect with the mail server. The user name and password must be previously set up on an email account at an email server.

If no value is assigned for the USERNAME parameter, then the AUTH LOGIN authentication method is not used and the email is sent without authentication.

TO_S:, CC:, and FROM: parameters

The parameters TO_S:, CC: and FROM: are strings, as shown in the following examples:

TO: <wenna@mydomain.com>, <ruby@mydomain.com>,

CC: <admin@mydomain.com>, <judy@mydomain.com>,

FROM: <admin@mydomain.com>

The following rules must be used when entering these character strings:

- The characters "TO:", "CC:" and "FROM:" must be entered, including the colon character.
- A space character and an opening angle bracket "<" must precede each address. For example, there must be a space character between "TO:" and <email address>.
- A closing angle bracket ">" must be entered after each address.
- A comma character "," must be entered after each email address for the TO_S: and CC: addresses. For example, the comma after the single email address is required in "TO: <email address>,".
- Only one email address may be used for the FROM: entry, with no comma at the end.

Because of run-time mode and memory usage, a syntax check is not performed on the TM_MAIL TO_S:, CC: and FROM: data. If the format rules above are not followed exactly. The SMTP email server transaction will fail.

STATUS and SFC_STATUS parameters

The execution condition codes returned by TM_MAIL can be classified as follows:

- W#16#0000: Operation of TM_MAIL was completed successfully
- W#16#7xxx: Status of TM_MAIL operation
- W#16#8xxx: An error in an internal call to a communication device or the mail server

The following table shows the execution condition codes of TM_MAIL with the exception of the error codes from internally called communication modules.

Note

Email server requirements

TM_MAIL can only communicate with an email server using SMTP via port 25. The assigned port number cannot be changed.

Most IT departments and external email servers now block port 25 to prevent a PC infected with a virus from becoming a rogue email generator.

You can connect to an internal mail server via SMTP and let the internal server manage the current security enhancements that are required to relay email through the Internet to an external mail server.

Example: Internal email server configuration

If you use Microsoft Exchange as an internal mail server, then you can configure the server to allow SMTP access from the IP address assigned the S7-1200 PLC. Configure the Exchange management console: Server configuration > Hub transport > Receive connectors > IP relay. On the Network tab, there is a box named "Receive mail from remote servers that have these IP addresses". This is where you put the IP address of the PLC that is executing the TM_MAIL instruction. No authentication is required for this type of connection with an internal Microsoft Exchange server.

Email server configuration

TM_MAIL can only use an email server that allows port 25 communication, SMTP, and AUTH LOGIN authentication (optional).

Configure a compatible email server account to accept remote SMTP log in. Then edit the instance DB for TM_MAIL to put in the TM_MAIL USERNAME and PASSWORD character strings that are used to authenticate the connection with your email account.

Table 14- 4 Condition codes

STATUS (W#16#...):	SFC_STATUS (W#16#...):	Description
0000	-	The TM_MAIL operation completed without error. This zero STATUS code does not guarantee that an email was actually sent (See the first item in the note following this table).
7001	-	TM_MAIL is active (BUSY = 1).
7002	7002	TM_MAIL is active (BUSY = 1).
8xxx	xxxx	The TM_MAIL operation was completed with an error in the internal communication instruction calls. For more information about the SFC_STATUS parameter, see the descriptions of the STATUS parameter of the underlying PROFINET open user communication instructions.
8010	xxxx	Failed to connect: For more information about the SFC_STATUS parameter, see the STATUS parameter of the TCON instruction.
8011	xxxx	Error sending data: For more information about SFC_STATUS parameter, see the STATUS parameter of the TSEND instruction.
8012	xxxx	Error while receiving data: For more information about the SFC_STATUS parameter, see the STATUS parameter descriptions of the TRCV instruction.
8013	xxxx	Failed to connect: For more information for evaluating the SFC_STATUS parameter, see the STATUS parameter descriptions of the TCON and TDISCON instructions.
8014	-	Failed to connect: You may have entered an incorrect mail server IP address (ADDR_MAIL_SERVER) or too little time (WATCH_DOG_TIME) for the connection. It is also possible that the CPU has no connection to the network or the CPU configuration is incorrect.
8015	-	Invalid pointer for ATTACHMENT parameter: Use a variant pointer with a data type and length assignment. For example, "P#DB.DBX0.0" is incorrect and "P#DB.DBX0.0 byte 256" is correct.
82xx, 84xx, 85xx	-	The error message comes from the mail server and corresponds to error number "8" of the SMTP protocol. See the second item in the note following this table.
8450	-	Operation does not run: Mailbox is not available; try again later.

STATUS (W#16#...):	SFC_STATUS (W#16#...):	Description
8451	-	Operation aborted: Local error in processing, try again later.
8500	-	Command syntax error: The cause may be that the email server does not support the LOGIN authentication process. Check the parameters of TM_MAIL. Try to send an email without authentication. Try replacing the parameter USERNAME with an empty string.
8501	-	Syntax error: Incorrect parameter or argument; you may have typed an incorrect address in the TO_S or CC parameters.
8502	-	Command is unknown or not implemented: Check your entries, especially the parameter FROM. Perhaps this is incomplete and you have omitted the "@" or "." characters.
8535	-	SMTP authentication is incomplete. You may have entered an incorrect username or password.
8550	-	The mail server cannot be reached, or you have no access rights. You may have entered an incorrect username or password or your mail server does not support log in access. Another cause of this error could be an erroneous entry of the domain name after the "@" character in the TO_S or CC parameters.
8552	-	Operation aborted: Exceeded the allocated memory size; try again later.
8554	-	Transmission failed: Try again later.

Note

Possible unreported email transmission errors

- Incorrect entry of a recipient address does not generate a STATUS error for TM_MAIL. In this case, there is no guarantee that additional recipients (with correct email addresses), will receive the email.
- More information on SMTP error codes can be found on the internet or in the error documentation for the mail server. You can also read the last error message from the mail server. The error message is stored in buffer1parameter of the instance DB for TM_MAIL.

Online and diagnostic tools 15

15.1 Status LEDs

The CPU and the I/O modules use LEDs to provide information about either the operating state of the module or the I/O.

Status LEDs on a CPU

The CPU provides the following status indicators:

- STOP/RUN
  - Solid yellow indicates STOP mode
  - Solid green indicates RUN mode
  - Flashing (alternating green and yellow) indicates that the CPU is in the STARTUP operating state
- ERROR
  - Flashing red indicates an error, such as an internal error in the CPU, an error with the memory card, or a configuration error (mismatched modules)
  - Flashing red for three seconds indicates an error that is not ongoing. An example is if the real time clock (RTC) resets to the default time due to a power loss.
  - Defective state:

    - Solid red indicates defective hardware

    - All LEDs flash if the firmware detects a defect
- MAINT (Maintenance) flashes whenever you insert a memory card. The CPU then changes to STOP mode. After the CPU has changed to STOP mode, perform one of the following functions to initiate the evaluation of the memory card:
  - Change the CPU to RUN mode
  - Perform a memory reset (MRES)
  - Power-cycle the CPU

You can also use the LED instruction (Page 438) to determine the status of the LEDs.

Table 15- 1 Status LEDs for a CPU

Description	STOP/RUN Yellow / Green	ERROR Red	MAINT Yellow
Power is off	Off	Off	Off
Startup, self-test, or firmware update	Flashing (alternating yellow and green)	-	Off
Stop mode	On (yellow)	-	-
Run mode	On (green)	-	-
Remove the memory card	On (yellow)	-	Flashing
Error	On (either yellow or green)	Flashing	-
Maintenance requested • Forced I/O • Battery replacement required (if battery board installed)	On (either yellow or green)	-	On
Defective hardware	On (yellow)	On	Off
LED test or defective CPU firmware	Flashing (alternating yellow and green)	Flashing	Flashing
Unknown or incompatible version of CPU configuration	On (yellow)	Flashing	Flashing

Note

"Unknown or incompatible version of CPU configuration" error

Attempting to download an S7-1200 V3.0 program to an S7-1200 V4.0 CPU causes a CPU error, and the CPU displays a corresponding error message in the diagnostic buffer. If you reached this state by using an invalid version program transfer card (Page 138), then remove the card, perform a STOP to RUN transition, a memory reset (MRES) or cycle power. If you reach this state by an invalid program download, reset the CPU to factory settings (Page 1303). After you recover the CPU from the error condition, you can download a valid V4.0 CPU program.

The CPU also provides two LEDs that indicate the status of the PROFINET communications. Open the bottom terminal block cover to view the PROFINET LEDs.

- Link (green) turns on to indicate a successful connection
- Rx/Tx (yellow) turns on to indicate transmission activity

The CPU and each digital signal module (SM) provide an I/O Channel LED for each of the digital inputs and outputs. The I/O Channel (green) turns on or off to indicate the state of the individual input or output.

S7-1200 behavior following a fatal error

If the CPU firmware detects a fatal error it attempts a defect-mode restart, and if successful, signals the defective mode by continually flashing the STOP/RUN, ERROR and MAINT LEDs. The user program and hardware configuration are not loaded following the defect-mode restart.

If the CPU successfully completes the defect-mode restart, the CPU performs these actions:

- Sets the CPU and signal board outputs are to 0
- Sets the outputs of central rack signal modules and distributed I/O to the selection for "Reaction to CPU STOP" in the device configuration of the digital outputs of the module

If the defect-mode restart fails, (for example, due to a hardware fault), the STOP and ERROR LEDs are ON and the MAINT LED is OFF.

⚠ WARNING

Operation in defect state cannot be guaranteed

Control devices can fail in an unsafe condition, resulting in unexpected operation of controlled equipment. Such unexpected operations could result in death or serious injury to personnel, and/or damage to equipment.

Use an emergency stop function, electromechanical overrides or other redundant safeguards that are independent of the PLC.

Status LEDs on an SM

In addition, each digital SM provides a DIAG LED that indicates the status of the module:

- Green indicates that the module is operational
- Red indicates that the module is defective or non-operational

Each analog SM provides an I/O Channel LED for each of the analog inputs and outputs.

- Green indicates that the channel has been configured and is active
- Red indicates an error condition of the individual analog input or output

In addition, each analog SM provides a DIAG LED that indicates the status of the module:

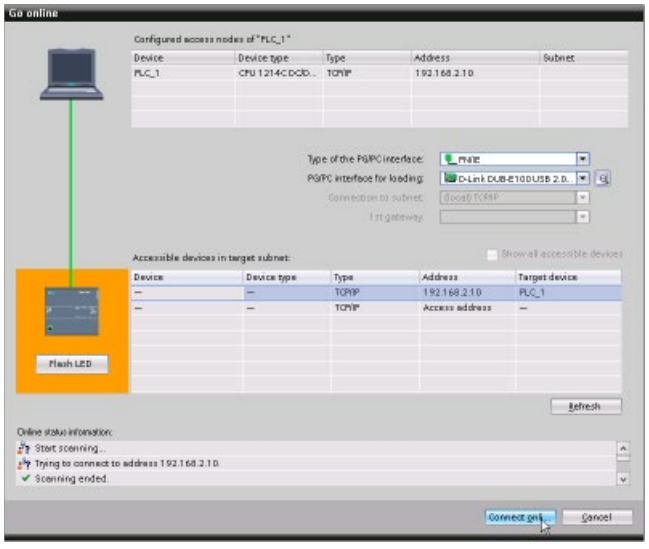
- Green indicates that the module is operational
- Red indicates that the module is defective or non-operational

The SM detects the presence or absence of power to the module (field-side power, if required).

Table 15- 2 Status LEDs for a signal module (SM)

Description	DIAG (Red / Green)	I/O Channel (Red / Green)
Field-side power is off *	Flashing red	Flashing red
Not configured or update in progress	Flashing green	Off
Module configured with no errors	On (green)	On (green)
Error condition	Flashing red	-
I/O error (with diagnostics enabled)	-	Flashing red
I/O error (with diagnostics disabled)	-	On (green)

* Status is only supported on analog signal modules.



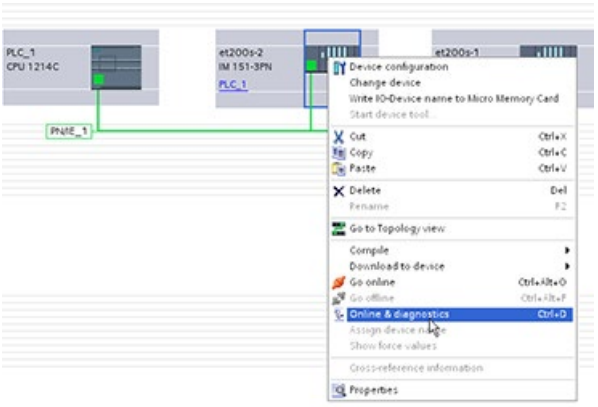
15.2 Going online and connecting to a CPU

You must establish an online connection between the programming device and CPU for loading programs and project engineering data as well as for activities such as the following:

- Testing user programs
- Displaying and changing the operating mode of the CPU (Page 1306)
- Displaying and setting the date and time of day of the CPU (Page 1302)
- Displaying the module information
- Comparing and synchronizing (Page 1309) offline to online program blocks
- Uploading and downloading program blocks
- Displaying diagnostics and the diagnostics buffer (Page 1308)
- Using a watch table (Page 1315) to test the user program by monitoring and modifying values
- Using a force table to force values in the CPU (Page 1318)

To establish an online connection to a configured CPU, click the CPU from the Project Navigation tree and click the "Go online" button from the Project View:

If this is the first time to go online with this CPU, you must select the type of PG/PC interface and the specific PG/PC interface from the Go Online dialog before establishing an online connection to a CPU found on that interface.

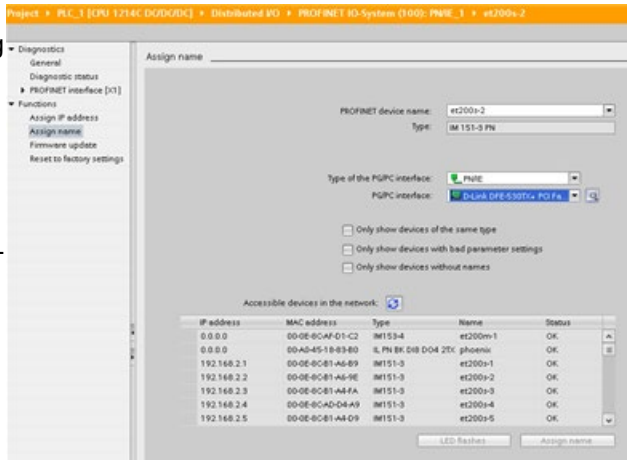


You have now connected your programming device to the CPU. The orange color frames indicate an online connection. You can now use the Online & diagnostics tools from the Project tree and the Online tools task card.

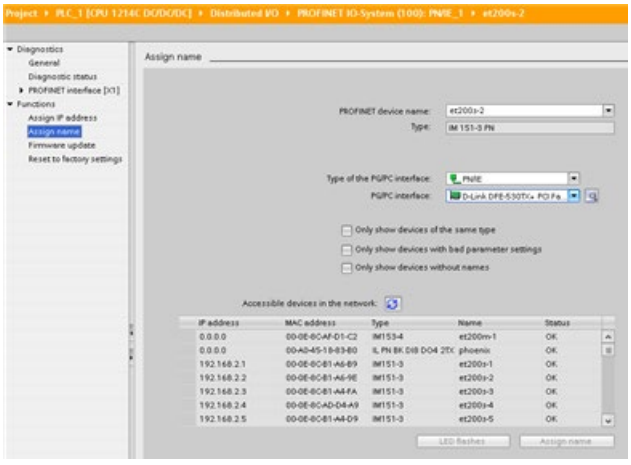
15.3 Assigning a name to a PROFINET IO device online

The devices on your PROFINET network must have an assigned name before you can connect with the CPU. Use the "Devices & networks" editor to assign names to your PROFINET devices if the devices have not already been assigned a name or if the name of the device is to be changed.

For each PROFINET IO device, you must assign the same name to that device in both the STEP 7 project and, using the "Online & diagnostics" tool, to the PROFINET IO device configuration memory (for example, an ET200 S interface module configuration memory). If a name is missing or does not match in either location, the PROFINET IO data exchange mode will not run.



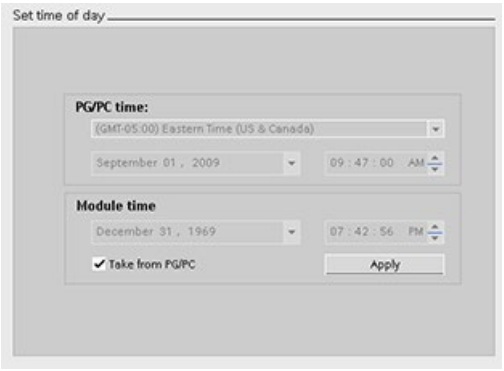
1. In the "Devices & networks" editor, right-click on the required PROFINET IO device, and select "Online & diagnostics".



2. In the "Online & diagnostics" dialog, make the following menu selections:

- "Functions"
- "Assign PROFINET device name"

Click the "Update list" button to display all of the PROFINET IO devices on the network.



3. In the list that is displayed, click the required PROFINET IO device, and click the "Assign name" button to write the name to the PROFINET IO device configuration memory.

15.4 Setting the IP address and time of day

You can set the IP address (Page 793) and time of day in the online CPU. After accessing "Online & diagnostics" from the Project tree for an online CPU, you can display or change the IP address. You can also display or set the time and date parameters of the online CPU.

Note

This feature is available only for a CPU that either has only a MAC address (has not yet been assigned an IP address) or has been reset to factory settings.

15.5 Resetting to factory settings

You can reset an S7-1200 to its original factory settings under the following conditions:

- The CPU has an online connection.
- The CPU is in STOP mode.

Note

If the CPU is in RUN mode and you start the reset operation, you can place it in STOP mode after acknowledging a confirmation prompt.

Procedure

To reset a CPU to its factory settings, follow these steps:

1. Open the Online and Diagnostics view of the CPU.
2. Select "Reset to factory settings" from the "Functions" folder.
3. Select the "Retain IP address" check box if you want to retain the IP address or the "Delete IP address" check box if you want to delete the IP address.
4. Click the "Reset" button.
5. Acknowledge the confirmation prompt with "OK".

Result

The module switches to STOP mode if necessary, and it resets the factory settings. The CPU performs the following actions:

With memory card installed in CPU	Without memory card installed in CPU
• Clears the diagnostics buffer • Resets the time of day • Restores work memory from the memory card • Sets all operand areas to configured initial values • Sets all parameters to their configured values • Retains or deletes the IP address based on the selection you made. (The MAC address is fixed and is never changed.)[1] • Deletes the control data record (Page 155), if present	• Clears the diagnostics buffer • Resets the time of day • Clears the work memory and internal load memory • Sets all operand areas to configured initial values • Sets all parameters to their configured values • Retains or deletes the IP address based on the selection you made. (The MAC address is fixed and is never changed.)[1] • Deletes the control data record, if present

[1] If you selected "Retain IP address", the CPU sets the IP address, subnet mask, and router address (if used) to the settings in your hardware configuration, unless you have modified these values from the user program or another tool, in which case the CPU restores the modified values.

15.6 Updating firmware

You can update the firmware of a connected CPU from the STEP 7 online and diagnostics tools, by one of two methods:

- Updating from the CPU in the project
- Updating from the accessible devices in the project tree

Updating the firmware of a CPU in your project

To perform a firmware update, follow these steps:

1. Open the CPU in the Project Tree that corresponds to the connected CPU.
2. Open the Online and Diagnostics view of the connected CPU.
3. Select "Firmware update" from the "Functions" folder.
4. From the "Firmware loader" section, click the Browse button and navigate to the location that contains the firmware update file. This could be a location on your hard drive to which you have downloaded an S7-1200 (http://support.automation.siemens.com/WW/view/en/34612486/133100) firmware update file from the Siemens Industry Online Support Web site (http://support.industry.siemens.com).
5. Select a file that is compatible with your module. For a selected file, the table displays the compatible modules.
6. Click the "Run update" button. Follow the dialogs, if necessary, to change the operating mode of your CPU.

STEP 7 displays progress dialogs as it loads the firmware update. When it finishes, it prompts you to start the module with the new firmware.

Note

If you do not choose to start the module with the new firmware, the previous firmware remains active until you reset the module, for example by cycling power. The new firmware becomes active only after you reset the module.

Updating the firmware from the accessible devices

To perform a firmware update for one or more accessible devices, follow these steps:

1. Open "Online access" from the project tree.
2. Open the communications interface to which your CPU is connected.
3. Double-click "Update accessible devices" and wait for STEP 7 to display the online devices.
4. Expand the CPU that you want to update and double-click "Online & diagnostics".
5. Expand "Firmware update" from the "Functions" folder. You will see the PLC as well as local modules for the PLC. From either the "PLC" or "Local modules" selection, you can proceed with updating firmware from the "Firmware loader" section as described above.

You can also perform a firmware update by one of the following methods:

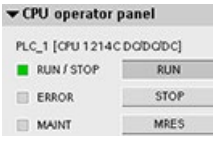
- Using a SIMATIC memory card (Page 144)
- Using the Web server "Module Information" standard Web page (Page 1002)
- Using the SIMATIC Automation Tool (https://support.industry.siemens.com/cs/ww/en/view/98161300)

15.7 Formatting a SIMATIC memory card from STEP 7

You can format the memory card in a connected CPU from the STEP 7 online and diagnostic tools. To do so, follow these steps:

1. Ensure the CPU is in STOP mode. Note that if the CPU is in RUN mode and you start a formatting operation, STEP 7 prompts you to allow STEP 7 to put the CPU in STOP mode.
2. Insert a memory card into the connected CPU.
3. Open Online & diagnostics for the connected CPU from either the CPU in the project or from the accessible devices in Online access in the project tree.
4. If the CPU is not online, select "Go online" for the connected CPU.
5. Select "Format memory card" from the "Functions" menu.
6. Click "Format".
7. Confirm the prompt with "Yes".

STEP 7 then formats the memory card and displays a message in the Info window when complete. The CPU is in STOP at the completion of the format operation with the STOP and MAINT lights blinking. You cannot go to RUN mode at this point; you must take one of the following actions:



- Remove the memory card and restart the CPU: If the internal load memory of the CPU contains a program, the CPU starts with the program.
- Restart the CPU without removing the memory card: If the internal load memory of the CPU contains a program, the CPU copies it to the memory card and starts with that program. If the internal load memory has no program, the CPU changes the memory card to a Program card (Page 141) and waits for a download.

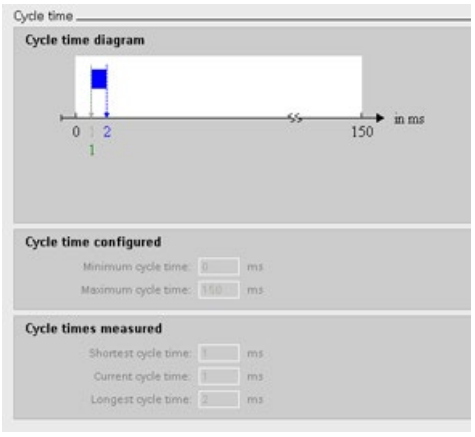
Note

Formatting a memory card has no effect on the contents of internal load memory.

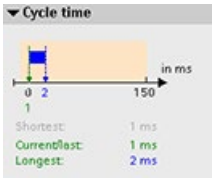
If the CPU was using internal load memory when you inserted the memory card and you did not restart the CPU between inserting the card and executing the format operation, the CPU retains the contents of internal load memory.

15.8 CPU operator panel for the online CPU

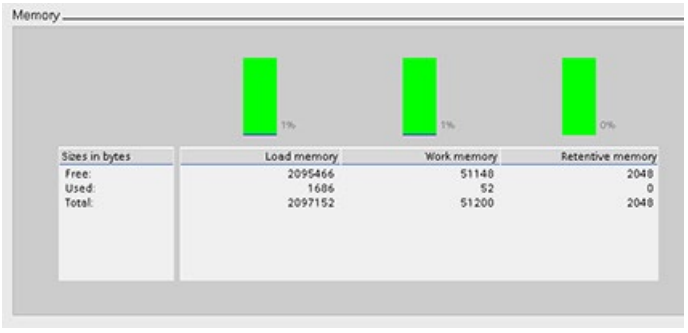
The "CPU operator panel" displays the operating mode (STOP or RUN) of the online CPU. The panel also shows whether the CPU has an error or if values are being forced.



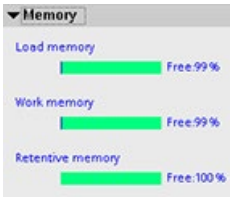
Use the CPU operating panel of the Online Tools task card to change the operating mode of an online CPU. The Online Tools task card is accessible whenever the CPU is online.



15.9 Monitoring the cycle time and memory usage

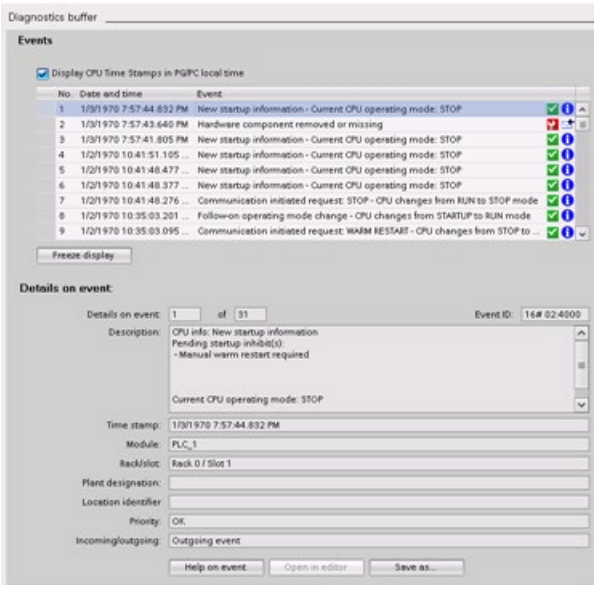


You can monitor the cycle time and memory usage of an online CPU.



After connecting to the online CPU, open the Online tools task card to view the following measurements:

- Cycle time
- Memory usage

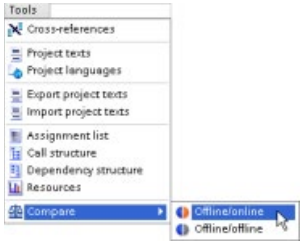


15.10 Displaying diagnostic events in the CPU

Use the diagnostics buffer to review the recent activity in the CPU. The diagnostics buffer is accessible from "Online & Diagnostics" for an online CPU in the Project tree. It contains the following entries:

- Diagnostic events
- Changes in the CPU operating mode (transitions to STOP or RUN mode)

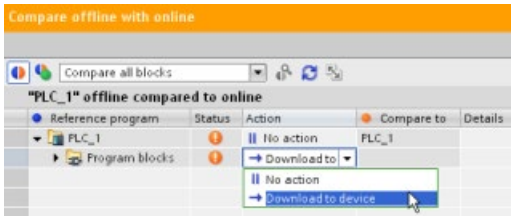
The first entry contains the latest event. Each entry in the diagnostic buffer contains the date and time the event was logged, and a description.



The maximum number of entries is dependent on the CPU. A maximum of 50 entries is supported.

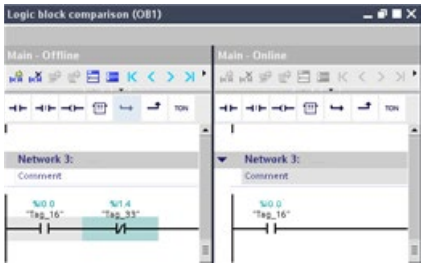
Only the 10 most recent events in the diagnostic buffer are stored permanently. Resetting the CPU to the factory settings resets the diagnostic buffer by deleting the entries.

You can also use the GET_DIAG instruction (Page 466) to collect the diagnostic information.



15.11 Comparing offline and online CPUs

You can compare the code blocks in an online CPU with the code blocks in your project. If the code blocks of your project do not match the code blocks of the online CPU, the "Compare" editor allows you to synchronize your project with the online CPU by downloading the code blocks of your project to the CPU, or by deleting blocks from the project that do not exist in the online CPU.



Select the CPU in your project.

Use the "Compare Offline/online" command to open the "Compare" editor. (Access the command either from the "Tools" menu or by right-clicking the CPU in your project.)

Click in the "Action" column for an object to select whether to delete the object, take no action, or download the object to the device.

Click the "Synchronize" button to load the code blocks.

Right-click an object in the "Compare to" column and select "Start detailed comparison" button to show the code blocks side-by-side.

The detailed comparison highlights the differences between the code blocks of online CPU and the code blocks of the CPU in your project.

Note

Read access required on protected CPU for the Offline/Online compare operations

For STEP 7 V14 or later versions, the "HMI access" security level is insufficient to perform the Offline/Online compare operations. You must have "Read access" or "Full access", to do Offline/Online compare operations.

See also Access protection for the CPU (Page 204)

15.12 Performing an online/offline topology comparison

From the topology overview in STEP 7, you can compare the configured offline topology with the actual online topology.

Procedure

To find the differences between the configured and thee actual topology, follow these steps:

1. Display the topology overview table of the topology view.
2. Click the "Offline/online comparison" button in the toolbar of the topology overview: 

Result

STEP 7 removes the "Partner station, "Partner interface" and "Cable data" columns in the topology overview table and inserts comparison columns for "Status", and "Action". For each device or port in the topology overview, the Status column displays the comparison status as follows:

Icon	Meaning
	Differing topology in at least one lower-level component
	Identical topology
	Topology information is only available offline, or device is disabled
	Topology information is only available online
	Differing topology
	Device does not support topology functions

For each compared port or device, the Action column provides these possible choices:

Icon	Meaning
	No action possible
	Adopt the online interconnection

To repeat the comparison, click the  toolbar button on the topology overview.

For additional information on the topology view, the topology overview, and online/offline topology comparisons, refer to the STEP 7 Information System. Also you can find additional information in the PROFINET with STEP 7 V13 manual (https://support.industry.siemens.com/cs/ww/en/view/49948856).

15.13 Monitoring and modifying values in the CPU

STEP 7 provides online tools for monitoring the CPU:

- You can display or monitor the current values of the tags. The monitoring function does not change the program sequence. It presents you with information about the program sequence and the data of the program in the CPU.
- You can also use other functions to control the sequence and the data of the user program:
  - You can modify the value for the tags in the online CPU to see how the user program responds.
  - You can force a peripheral output (such as Q0.1:P or "Start":P) to a specific value.
  - You can enable outputs in STOP mode.

Note

Always exercise caution when using control functions. These functions can seriously influence the execution of the user/system program.

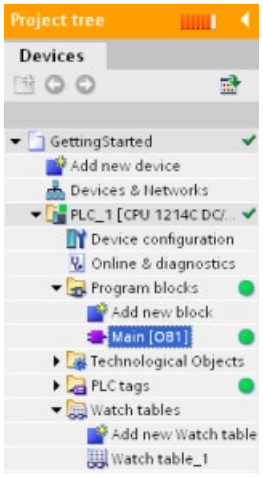


Table 15- 3 Online capabilities of the STEP 7 editors

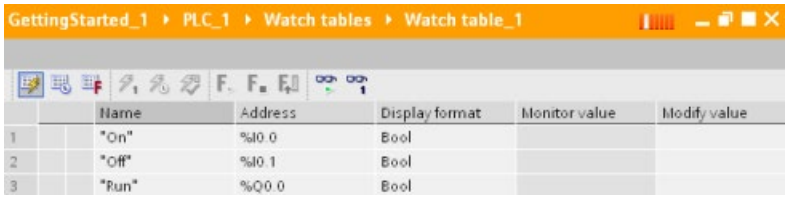
Editor	Monitor	Modify	Force
Watch table	Yes	Yes	No
Force table	Yes	No	Yes
Program editor	Yes	Yes	No
Tag table	Yes	No	No
DB editor	Yes	No	No

15.13.1 Going online to monitor the values in the CPU

To monitor the tags, you must have an online connection to the CPU. Simply click the "Go online" button in the toolbar.



When you have connected to the CPU, STEP 7 turns the headers of the work areas orange.

The project tree displays a comparison of the offline project and the online CPU. A green circle means that the CPU and the project are synchronized, meaning that both have the same configuration and user program.

Tag tables show the tags. Watch tables can also show the tags, as well as direct addresses.

To monitor the execution of the user program and to display the values of the tags, click the "Monitor all" button in the toolbar.

The "Monitor value" field shows the value for each tag.

15.13.2 Displaying status in the program editor

You can monitor the status of up to 50 tags in the LAD and FBD program editors. Use the editor bar to display the LAD editor. The editor bar allows you to change the view between the open editors without having to open or close the editors.

In the toolbar of the program editor, click the "Monitoring on/off" button to display the status of your user program.

The network in the program editor displays power flow in green.

You can also right-click on the instruction or parameter to modify the value for the instruction.

15.13.3 Capturing a snapshot of the online values of a DB for restoring values

You can capture a snapshot of the actual values of data block tags from an online CPU for later use.

Note the following prerequisites:

- You must have an online connection to the CPU.
- You must have the DB open in STEP 7.

Capturing a snapshot

To capture a snapshot, follow these steps:

1. In the DB editor, click the "Monitor all tags" button: The "Monitor value" column displays the actual data values.
2. Click the button to capture a snapshot of the actual values and display them in the "Snapshot" column.

You can use this snapshot at a later time to update the actual CPU values or to replace the start values.

Copying the snapshot values to the CPU

To copy the snapshot values to the actual values of the data block tags in the CPU, click the following button: 

The online CPU loads the snapshot values into the actual values. The Monitor value column shows the actual values in the CPU. The scan cycle might subsequently change the values in the CPU from the snapshot values, but at the time you make the copy, the CPU loads the snapshot values in a consistent download.

Note

Be aware that if your snapshot contains state information, timer values, or calculated information, the CPU restores those values as of the time you made the snapshot.

Copying the snapshot values to the start values

To copy the snapshot values to the start values of the data block tags, click the following button: 

After you compile the DB and download it to the CPU, the DB uses the new start values when the CPU goes to RUN mode.

Copying individual snapshot or monitor values to start values

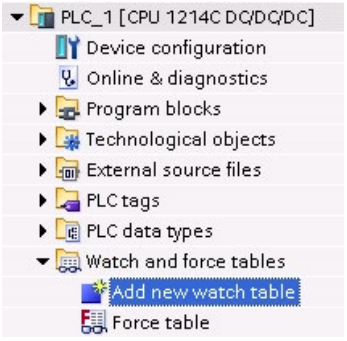
The data block editor also lets you copy individual values and paste them over start values. Simply right-click a value in any value column and select Copy to place it in the Windows clipboard. Then, you can right-click on any start value and select paste to replace that value with the value in the clipboard.

After you compile the DB and download it to the CPU, the DB uses the new start values when the CPU goes to RUN mode.

15.13.4 Using a watch table to monitor and modify values in the CPU

A watch table allows you to perform monitoring and control functions on data points as the CPU executes your program. These data points can be process image (I or Q), M, DB or physical inputs (I_:P), depending on the monitor or control function. You cannot accurately monitor the physical outputs (Q_:P) because the monitor function can only display the last value written from Q memory and does not read the actual value from the physical outputs.

The monitoring function does not change the program sequence. It presents you with information about the program sequence and the data of the program in the CPU.



Control functions enable the user to control the sequence and the data of the program. You must exercise caution when using control functions. These functions can seriously influence the execution of the user/system program. The three control functions are Modify, Force and Enable Outputs in STOP.

With the watch table, you can perform the following online functions:

- Monitoring the status of the tags
- Modifying values for the individual tags

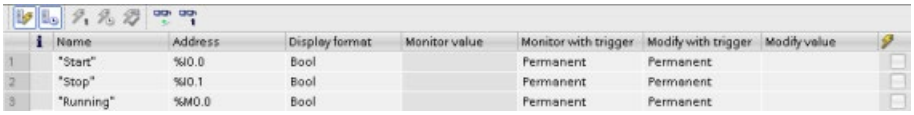
You select when to monitor or modify the tag:

- Beginning of scan cycle: Reads or writes the value at the beginning of the scan cycle
- End of scan cycle: Reads or writes the value at the end of the scan cycle
- Switch to stop

To create a watch table:

1. Double-click "Add new watch table" to open a new watch table.
2. Enter the tag name to add a tag to the watch table.

The following options are available for monitoring tags:



- Monitor all: This command starts the monitoring of the visible tags in the active watch table.
- Monitor now: This command starts the monitoring of the visible tags in the active watch table. The watch table monitors the tags immediately and once only.

The following options are available for modifying tags:

- "Modify to 0" sets the value of a selected address to "0".
- "Modify to 1" sets the value of a selected address to "1".
- "Modify now" immediately changes the value for the selected addresses for one scan cycle.
- "Modify with trigger" changes the values for the selected addresses.

  This function does not provide feedback to indicate that the selected addresses were actually modified. If feedback of the change is required, use the "Modify now" function.
- "Enable peripheral outputs" disables the command output disable and is available only when the CPU is in STOP mode.

To monitor the tags, you must have an online connection to the CPU.

	Name	Address	Display format	Monitor value	Monitor with trigger	Modify with trigger	Modify value
1	"Start"	%I0.0	Bool		Permanent	Permanent	
2	"Stop"	%I0.1	Bool		Permanent	Permanent	
3	"Running"	%M0.0	Bool		Permanent	Permanent	

You use the buttons at the top of the watch table to select the various functions.

Enter the tag name to monitor and select a display format from the dropdown selection. With an online connection to the CPU, click the "Monitor" button to display the actual value of the data point in the "Monitor value" field.

15.13.4.1 Using a trigger when monitoring or modifying PLC tags

Triggering determines at what point in the scan cycle the selected address will be monitored or modified.

Table 15- 4 Types of triggers

Trigger	Description
Permanent	Continuously collects the data
At scan cycle start	Permanent: Continuously collects the data at the start of the scan cycle, after the CPU reads the inputs
	Once: Collects the data at the start of the scan cycle, after the CPU reads the inputs
At scan cycle end	Permanent: Continuously collects the data at the end of the scan cycle, before the CPU writes the outputs
	Once: Collects the data once at the end of the scan cycle, before the CPU writes the outputs
At transition to STOP	Permanent: Continuously collects data when the CPU transitions to STOP
	Once: Collects the data once after the CPU transitions to STOP

For modifying a PLC tag at a given trigger, select either the start or the end of cycle.

- Modifying an output: The best trigger event for modifying an output is at the end of the scan cycle, immediately before the CPU writes the outputs.

  Monitor the value of the outputs at the beginning of the scan cycle to determine what value is written to the physical outputs. Also, monitor the outputs before the CPU writes the values to the physical outputs in order to check program logic and to compare to the actual I/O behavior.

- Modifying an input: The best trigger event for modifying an input is at the start of the cycle, immediately after the CPU reads the inputs and before the user program uses the input values.

  If you suspect values are changing during the scan, you might want to monitor the value of the inputs at the end of the scan cycle to ensure that the value of the input at the end the scan cycle has not changed from the start of the scan cycle. If there is a difference in the values, your user program might be erroneously writing to inputs.

To diagnose why the CPU might have gone to STOP, use the "Transition to STOP" trigger to capture the last process values.

15.13.4.2 Enabling outputs in STOP mode

The watch table allows you to write to the outputs when the CPU is in STOP mode. This functionality allows you to check the wiring of the outputs and verify that the wire connected to an output pin initiates a high or low signal to the terminal of the process device to which it is connected.

⚠ WARNING

Risks in writing to physical outputs in STOP mode

Even though the CPU is in STOP mode, enabling a physical output can activate the process point to which it is connected, possibly resulting in unexpected equipment operation. Unexpected equipment operation can cause death or severe personal injury.

Before writing to an output from the watch table, ensure that changing the physical output cannot cause unexpected equipment operation. Always observe safety precautions for your process equipment.

You can change the state of the outputs in STOP mode when the outputs are enabled. If the outputs are disabled, you cannot modify the outputs in STOP mode. To enable the modification in STOP mode of the outputs from the watch table, follow these steps:

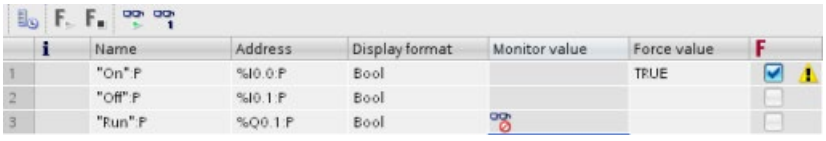
1. Select the "Expanded mode" menu command from the "Online" menu.
2. Select the "Enable peripheral outputs" option of the "Modify" command of the "Online" menu, or from the context menu after right-clicking the row of the Watch table.

You cannot enable outputs in STOP mode if you have configured distributed I/O. An error is returned when you try to do this.

Setting the CPU to RUN mode disables "Enable peripheral outputs" option.

If any inputs or outputs are forced, the CPU is not allowed to enable outputs while in STOP mode. The force function must first be cancelled.

15.13.5 Forcing values in the CPU



15.13.5.1 Using the force table

A force table provides a "force" function that overwrites the value for an input or output point to a specified value for the peripheral input or peripheral output address. The CPU applies this forced value to the input process image prior to the execution of the user program and to the output process image before the outputs are written to the modules.

Note

The force values are stored in the CPU and not in the force table.

You cannot force an input (or "I" address) or an output (or "Q" address). However, you can force a peripheral input or peripheral output. The force table automatically appends a ":P" to the address (for example: "On":P or "Run":P).

	i	Name	Address	Display format	Monitor value	Force value	F
1		"On":P	%I0.0:P	Bool		TRUE	
2		"Off":P	%I0.1:P	Bool			
3		"Run":P	%Q0.1:P	Bool			

In the "Force value" cell, enter the value for the input or output to be forced. You can then use the check box in the "Force" column to enable forcing of the input or output.

Use the "Start or replace forcing" button to force the value of the tags in the force table. Click the "Stop forcing" button to reset the value of the tags.

In the force table, you can monitor the status of the forced value for an input. However, you cannot monitor the forced value of an output.

You can also view the status of the forced value in the program editor.

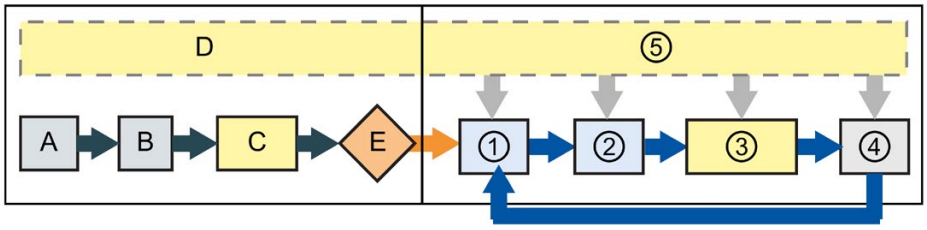
Note

When an input or output is forced in a force table, the force actions become part of the project configuration. If you close STEP 7, the forced elements remain active in the CPU program until they are cleared. To clear these forced elements, you must use STEP 7 to connect with the online CPU and then use the force table to turn off or stop the force function for those elements.

15.13.5.2 Operation of the Force function

The CPU allows you to force input and output point(s) by specifying the physical input or output address (I_:P or Q_:P) in the force table and then starting the force function.

In the program, reads of physical inputs are overwritten by the forced value. The program uses the forced value in processing. When the program writes a physical output, the output value is overwritten by the force value. The forced value appears at the physical output and is used by the process.



When an input or output is forced in the force table, the force actions become part of the user program. Even though the programming software has been closed, the force selections remain active in the operating CPU program until they are cleared by going online with the programming software and stopping the force function. Programs with forced points loaded on another CPU from a memory card will continue to force the points selected in the program.

If the CPU is executing the user program from a write-protected memory card, you cannot initiate or change the forcing of I/O from a watch table because you cannot override the values in the write-protected user program. Any attempt to force the write-protected values generates an error. If you use a memory card to transfer a user program, any forced elements on that memory card will be transferred to the CPU.

Note

Digital I/O points assigned to HSC, PWM, and PTO cannot be forced

The digital I/O points used by the high-speed counter (HSC), pulse-width modulation (PWM), and pulse-train output (PTO) devices are assigned during device configuration. When digital I/O point addresses are assigned to these devices, the values of the assigned I/O point addresses cannot be modified by the force function of the force table.

Startup

A	The clearing of the I memory area is not affected by the Force function.
B	The initialization of the outputs values is not affected by the Force function.
C	During the execution of the startup OBs, the CPU applies the force value when the user program accesses the physical input.
D	The storing of interrupt events into the queue is not affected.
E	The enabling of the writing to the outputs is not affected.

RUN

①	While writing Q memory to the physical outputs, the CPU applies the force value as the outputs are updated.
②	When reading the physical inputs, the CPU applies the force values just prior to copying the inputs into I memory.
③	During the execution of the user program (program cycle OBs), the CPU applies the force value when the user program accesses the physical input or writes the physical output.
④	Handling of communication requests and self-test diagnostics are not affected by the Force function.
⑤	The processing of interrupts during any part of the scan cycle is not affected.

15.14 Downloading in RUN mode

The CPU supports "Download in RUN mode". This capability is intended to allow you to make small changes to a user program with minimal disturbance to the process being controlled by the program. However, implementing this capability also allows massive program changes that could be disruptive or even dangerous.

WARNING

Risks with downloading in RUN mode

When you download changes to the CPU in RUN mode, the changes immediately affect process operation. Changing the program in RUN mode can result in unexpected system operation, which could cause death or serious injury to personnel, and/or damage to equipment.

Only authorized personnel who understand the effects of RUN mode changes on system operation should perform a download in RUN mode.

The "Download in RUN mode" feature allows you to make changes to a program and download them to your CPU without switching to STOP mode:

- You can make minor changes to your current process without having to shut down (for example, change a parameter value).
- You can debug a program more quickly with this feature (for example, invert the logic for a normally open or normally closed switch).

You can make the following program block and tag changes and download them in RUN mode:

- Create, overwrite, and delete Functions (FC), Function Blocks (FB), and Tag tables.
- Create, delete, and overwrite Data Blocks (DB) and instance data blocks for Function Blocks (FB). You can add to DB structures and download them in RUN mode. The CPU can maintain the values of existing block tags and initialize the new data block tags to their initial values, or the CPU can set all data block tags to initial values, depending on your configuration settings (Page 1327). You cannot download a web server DB (control or fragment) in RUN mode.
- Overwrite Organization Blocks (OB); however, you cannot create or delete OBs.

You can download a maximum number of twenty blocks in RUN mode at one time. If you must download more than twenty blocks, you must place the CPU in STOP mode.

If you download changes to a real process (as opposed to a simulated process, which you might do in the course of debugging a program), it is vital to think through the possible safety consequences to machines and machine operators before you download.

Note

If the CPU is in RUN mode and program changes have been made, STEP 7 always tries to download in RUN first. If you do not want this to happen, you must put the CPU into STOP.

If the changes made are not supported in "Download in RUN", STEP 7 prompts the user that the CPU must go to STOP.

15.14.1 Prerequisites for "Download in RUN mode"

To be able to download your program changes to a CPU that is in RUN mode, you must meet these prerequisites:

- Your CPU version is V3.0 or later

  Note

  Your CPU version must be V4.0 or later to modify the extended block interface in RUN mode. (Page 1327)

- Your program must compile successfully.
- You must have successfully established communication between the programming device where you are running STEP 7 and the CPU.

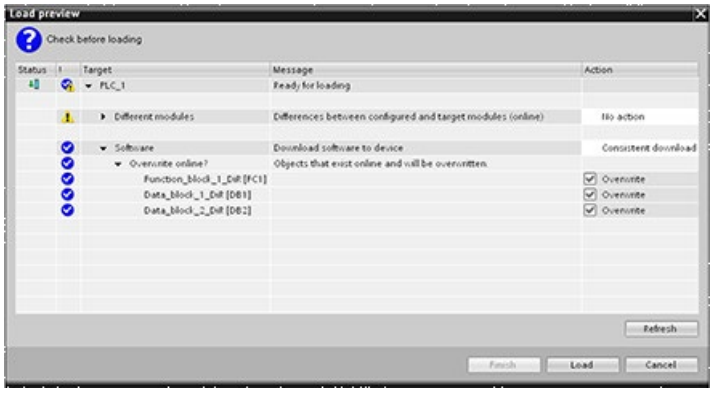
15.14.2 Changing your program in RUN mode

To change the program in RUN mode, you must first ensure that the CPU and program meet the prerequisites (Page 1322), and then follow these steps:

1. To download your program in RUN mode, select one of the following methods:
   - Select the "Download to device" command from the "Online" menu.
   - Click the "Download to device" button in the toolbar.
   - In the "Project tree", right-click "Program blocks" and select the "Download to device > Software" command.

   If the program compiles successfully, STEP 7 starts to download the program to the CPU.

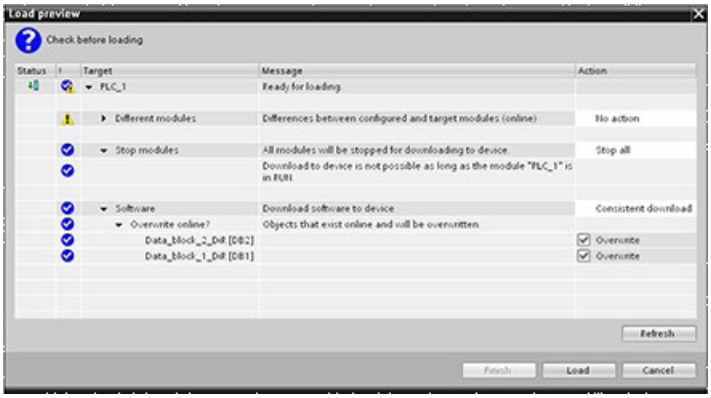
2. When STEP 7 prompts you to load your program or cancel the operation, click "Load" to download the program to the CPU.



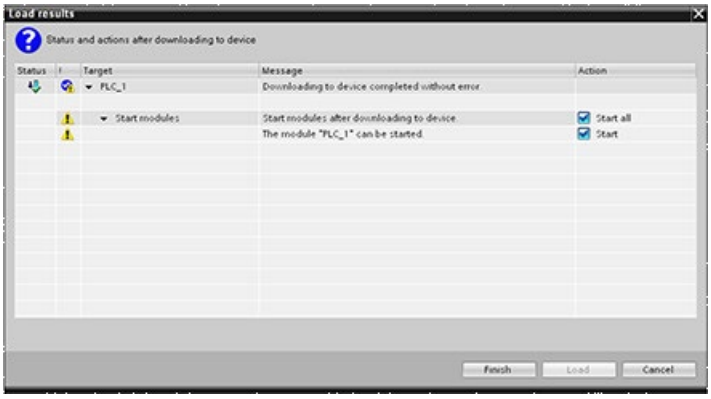
15.14.3 Downloading selected blocks

From the Program blocks folder, you can select a single block or a selection of blocks for downloading.

If you select a single block for downloading, then the only option in the "Action" column is "Consistent download". You can expand the category line to be sure what blocks are to be loaded. In this example, a small change was made to the offline block, and no other blocks need to be loaded.



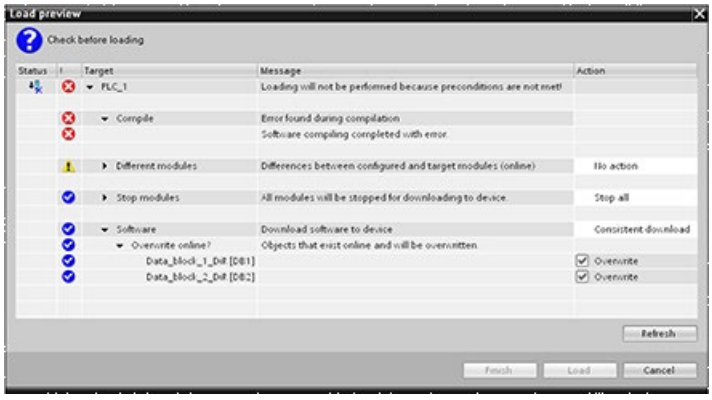
In this example, more than one block is needed for downloading.



Note

You can download a maximum number of twenty blocks in RUN mode at one time. If you must download more than twenty blocks, you must place the CPU in STOP mode.

If you attempt to download in RUN, but the system detects that this is not possible prior to the actual download, then the Stop modules category line appears in the dialog.



Click the "Load" button, and the "Load results" dialog appears. Click the "Finish" button to complete the download.

15.14.4 Downloading a single selected block with a compile error in another block

If you attempt a consistent download with a compile error in another block, then the dialog indicates an error, and the load button is disabled.

You must correct the compile error in the other block. Then, the "Load" button becomes active.

15.14.5 Modifying and downloading existing blocks in RUN mode

The Download in Run feature allows you to add and modify tags in data blocks and function blocks and then download the changed block to the CPU in RUN mode.

Download without reinitialization

Each DB and FB has an amount of reserved memory, which you can use for adding tags to the block that you can subsequently download in RUN mode. By default, the initial size of the memory reserve is 100 bytes. You can add additional tags to your data up to the size of the memory reserve and download the extended block to the CPU in RUN mode. You can also increase the memory reserve if you need more memory for additional tags in your block. If you add more tags than the amount of memory you have allocated, you cannot download the extended block to the CPU in RUN mode.

The "Download without reinitialization" feature allows you to extend a data block by adding more data block tags and download the extended data block in RUN mode. In this way, you can add tags to a data block and download it without reinitializing your program. The CPU retains the values of the existing data block tags and initializes the newly-added tags to their start values.

To enable this function for an online project with a CPU in RUN mode, follow these steps:

1. From the Program blocks folder in the STEP 7 project tree, open the block.
2. Click the "Download without reinitialization" toggle button in the block editor to enable the function. (The icon has a box around it when you have enabled it:)
3. Click OK on the prompt to confirm your choice.
4. Add tags to the block interface and download the block in RUN mode. You can add and download as many new tags as your memory reserve allows.

If you have added more bytes to your block than you have configured for the memory reserve, STEP 7 displays an error when you attempt to download the block in RUN mode. You must edit the block properties to increase the amount. You cannot delete existing entries or modify the “Memory reserve” of the block while the “Download without reinitialization” function is enabled. To disable the "Download without reinitialization" function, follow these steps:

1. Click the "Download without reinitialization" toggle button in the block editor to disable the function. (The icon does not have a box around it when you have disabled it:)
2. Click OK on the prompt to confirm your choice.
3. Download the block. On the download dialog, you must select "reinitialize" in order to download the extended block.

The download then reinitializes all existing and new block tags to their start values.

Downloading retentive block tags

Downloading retentive block tags in RUN mode requires the allocation of a retentive memory reserve. To configure this retentive memory reserve, follow these steps:

1. From the Program blocks folder in the STEP 7 project tree, right-click the block and select "Properties" from the context menu.
2. Select the "Download without reinitialization" property.
3. Select the check box for "Enable download without reinitialization for retentive tags".
4. Configure the number of bytes available for the retentive memory reserve.
5. Click OK to save your changes.
6. Add retentive data block tags to the data block and download the data block in RUN mode. You can add and download as many new retentive data block tags as your retentive memory reserve allows.

If you have added more retentive bytes to your data block than you have configured for the retentive memory reserve, STEP 7 displays an error when you attempt to download the block in RUN mode. You can only add retentive block tags up to the retentive memory reserve in order to be able to download them in RUN mode.

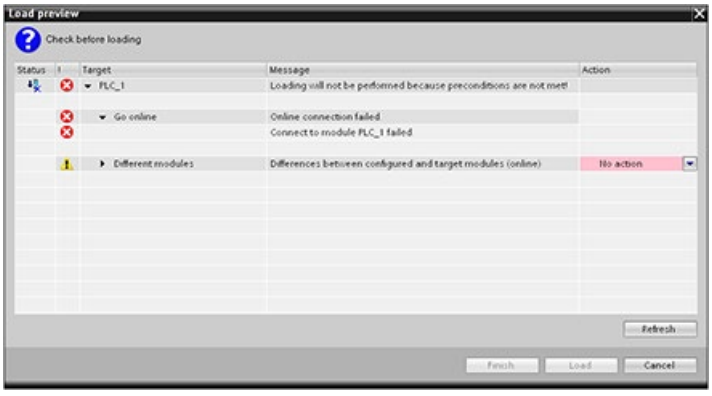
When you download the extended retentive block tags, the tags contain their current values.

Configuring amount of reserved memory for new blocks

The default memory reserve size for new data blocks is 100 bytes. When you create a new block, it has 100 bytes available in reserve. If you want the memory reserve size to be different for new blocks, you can change the setting in the PLC programming settings:

1. From STEP 7, select the **Options > Settings** menu command.
2. From the Settings dialog, expand "PLC programming" and select "General".
3. In the "Download without reinitialization" section, enter the number of bytes for the memory reserve.

When you create new blocks, STEP 7 uses the memory reserve configuration that you entered for the new blocks.



Restrictions

The following restrictions apply to editing and downloading blocks in RUN mode:

- Extending the block interface by adding new tags and downloading in RUN mode is only available for optimized blocks (Page 186).
- You cannot change the structure of a block and download the changed block in RUN mode without reinitializing. Adding new members to a Struct (Page 130) tag, changing tag names, array sizes, data types, or retentive status all require that you reinitialize the block if you download it in RUN mode. The only modifications to existing block tags that you can perform and still download the block in RUN mode without reinitialization are changes to start values (data blocks), default values (function blocks) or comments.
- You cannot download more new block tags in RUN mode than the memory reserve can accommodate.
- You cannot download more new retentive block tags in RUN mode than the retentive memory reserve can accommodate.

15.14.6 System reaction if the download process fails

During the initial Download in RUN operation, if a network connection failure occurs, STEP 7 displays the following "Load preview" dialog:

15.14.7 Considerations when downloading in RUN mode

Before downloading the program in RUN mode, consider the effect of a RUN-mode modification on the operation of the CPU for the following situations:

- If you deleted the control logic for an output, the CPU maintains the last state of the output until the next power cycle or transition to STOP mode.
- If you deleted a high-speed counter or pulse output functions which were running, the high-speed counter or pulse output continues to run until the next power cycle or transition to STOP mode.
- Any logic that is conditional on the state of the first scan bit will not be executed until the next power cycle or transition from STOP to RUN mode. The first scan bit is set only by the transition to RUN mode and is not affected by a download in RUN mode.
- The current values of data blocks (DB) and/or tags can be overwritten.

Note

Before you can download your program in RUN mode, the CPU must support changes in RUN mode, the program must compile with no errors, and the communication between STEP 7, and the CPU must be error-free.

You can make the following changes in program blocks and tags and download them in RUN mode:

- Create, overwrite, and delete Functions (FC), Function Blocks (FB), and Tag tables.
- Create and delete Data Blocks (DB); however, DB structure changes cannot be overwritten. Initial DB values can be overwritten. You cannot download a web server DB (control or fragment) in RUN mode.
- Overwrite Organization Blocks (OB); however, you cannot create or delete OBs.

You can download a maximum number of twenty blocks in RUN mode at one time. If you must download more than twenty blocks, you must place the CPU in STOP mode.

Once you initiate a download, you cannot perform other tasks in STEP 7 until the download completes.

Instructions that might fail due to "Download in RUN mode"

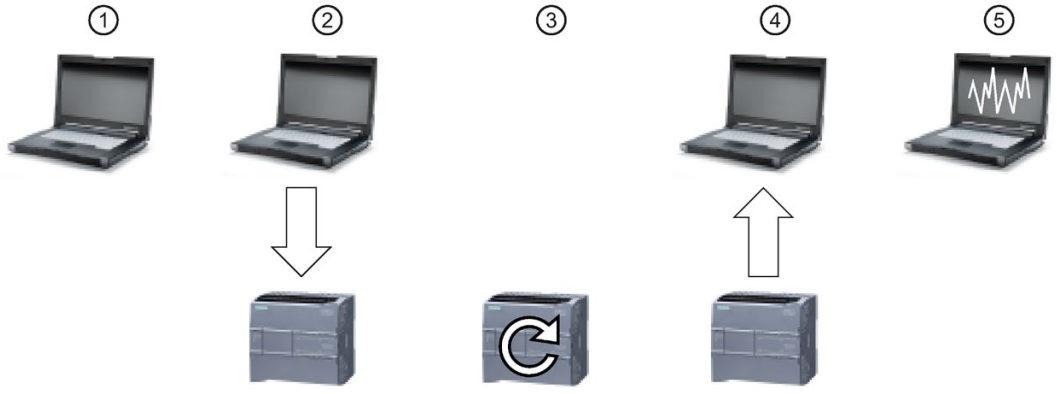
The following instructions might experience a temporary error when download in run changes are being activated in the CPU. The error occurs when the instruction is initiated while the CPU is preparing to activate the downloaded changes. During this time, the CPU suspends initiation of user-program access to the Load Memory, while it completes in-progress user-program access to Load Memory. This is done so that downloaded changes can be activated consistently.

Instruction	Response while Activation is Pending
DataLogCreate	STATUS = W#16#80C0, ERROR = TRUE
DataLogOpen	STATUS = W#16#80C0, ERROR = TRUE
DataLogWrite	STATUS = W#16#80C0, ERROR = TRUE
DataLogClose	STATUS = W#16#80C0, ERROR = TRUE
DataLogNewFile	STATUS = W#16#80C0, ERROR = TRUE
DataLogClear	STATUS = W#16#80C0, ERROR = TRUE
DataLogDelete	STATUS = W#16#80C0, ERROR = TRUE
READ_DBL	RET_VAL = W#16#82C0
WRIT_DBL	RET_VAL = W#16#82C0
Create_DB	RET_VAL = W#16#80C0
Delete_DB	RET_VAL = W#16#80C0
RTM	RET_VAL = 0x80C0

In all cases the RLO output from the instruction will be false when the error occurs. The error is temporary. If it occurs, the instruction should be retried later.

Note

You must not retry the operation in the current execution of the OB.



15.15 Tracing and recording CPU data on trigger conditions

STEP 7 provides trace and logic analyzer functions with which you can configure variables for the PLC to trace and record. You can then upload the recorded trace measurement data to your programming device and use STEP 7 tools to analyze, manage, and graph your data. You use the Traces folder in the STEP 7 project tree to create and manage traces.

Note

The trace measurement data is available only within the STEP 7 project and is not available for processing by other tools.

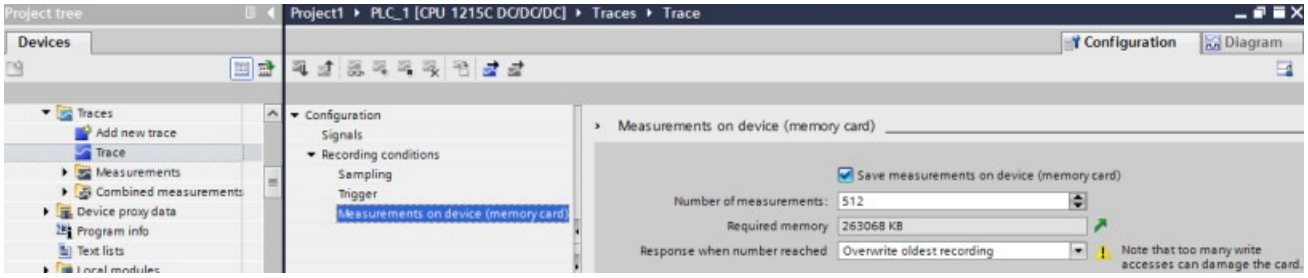
The following figure shows the various steps of the trace feature:

① Configure the trace in the trace editor of STEP 7. You can configure the following options:
- Data values to record
- Recording duration
- Recording frequency
- Trigger condition

② Transfer the trace configuration from STEP 7 to the PLC.

③ The PLC executes the program, and when the trigger condition occurs, begins recording the trace data.

④ Transfer the recorded values from the PLC to STEP 7.



⑤ Use the tools in STEP 7 to analyze, graphically display, and save the data.

The S7-1200 supports two trace jobs with a maximum of 16 variables captured per trigger event. Each trace job provides 524288 bytes of RAM for the recording of trace values and associated overhead, for example variable addresses and time stamps.

Saving trace measurements to the memory card

The S7-1200 CPU can only save trace measurements to the SIMATIC memory card. If you do not have a memory card in your CPU, the CPU will log a diagnostic buffer entry if the program attempts to save trace measurements. The CPU limits the space allocated to trace measurements such that 1 MB of external load memory must always be available. If a trace measument would require more memory than the maximum allowance, the CPU will not save the measurement and will log a diagnostic buffer entry.

In addition, if you select "Overwrite oldest recording" in STEP 7, the continual writing can reduce the lifetime of load memory. When you select "Overwrite oldest recording", the CPU replaces the oldest measurement with the newest measurement after it has stored the configured number of trace measurements, and continues tracing and saving measurements. Overwriting the oldest measurements is useful in capturing intermittent problems.

The CPU supports a maximum of 999 trace measurement results. During the time that the CPU is saving the trace measurements to external load memory, the CPU does not check the trigger condition for the trace job. Once the CPU finishes saving the trace measurements, the CPU resumes checking for trigger conditions.

Access to examples

See the STEP 7 information system for details about how to program a trace, how to download the configuration, upload the trace data, and display the data in the logic analyzer. You can find detailed examples there in the "Using online and diagnostics functions > Using the trace and logic analyzer function" chapter.

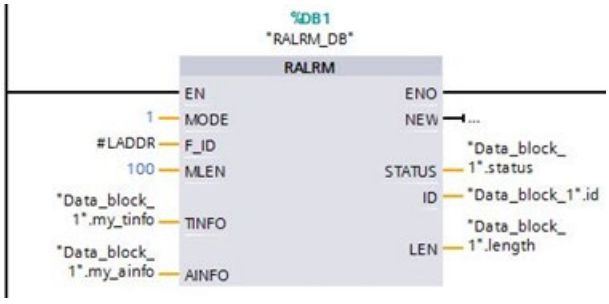
In addition, the online manual "Industry Automation SINAMICS/SIMATIC Using the trace and logic analyzer function" (https://support.industry.siemens.com/cs/ww/en/view/64897128) is an excellent reference.

15.16 Determining the type of wire break condition from an SM 1231 module

As described in the topic Measurement ranges of the analog inputs for voltage and current (SB and SM) (Page 1458), the SM 1231 module returns an analog input value of 32767 (16#7FFF) for both a wire break condition or an overflow condition. If you want to determine which of these two conditions occurred, you can include logic in your STEP 7 program to make the determination. The method to determine the condition type consists of these tasks:

- Create a Diagnostic error interrupt OB to be called whenever there is an incoming or outgoing diagnostic event.
- Include a call to the RALRM instruction.
- Set up an array of bytes for the AINFO parameter, which includes the information about the condition type.
- Evaluate bytes 32 and 33 of the AINFO structure of the RALRM_DB when the CPU triggers the Diagnostic Interrupt OB..

Creating a Diagnostic error interrupt OB



To be able to determine when a wire break condition occurs, create a Diagnostic error interrupt OB. The CPU will call this OB whenever an incoming or outgoing diagnostic event occurs.

When the CPU calls the Diagnostic error interrupt OB, the input parameter LADDR will contain the hardware identifier for the module with the error. You can find the hardware identifier for the SM 1231 module in the STEP 7 device configuration for the SM 1231 module.

Calling the RALRM instruction

To program the RALRM instruction call, follow these steps:

1. Add a call to RALRM in your STEP 7 program.
2. Set the F_ID input parameter to the hardware identifier in the LADDR parameter of the Diagnostic error interrupt OB.
3. Use an array of bytes for the TINFO and AINFO input parameters. Use an array size of 34 bytes or greater.

Interpreting AINFO after a diagnostic interrupt has occurred

The AINFO byte array will contain the information about the module diagnostics after the Diagnostic error interrupt OB executes.

Bytes 0 - 25 are header information. The bytes pertaining to the module diagnostic are as follows:

Byte	Description	
26 and 27	Word value 16#8000 - indicates the diagnostic is a Profinet style diagnostic	
28 and 29	Word containing channel number responsible for this diagnostic	
30	Bit pattern aaabb000 that indicates the type of channel (aaa) and type of error (bb)	
	aaa	bb
	000: reserved	00: reserved
	001: input channel	01: incoming error
	010: output channel	10: outgoing error
	011: input/output channel	11: outgoing error, other errors present
31	Indication of data format 0: Free data format 1: Bit 2: Two bits 3: Four bits 4: Byte 5: Word (two bytes) 6: Double word (four bytes) 7: Two double words (eight bytes)	
32 and 33	Word that defines the type of error: 16#0000: reserved 16#0001: short circuit 16#0002: undervoltage 16#0003: overvoltage 16#0004: overload 16#0005: over temperature 16#0006: wire break 16#0007: high limit exceeded 16#0008: low limit exceeded 16#0009: error	

For example, consider bytes 26 - 33 of this AINFO structure:

29		my_ainfo[26]	Byte	16#0	16#80
30		my_ainfo[27]	Byte	16#0	16#00
31		my_ainfo[28]	Byte	16#0	16#00
32		my_ainfo[29]	Byte	16#0	16#00
33		my_ainfo[30]	Byte	16#0	16#28
34		my_ainfo[31]	Byte	16#0	16#05
35		my_ainfo[32]	Byte	16#0	16#00
36		my_ainfo[33]	Byte	16#0	16#07

- The Word at bytes 26 and 27 is 16#8000, which indicates that this is a Profinet style diagnostic.
- The Word at bytes 28 and 29 indicates this is a diagnostic for channel 0 or the module.
- Byte 30 is 16#28, which when interpreted as the bit pattern aaa bb 00 is 001 01 000. This value indicates that this diagnostic is for an input channel and is an incoming error.
- Byte 31 is 5, which indicates a Word value
- The word value at bytes 32 and 33 is 16#0007, which indicates high limit exceeded.

By caputuring the AINFO information from a Diagnostic error interrupt event, you can thus determine the nature of the diagnostic event.

15.17 Backing up and restoring a CPU

15.17.1 Backup and restore options

You will make a number of changes to your automation system over time, for example, add new devices, replace existing devices or adapt the user program. If these changes were to result in undesirable behavior, you can restore the automation plant to an earlier version if you have a backup. STEP 7 and the S7-1200 CPU offer different options for backing up and restoring the hardware configuration and software.

Backup options

The table below provides an overview of the backup and restoration options of S7 CPUs:

	Snapshot of the monitored values	**Upload from device (software)**	**Upload device as new station (hardware and software)**	**Download backup from online device**
Use case	Restoring a specific status of a data block. The actual values of data blocks including time stamp are accepted in the project.	Upload blocks from a CPU to the project.	Upload of hardware configuration and software from a device to the project.	Create a complete backup of a CPU as a restore point. The backup copy is consistent and cannot be changed or opened.
Requirement	The CPU exists in a project. The data blocks must be identical online and offline.	The CPU exists in the project.	The device is available in the hardware catalog of TIA Portal. Any necessary HSPs or GSD files are installed.	-
Possible in mode	RUN, STOP	RUN, STOP	RUN, STOP	STOP
Possible for F-CPUs	Yes	Yes	No	Yes
Backup can be edited	Yes	Yes	Yes	No

Backup contents

The table below shows which data you can download and back up with which options:

	Snapshot of the monitored values	Upload from device (software)	Upload device as new station (hardware and software)	Download backup from online device
Actual values of the data blocks	Snapshot is possible	Download is possible	Download is possible	Backup is possible
Software blocks	-	Download is possible	Download is possible	Backup is possible
PLC tags (names of tags and constants)	-	Download is possible	Download is possible	Backup is possible
Technology objects	-	Download is possible	Download is possible	Backup is possible
Hardware configuration	-	-	Download is possible	Backup is possible
Monitoring tables (Web server)	-	-	Download is not possible	Backup is possible
Local data, bit memories, timers, counters and process picture	Snapshot is not possible	Download is not possible	Download is not possible	Backup is possible
Archives and recipes (PLC)	-	-	-	Backup is possible
General data on the SIMATIC memory card, for example, help for program blocks or GSD files	-	-	-	Backup is possible

Special considerations during backup of actual values

The "Backup from online device" type of backup backs up the actual values of the tags that are set as retentive. To ensure consistency of the retentive data, disable all write access to retentive data during the backup.

A transition from STOP to RUN mode sets actual values of the non-retentive data to their start values. A CPU backup contains only the start values of non-retentive data.

15.17.2 Backing up an online CPU

Making a backup of your configuration can be useful if you want to return to a specific configuration. You can restore the current configuration at a later time.

Prerequisites

You can create as many backups as you want and store a variety of configurations for a CPU. To make a backup, you must meet the following prerequisites:

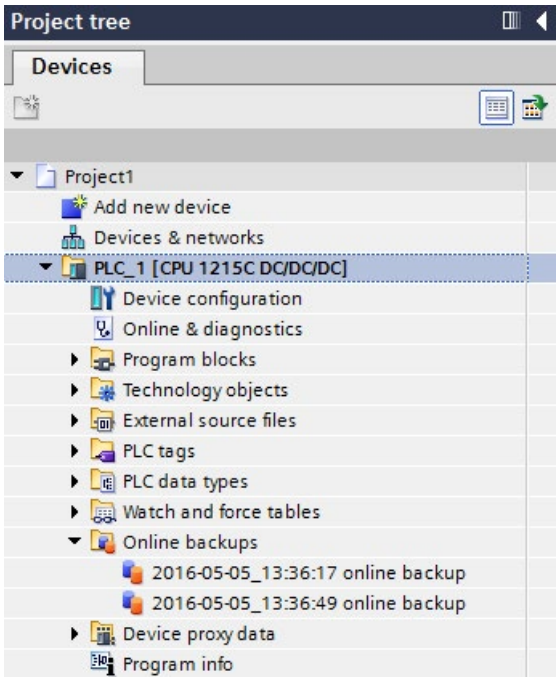
- You have already created the CPU in the STEP 7 project.
- You have connected the CPU to the programming device/PC directly using the PROFINET interface of the CPU. Backup and restore operations do not support the PROFIBUS interfaces of the CMs.
- The CPU is online. (If there is no online connection, the backup process establishes an online connection.)
- The CPU is in "STOP" mode. (If the CPU is not in STOP mode, the backup process prompts you to allow the CPU to go to STOP mode.)

Procedure

To create a backup of the current configuration of a CPU, follow these steps:

1. Select the CPU in the project tree.
2. Select the "Backup from online device" command in the "Online" menu.

   If necessary, you must enter the password for read access to the CPU and confirm that the CPU should enter "STOP" mode.



Result

The backups are named with the name of the CPU and the time and date of the backup. The backup includes all data that are needed to restore a particular configuration of a CPU. The CPU backs up the following data:

- Contents of the memory card if one is present
- Retentive memory areas of data blocks, counters, and bit memory
- Other retentive memory contents, such as IP address parameters

The backup contains the current values of the CPU but does not include the diagnostic buffer.

You can find the backup in the project tree under the CPU in the "Online backups" folder.The following figure shows an S7-1200 CPU for which two backups have been created:

Note

Note that you can also back up the online CPU from the SIMATIC Automation Tool (SAT) or the Web server Online backup standard Web page (Page 1015).

When you back files up from STEP 7, STEP 7 stores the files within the STEP 7 project. When you back files up from the Web server, your PC or device saves the backup files in the default folder for downloads. You cannot restore STEP 7 backup files from the Web server and you cannot restore Web server backup files from STEP 7. You can, however, save STEP 7 backup files directly to the download folder of your PC or device. If you do so, then you can restore these files from the Web server.

Saving backup files to your PC or device

To save a backup file to your PC or device, follow these steps:

1. Right-click a file from the Online backups folder in the project tree.
2. Select "Save as" from the context menu.
3. Navigate to the folder where you want to save the file, for example the default folder for downloads on your PC or device.
4. Click Save.

15.17.3 Restoring a CPU

If you have backed up the configuration of a CPU at an earlier point in time, you can transfer the backup to the CPU. The CPU goes to STOP while restoring a backup. If an access level is configured for the CPU, you must supply the password for read access to the CPU.

WARNING

Restoring backups with unknown content

If you restore a backup with unknown content, you can cause serious damage or injuries in case of malfunctions or program errors.

Make sure that the backup consists of a configuration with known content.

Prerequisites

To restore a backup, you must meet the following prerequisites:

- The STEP 7 project includes a configuration for the CPU and a previously-made backup.
- The CPU is connected to the programming device/PC directly through the PROFINET interface of the CPU.
- The CPU is in "STOP" mode.
- You know the password for full access to the CPU, if an access level was configured.

Procedure

To restore a backup, follow these steps:

1. Open the CPU in the project tree to display the lower-level objects.
2. Select the backup you want to restore from the "Online backups" folder.
3. From the "Online" menu, select the "Download to device" command.
   - If you had previously established an online connection (Page 1299), the "Load preview" dialog opens. This dialog displays alarms and recommends actions needed for the loading operation.
   - If you had not previously established an online connection, the "Extended download to device" dialog opens, and you must first select the interface from which you want to establish the online connection to the CPU.
4. Check the alarms in the "Load preview" dialog, and select the actions in the "Action" column, if necessary.
5. Click the "Load" button (The "Load" button is selectable as soon as downloading is possible.)

6. STEP 7 restores the backup to the CPU. From the "Load results" dialog, you can check whether or not the loading operation was successful and take any further action that might be necessary.
7. After reviewing the "Load results" dialog, click the "Finish" button.

   If prompted, enter the password for full access to the CPU and confirm that the CPU can enter "STOP" mode.

   STEP 7 restores the contents of the backup to the CPU and restarts the CPU.

Note

Note that you can also restore a CPU backup from the Web server Online backup standard Web page (Page 1015).

Technical specifications

A

A.1 Siemens Online Support website

Technical information for these products is available at the Siemens Industry Online Support website (https://support.industry.siemens.com/cs/us/en/).

A.2 General technical specifications

Standards compliance

The S7-1200 automation system design conforms with the following standards and test specifications. The test criteria for the S7-1200 automation system are based on these standards and test specifications.

Note that not all S7-1200 models may be certified to these standards, and certification status may change without notification. It is your responsibility to determine applicable certifications by referring to the ratings marked on the product. Consult your local Siemens representative if you need additional information related to the latest listing of exact approvals by part number.

CE approval

The S7-1200 Automation System satisfies requirements and safety related objectives according to the EC directives listed below, and conforms to the harmonized European standards (EN) for the programmable controllers listed in the Official Journals of the European Community.

- EC Directive 2006/95/EC (Low Voltage Directive) "Electrical Equipment Designed for Use within Certain Voltage Limits"
  - EN 61131-2 Programmable controllers - Equipment requirements and tests
- EC Directive 2004/108/EC (EMC Directive) "Electromagnetic Compatibility"
  - Emission standard
    EN 61000-6:+A1: Industrial Environment
  - Immunity standard
    EN 61000-6-2: Industrial Environment
- EC Directive 94/9/EC (ATEX) "Equipment and Protective Systems Intended for Use in Potentially Explosive Atmosphere"
  - EN 60079-0:+A11
  - EN 60079-15: Type of Protection 'n'

The CE Declaration of Conformity is held on file available to competent authorities at:

Siemens AG
Sector Industry
DF FA AS DH AMB
Postfach 1963
D-92209 Amberg
Germany

cULus approval

Underwriters Laboratories Inc. complying with:

- Underwriters Laboratories, Inc.: UL 508 Listed (Industrial Control Equipment)
- Canadian Standards Association: CSA C22.2 Number 142 (Process Control Equipment)

Note

The SIMATIC S7-1200 series meets the CSA standard.

The cULus logo indicates that the S7-1200 has been examined and certified by Underwriters Laboratories (UL) to standards UL 508 and CSA 22.2 No. 142.

FM approval

Factory Mutual Research (FM)
Approval Standard Class Number 3600 and 3611
Approved for use in:
Class I, Division 2, Gas Group A, B, C, D, Temperature Class T3C Ta = 60 °C
Class I, Zone 2, IIC, Temperature Class T3 Ta = 60 °C
Canadian Class I, Zone 2 Installation per CEC 18-150

IMPORTANT EXCEPTION: See Technical Specifications for the number of inputs or outputs allowed on simultaneously. Some models are de-rated for Ta = 60 °C.

WARNING
Substitution of components can impair the suitability for Class I, Division 2 and Zone 2.
Repair of units should only be performed by an authorized Siemens Service Center.

IECEx approval

EN 60079-0: Explosive Atmospheres – General Requirements

EN60079-15: Electrical Apparatus for Potentially Explosive Atmospheres
Type of protection 'nA'
US/FMG/ExTR14.0013
Ex nA IIC Gc T3

IECEx rating information may appear on the product with the FM Hazardous Location information.

Only products marked with an IECEx rating are approved. Consult your local Siemens representative if you need additional information related to the latest listing of exact approvals by part number.

Relay models are not included in IECEx approvals.

Refer to specific product marking for temperature rating.

Install modules in a suitable enclosure providing a minimum degree of protection of IP54 according to IEC 60079-15.

ATEX approval

ATEX approval applies to DC models only. ATEX approval does not apply to AC and Relay models.

EN 60079-0: Explosive Atmospheres - General Requirements

EN 60079-15: Electrical Apparatus for Potentially Explosive Atmospheres;
Type of protection 'nA'
II 3 G Ex nA IIC T4 or T3 Gc

Special conditions for safe use:

Install modules in a suitable enclosure providing a minimum degree of protection of IP54 according to EN 60529, or in a location providing an equivalent degree of protection.

Attached cables and conductors should be rated for the actual temperature measured under rated conditions.

Provisions should be made to prevent the rated voltage at the power supply terminals from being exceeded by transient disturbances of more than 119 V.

Australia and New Zealand - RCM Mark (Regulatory Compliance Mark)

The S7-1200 automation system satisfies requirements of standards to AS/NZS 61000.6.4 and IEC 610000-6-4 (Class A).

Korea Certification

The S7-1200 automation system satisfies the requirements of the Korean Certification (KC Mark). It has been defined as Class A Equipment and is intended for industrial applications and has not been considered for home use.

Eurasian Customs Union approval (Belarus, Kazakhstan, Russian Federation)

EAC (Eurasion Conformity): Declaration of Conformity according to Technical Regulation of Customs Union (TR CU)

Maritime approval

The S7-1200 products are periodically submitted for special agency approvals related to specific markets and applications. Consult your local Siemens representative if you need additional information related to the latest listing of exact approvals by part number.

Classification societies:

- ABS (American Bureau of Shipping): U.S.A.
- BV (Bureau Veritas): France
- DNV (Det Norske Veritas): Norway
- GL (Germanischer Lloyd): German
- LRS (Lloyds Register of Shipping): England
- Class NK (Nippon Kaiji Kyokai): Japan
- Korean Register of Shipping: Korea
- CSS (China Classification Society): China

Industrial environments

The S7-1200 automation system is designed for use in industrial environments.

Table A- 1 Industrial environments

Application field	Emission requirements	Immunity requirements
Industrial	EN 61000-6-4:2007+A1	EN 61000-6-2:2005

Note

The S7-1200 automation system is intended for use in industrial areas; use in residential areas can have an impact on radio or TV reception. If you use the S7-1200 in residential areas, you must ensure that its radio interference emission complies with the limit value Class B in accordance with EN 55011.

Examples of suitable measures for achieving RF interference, level Class B include:

- Installation of the S7-1200 in a grounded control cabinet

- Use of noise filters in the supply lines

Ensure that the radio interference emission complies with Class B in accordance with EN 55011.

Individual acceptance is required (final installation must meet all safety and EMC requirements of a residential installation).

Electromagnetic compatibility

Electromagnetic Compatibility (EMC) is the ability of an electrical device to operate as intended in an electromagnetic environment and to operate without emitting levels of electromagnetic interference (EMI) that may disturb other electrical devices in the vicinity.

Table A- 2 Immunity per EN 61000-6-2

Electromagnetic compatibility - Immunity per EN 61000-6-2	
EN 61000-4-2 Electrostatic discharge	8 kV air discharge to all surfaces 6 kV contact discharge to exposed conductive surfaces
EN 61000-4-3 Radiated, radio-frequency, electromagnetic field immunity test	80 to 1000 MHz, 10 V/m, 80% AM at 1 kHz 1.4 to 2.0 GHz, 3 V/m, 80% AM at 1 kHz 2.0 to 2.7 GHz, 1 V/m, 80% AM at 1 kHz
EN 61000-4-4 Fast transient bursts	2 kV, 5 kHz with coupling network to AC and DC system power 2 kV, 5 kHz with coupling clamp to I/O
EN 6100-4-5 Surge immunity	AC systems - 2 kV common mode, 1 kV differential mode DC systems - 2 kV common mode, 1 kV differential mode For DC systems, refer to Surge immunity below
EN 61000-4-6 Conducted disturbances	150 kHz to 80 MHz, 10 V RMS, 80% AM at 1kHz
EN 61000-4-11 Voltage dips	AC systems 0% for 1 cycle, 40% for 12 cycles and 70% for 30 cycles at 60 Hz

Table A- 3 Conducted and radiated emissions per EN 61000-6-4

Electromagnetic compatibility - Conducted and radiated emissions per EN 61000-6-4		
Conducted Emissions EN 55016, Class A, Group 1	0.15 MHz to 0.5 MHz	<79dB (µV) quasi-peak; <66 dB (µV) average
	0.5 MHz to 5 MHz	<73dB (µV) quasi-peak; <60 dB (µV) average
	5 MHz to 30 MHz	<73dB (µV) quasi-peak; <60 dB (µV) average
Radiated Emissions EN 55016, Class A, Group 1	30 MHz to 230 MHz	<40dB (µV/m) quasi-peak; measured at 10m
	230 MHz to 1 GHz	<47dB (µV/m) quasi-peak; measured at 10m
	1 GHz to 3 GHz	< 76dB (uV/m) quasi peak, measured at 10m

Surge immunity

Wiring systems subject to surges from lightning strike coupling must be equipped with external protection. One specification for evaluation of protection from lightning type surges is found in EN 61000-4-5, with operational limits established by EN 61000-6-2. S7-1200 DC CPUs and signal modules require external protection to maintain safe operation when subject to surge voltages defined by this standard.

Listed below are some devices that support the needed surge immunity protection. These devices only provide the protection if they are properly installed according to the manufacturer's recommendations. Devices manufactured by other vendors with the same or better specifications can also be used:

Table A- 4 Devices that support surge immunity protection

Sub-system	Protection device
+24 V DC power	BLITZDUCTOR VT, BVT AVD 24, Part Number 918 422
Industrial Ethernet	DEHNpatch DPA M CLE RJ45B 48, Part Number 929 121
RS-485	BLITZDUCTOR XT, Basic Unit BXT BAS, Part Number 920 300
	BLITZDUCTOR XT, Module BXT ML2 BD HFS 5, Part Number 920 271
RS-232	BLITZDUCTOR XT, Basic Unit BXT BAS, Part Number 920 300
	BLITZDUCTOR XT, Module BXT ML2 BE S 12, Part Number 920 222
+24 V DC digital inputs	DEHN, Inc., Type DCO SD2 E 24, Part Number 917 988
+24 V DC digital outputs and sensor supply	DEHN, Inc., Type DCO SD2 E 24, Part Number 917 988
Analog IO	DEHN, Inc., Type DCO SD2 E 12, Part Number 917 987
Relay outputs	None required

Environmental conditions

Table A- 5 Shipping and storage

Environmental conditions - Shipping and storage	
EN 60068-2-2, Test Bb, Dry heat and EN 60068-2-1, Test Ab, Cold	-40 °C to +70 °C
EN 60068-2-30, Test Db, Damp heat	25 °C to 55 °C, 95% humidity
EN 60068-2-14, Test Na, temperature shock	-40 °C to +70 °C, dwell time 3 hours, 2 cycles
EN 60068-2-32, Free fall	0.3 m, 5 times, product packaging
Atmospheric pressure	1139 to 660 hPa (corresponding to an altitude of -1000 to 3500 m)

Table A- 6 Climatic ambient conditions

Environmental conditions - Climatic ambient conditions	
The S7-1200 automation system is suitable for use in weather-proof, fixed locations. The operating conditions are based on requirements according to DIN IEC 60721-3-3: • Class 3M3 (mechanical requirements) • Class 3K3 (climatic requirements)	
Ambient temperature range (Inlet Air 25 mm below unit)	-20 °C to 60 °C horizontal mounting -20 °C to 50 °C vertical mounting 95% non-condensing humidity Unless otherwise specified
Atmospheric pressure	1139 to 795 hPa (corresponding to an altitude of -1000 to 2000 m)
Concentration of contaminants	SO_2: < 0.5 ppm; H_2S: < 0.1 ppm; RH < 60% non-condensing
	ISA-S71.04 severity level G1, G2, G3
EN 60068-2-14, Test Nb, temperature change	0 °C to 60 °C
EN 60068-2-27 Mechanical shock	15 g, 11 ms pulse, 6 shocks in each of 3 axis
EN 60068-2-6 Sinusoidal vibration	DIN rail mount: 3.5 mm from 5-9 Hz, 1G from 8.4 - 150 Hz Panel Mount: 7.0 mm from 5-8.4 Hz, 2G from 8.4 to 150 Hz 10 sweeps each axis, 1 octave per minute

Contamination level/overvoltage category according to IEC 61131-2

- Polution degree 2
- Overvoltage category: II

Protection class

- Protection Class II according to EN 61131-2 (Protective conductor not required)

Degree of protection

- IP20 Mechanical Protection, EN 60529
- Protects against finger contact with high voltage as tested by standard probe. External protection required for dust, dirt, water and foreign objects of < 12.5mm in diameter.

Rated voltages

Table A- 7 Rated voltages

Rated voltage	Tolerance
24 V DC	20.4 V DC to 28.8 V DC
120/230 V AC	85 V AC to 264 V AC, 47 to 63 Hz

Note

When a mechanical contact turns on output power to the S7-1200 CPU, or any digital expansion module, it sends a "1" signal to the digital outputs for approximately 50 microseconds. This could cause unexpected machine or process operation which could result in death or serious injury to personnel and/or damage to equipment. You must plan for this, especially if you are using devices which respond to short duration pulses.

Reverse voltage protection

Reverse voltage protection circuitry is provided on each terminal pair of +24 V DC power or user input power for CPUs, signal modules (SMs), and signal boards (SBs). It is still possible to damage the system by wiring different terminal pairs in opposite polarities.

Some of the 24 V DC power input ports in the S7-1200 system are interconnected, with a common logic circuit connecting multiple M terminals. For example, the following circuits are interconnected when designated as "not isolated" in the data sheets: the 24 V DC power supply of the CPU, the sensor power of the CPU, the power input for the relay coil of an SM, and the power supply for a non-isolated analog input. All non-isolated M terminals must connect to the same external reference potential.

WARNING

Connecting non-isolated M terminals to different reference potentials will cause unintended current flows that may cause damage or unpredictable operation in the PLC and any connected equipment.

Failure to comply with these guidelines could cause damage or unpredictable operation which could result in death or severe personal injury and/or property damage.

Always ensure that all non-isolated M terminals in an S7-1200 system are connected to the same reference potential.

DC Outputs

Short -circuit protection circuitry is not provided for DC outputs on CPUs, signal modules (SMs) and signal boards (SBs).

Relay electrical service life

The typical performance data estimated from sample tests is shown below. Actual performance may vary depending upon your specific application. An external protection circuit that is adapted to the load will enhance the service life of the contacts. N.C. contacts have a typical service life of about one-third that of the N.O. contact under inductive and lamp load conditions.

An external protective circuit will increase the service life of the contacts.

Table A- 8 Typical performance data

Data for selecting an actuator				
Continuous thermal current		2 A max.		
Switching capacity and life of the contacts				
	For ohmic load	Voltage	Current	Number of operating cycles (typical)
		24 V DC	2.0 A	0.1 million
		24 V DC	1.0 A	0.2 million
		24 V DC	0.5 A	1.0 million
		48 V AC	1.5 A	1.5 million
		60 V AC	1.5 A	1.5 million
		120 V AC	2.0 A	1.0 million
		120 V AC	1.0 A	1.5 million
		120 V AC	0.5 A	2.0 million
		230 V AC	2.0 A	1.0 million
		230 V AC	1.0 A	1.5 million
		230 V AC	0.5 A	2.0 million

Data for selecting an actuator				
	For inductive load (according to IEC 947-5-1 DC13/AC15)	Voltage	Current	Number of operating cycles (typical)
		24 V DC	2.0 A	0.05 million
		24 V DC	1.0 A	0.1 million
		24 V DC	0.5 A	0.5 million
		24 V AC	1.5 A	1.0 million
		48 V AC	1.5 A	1.0 million
		60 V AC	1.5 A	1.0 million
		120 V AC	2.0 A	0.7 million
		120 V AC	1.0 A	1.0 million
		120 V AC	0.5 A	1.5 million
		230 V AC	2.0 A	0.7 million
		230 V AC	1.0 A	1.0 million
		230 V AC	0.5 A	1.5 million
Activating a digital input		Possible		
Switching frequency				
	Mechanical	Max. 10 Hz		
	At ohmic load	Max. 1 Hz		
	At inductive load (according to IEC 947-5-1 DC13/AC15)	Max. 0.5 Hz		
	At lamp load	Max. 1Hz		

Internal CPU memory retention

- Lifetime of retentive data and data log data: 10 years
- Power down retentive data, Write cycle endurance: 2 million cycles
- Data log data: write cycle endurance: 500 million data log entries

Note

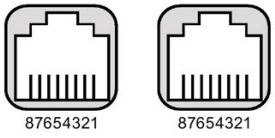
Effect of data logs on internal CPU memory

Each data log write consumes at a minimum 2 KB of memory. If your program writes small amounts of data frequently, it is consuming at least 2 KB of memory on each write. A better implementation would be to accumulate the small data items in a data block (DB), and to write the data block to the data log at less frequent intervals.

If your program writes many data log entries at a high frequency, consider using a replaceable SD memory card.

A.3 PROFINET interface X1 port pinouts

The S7-1200 CPU connects to the PROFINET network using a standard female RJ45 jack. The connector pinout depends on the CPU type.



Single-port CPUs

Single-port CPUs (CPU 1211C, CPU 1212C and CPU 1214C) have a standard Ethernet MDI pin configuration as follows:

Pin	Signal name	Description	RJ45 female jack pinout
1	TD+	Transmit data	 X1P1
2	TD-		
3	RD+	Receive data	
4	GND	Ground	
5	GND		
6	RD-	Receive data	
7	GND	Ground	
8	GND		

Dual-port CPUs

The ports of a dual-port CPU (CPU 1215C and CPU1217C) have a standard Ethernet MDI-X pin configuration as follows:

Pin	Signal name	Description	RJ45 female jack pinout
1	RD+	Receive data	 X1P1 X1P2
2	RD-		
3	TD+	Transmit data	
4	GND	Ground	
5	GND		
6	TD-	Transmit data	
7	GND	Ground	
8	GND		

Autonegotiation

If the port's configuration enables autonegotiation, the S7-1200 CPU automatically detects the cable type and swaps the transmit/receive lines, if needed. If the port's configuration disables autonegotiation, the CPU also disables this automatic swap. You configure a port's autonegotiation setting in the TIA Portal's port options dialog. This is a port-specific advanced option for the PROFINET interface (X1) of the CPU's properties. Refer to "Configuring the PROFINET port" in Section 11.2.3.4: "Configuring an IP address for a CPU in your project" (Page 795) for further information.

A.4 CPU 1211C

A.4.1 General specifications and features

Table A- 9 General specifications

Technical data	CPU 1211C AC/DC/Relay	CPU 1211C DC/DC/Relay	CPU 1211C DC/DC/DC
Article number	6ES7211-1BE40-0XB0	6ES7211-1HE40-0XB0	6ES7211-1AE40-0XB0
Dimensions W x H x D (mm)	90 x 100 x 75		
Shipping weight	420 grams	380 grams	370 grams
Power dissipation	10 W	8 W	
Current available (CM bus)	750 mA max. (5 V DC)		
Current available (24 V DC)	300 mA max. (sensor power)		
Digital input current consumption (24 V DC)	4 mA/input used		

Table A- 10 CPU features

Technical data		Description
User memory (Refer to "General technical specifications" (Page 1343), "Internal CPU memory retention".)	Work	50 Kbytes
	Load	1 Mbyte internal, expandable up to SD card size
	Retentive	10 Kbytes
Onboard digital I/O		6 inputs/4 outputs
Onboard analog I/O		2 inputs
Process image size		1024 bytes of inputs (I) /1024 bytes of outputs (Q)
Bit memory (M)		4096 bytes
Temporary (local) memory		• 16 Kbytes for startup and program cycle (including associated FBs and FCs) • 6 Kbytes for each of the other interrupt priority levels (including FBs and FCs)
Signal modules expansion		none
SB, CB, BB expansion		1 max.
Communication module expansion		3 CMs max.
High-speed counters		Up to 6 configured to use any built-in or SB inputs. Refer to "Hardware input pin assignment" (Page 566) for CPU 1211C: HSC default address assignments. 100/180 kHz (Ia.0 to Ia.5)

Technical data	Description
Pulse outputs[2]	Up to 4 configured to use any built-in or SB outputs 100 kHz (Qa.0 to Qa.3)
Pulse catch inputs	6
Time delay interrupts	4 total with 1 ms resolution
Cyclic interrupts	4 total with 1 ms resolution
Edge interrupts	6 rising and 6 falling (10 and 10 with optional signal board)
Memory card	SIMATIC memory card (optional)
Real time clock accuracy	+/- 60 seconds/month
Real time clock retention time	20 days typ./12 days min. at 40 °C (maintenance-free Super Capacitor)

1 The slower speed is applicable when the HSC is configured for quadrature mode of operation.

2 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

Table A- 11 Performance

Type of instruction		Execution speed	
		Direct addressing (I, Q and M)	DB accesses
Boolean		0.08 µs/instruction	
Move	Move_Bool	0.3 µs/instruction	1.17 µs/instruction
	Move_Word	0.137 µs/instruction	1.0 µs/instruction
	Move_Real	0.72 µs/instruction	1.0 µs/instruction
Real Math	Add Real	1.48 µs/instruction	1.78 µs/instruction

Note

Many variables affect measured times. The above performance times are for the fastest instructions in this category and error-free programs.

A.4.2 Timers, counters, and code blocks supported by CPU 1211C

Table A- 12 Blocks, timers and counters supported by CPU 1211C

Element		Description
Blocks	Type	OB, FB, FC, DB
	Size	30 Kbytes
	Quantity	Up to 1024 blocks total (OBs + FBs + FCs + DBs)
	Address range for FBs, FCs, and DBs	FB and FC: 1 to 65535 (such as FB 1 to FB 65535) DB: 1 to 59999
	Nesting depth	16 from the program cycle or startup OB 6 from any interrupt event OB[1]
	Monitoring	Status of 2 code blocks can be monitored simultaneously
OBs	Program cycle	Multiple
	Startup	Multiple
	Time-delay interrupt	4 (1 per event)
	Cyclic interrupts	4 (1 per event)
	Hardware interrupts	50 (1 per event)
	Time error interrupts	1
	Diagnostic error interrupts	1
	Pull or plug of modules	1
	Rack or station failure	1
	Time of day	Multiple
	Status	1
	Update	1
	Profile	1
	MC-Interpolator	1
	MC-Servo	1
	MC-PreServo	1
	MC-PostServo	1
Timers	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, 16 bytes per timer
Counters	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, size dependent upon count type • SInt, USInt: 3 bytes • Int, UInt: 6 bytes • DInt, UDInt: 12 bytes

[1] Safety programs use two nesting levels. The user program therefore has a nesting depth of four in safety programs.

Table A- 13 Communication

Technical data	Description
Number of ports	1
Type	Ethernet
HMI device	4
Programming device (PG)	1
Connections	• 8 connections for Open User Communication (active or passive): TSEND_C, TRCV_C, TCON, TDISCON, TSEND, and TRCV • 8 CPU-to-CPU connections (client or server) for GET/PUT data • 6 connections for dynamic allocation to either GET/PUT or Open User Communication
Data rates	10/100 Mb/s
Isolation (external signal to logic)	Transformer isolated, 1500 V AC (type test)[1]
Cable type	CAT5e shielded
Interfaces	
Number of PROFINET interfaces	1
Number of interfaces PROFIBUS	0
Interface	
Interface Hardware	
Number of ports	1
Integrated switch	No
RJ-45 (Ethernet)	Yes; X1
Protocols	
PROFINET IO controller	Yes
PROFINET IO device	Yes
SIMATIC communication	Yes
Open IE communication	Yes
Web server	Yes
Media redundancy	No
PROFINET IO controller	
Services	
PG/OP communication	Yes
S7 routing	Yes
Isochronous mode	No
Open IE communication	Yes
IRT	No
MRP	No
PROFIenergy	Yes. The S7-1200 CPU only supports the PROFIenergy entity (with I-device functionality).
Prioritized startup	Yes (max. 16 PROFINET devices)
Number of connectable I/O devices max.	16

Technical data		Description
Number of IO devices that you can connect for RT, max.		16
Of which are in line, max.		16
Number of IO devices that can be activated/ deactivated simultaneously, max.		8
Update times		The minimum value of the update time also depends on the communication component set for PROFINET IO, on the number of IO devices, and the quantity of configured user data.
With RT		
Send clock of 1 ms		1 ms to 512 ms
PROFINET IO device		
Services		
PG/OP communication		Yes
S7 routing		Yes
Isochronous mode		No
Open IE communication		Yes
IRT, supported		No
MRP, supported		No
PROFIenergy		Yes
Shared device		Yes
Number of IO controllers with shared device, max.		2
SIMATIC communication		
S7 communication, as server		Yes
S7 communication, as client		Yes
User data per job, max.		See online help (S7 communication, user data size)
Open IE communication		
TCP/IP:		Yes
	Data length, max.	8 KB
	Several passive connections per port, supported	Yes
ISO-on-TCP (RFC1006):		Yes
	Data length, max.	8 KB
UDP		Yes
	Data length, max.	1472 bytes
DHCP		No
SNMP		Yes
DCP		Yes
LLDP		Yes

[1] Ethernet port isolation is designed to limit hazard during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Table A- 14 Power supply

Technical data		**CPU 1211C AC/DC/Relay**	**CPU 1211C DC/DC/Relay**	**CPU 1211C DC/DC/DC**
Voltage range		85 to 264 V AC	20.4 V DC to 28.8 V DC	
Line frequency		47 to 63 Hz	--	
Input current	CPU only at max. load	60 mA at 120 V AC 30 mA at 240 V AC	300 mA at 24 V DC	300 mA at 24 V DC
	CPU with all expansion accessories at max. load	180 mA at 120 V AC 90 mA at 240 V AC	900 mA at 24 V DC	
Inrush current (max.)		20 A at 264 V AC	12 A at 28.8 V DC	
I^2t		0.8 A^2 s	0.5 A^2 s	
Isolation (input power to logic)		1500 V AC	Not isolated	
Ground leakage, AC line to functional earth		0.5 mA max.	--	
Hold up time (loss of power)		20 ms at 120 V AC 80 ms at 240 V AC	10 ms at 24 V DC	
Internal fuse, not user replaceable		3 A, 250 V, slow blow		

Table A- 15 Sensor power

Technical data	**CPU 1211C AC/DC/Relay**	**CPU 1211C DC/DC/Relay**	**CPU 1211C DC/DC/DC**
Voltage range	20.4 to 28.8 V DC	L+ minus 4 V DC min.	
Output current rating (max.)	300 mA (short-circuit protected)		
Maximum ripple noise (<10 MHz)	< 1 V peak to peak	Same as input line	
Isolation (CPU logic to sensor power)	Not isolated		

A.4.3 Digital inputs and outputs

Table A- 16 Digital inputs

Technical data	CPU 1211C AC/DC/Relay, CPU 1211C DC/DC/Relay, and CPU 1211C DC/DC/DC
Number of inputs	6
Type	Sink/Source (IEC Type 1 sink)
Rated voltage	24 V DC at 4 mA, nominal
Continuous permissible voltage	30 V DC, max.
Surge voltage	35 V DC for 0.5 sec.
Logic 1 signal (min.)	15 V DC at 2.5 mA
Logic 0 signal (max.)	5 V DC at 1 mA
Isolation (field side to logic)	707 V DC (type test)
Isolation groups	1
Filter times	us settings: 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0 ms settings: 0.05, 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0
HSC clock input rates (max.) (Logic 1 Level = 15 to 26 V DC)	100/80 kHz (Ia.0 to Ia.5)
Number of inputs on simultaneously	6 at 60 °C horizontal, 50 °C vertical
Cable length (meters)	500 m shielded, 300 m unshielded, 50 m shielded for HSC inputs

Table A- 17 Digital outputs

Technical data	CPU 1211C AC/DC/Relay and CPU 1211C DC/DC/Relay	CPU 1211C DC/DC/DC
Number of outputs	4	
Type	Relay, mechanical	Solid state - MOSFET (sourcing)
Voltage range	5 to 30 V DC or 5 to 250 V AC	20.4 to 28.8 V DC
Logic 1 signal at max. current	--	20 V DC min.
Logic 0 signal with 10 KΩ load	--	0.1 V DC max.
Current (max.)	2.0 A	0.5 A
Lamp load	30 W DC / 200 W AC	5 W
ON state resistance	0.2 Ω max. when new	0.6 Ω max.
Leakage current per point	--	10 µA max.
Surge current	7 A with contacts closed	8 A for 100 ms max.
Overload protection	No	
Isolation (field side to logic)	1500 V AC (coil to contact) None (coil to logic)	707 V DC (type test)
Isolation groups	1	
Inductive clamp voltage	--	L+ minus 48 V DC, 1 W dissipation
Maximum relay switching frequency	1 Hz	--

Technical data	CPU 1211C AC/DC/Relay and CPU 1211C DC/DC/Relay	CPU 1211C DC/DC/DC
Switching delay (Qa.0 to Qa.3)	10 ms max.	1.0 µs max., off to on 3.0 µs max., on to off
Pulse Train Output rate	Not recommended [1]	100 kHz (Qa.0 to Qa.3)[2], 2 Hz min.
Lifetime mechanical (no load)	10,000,000 open/close cycles	--
Lifetime contacts at rated load	100,000 open/close cycles	--
Behavior on RUN to STOP	Last value or substitute value (default value 0)	
Number of outputs on simultaneously	4 at 60 °C horizontal, 50 °C vertical	
Cable length (meters)	500 m shielded, 150 m unshielded	

1 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

2 Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) may improve pulse signal quality and noise immunity.

A.4.4 Analog inputs

Table A- 18 Analog inputs

Technical data	Description
Number of inputs	2
Type	Voltage (single-ended)
Full-scale range	0 to 10 V
Full-scale range (data word)	0 to 27648
Overshoot range	10.001 to 11.759 V
Overshoot range (data word)	27649 to 32511
Overflow range	11.760 to 11.852 V
Overflow range (data word)	32512 to 32767
Resolution	10 bits
Maximum withstand voltage	35 V DC
Smoothing	None, Weak, Medium, or Strong See the table for Step response (ms) for the analog inputs of the CPU (Page 1364).
Noise rejection	10, 50, or 60 Hz
Impedance	≥100 KΩ
Isolation (field side to logic)	None
Accuracy (25 °C / -20 to 60 °C)	3.0% / 3.5% of full-scale
Cable length (meters)	100 m, shielded twisted pair

A.4.4.1 Step response of the built-in analog inputs of the CPU

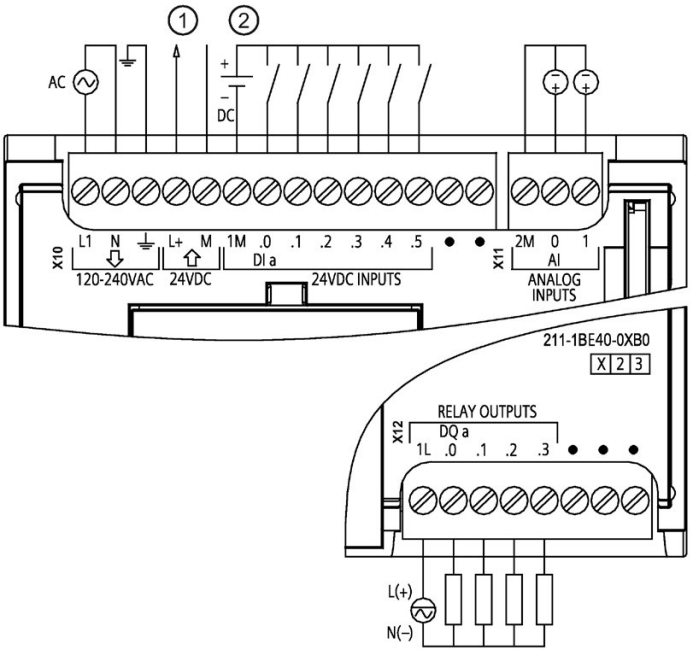
Table A- 19 Step Response (ms), 0 V to 10 V measured at 95%

Smoothing selection (sample averaging)	Rejection frequency (Integration time)		
	60 Hz	50 Hz	10 Hz
None (1 cycle): No averaging	50 ms	50 ms	100 ms
Weak (4 cycles): 4 samples	60ms	70 ms	200 ms
Medium (16 cycles): 16 samples	200 ms	240 ms	1150 ms
Strong (32 cycles): 32 samples	400 ms	480 ms	2300 ms
Sample time	**4.17 ms**	**5 ms**	**25 ms**

A.4.4.2 Sample time for the built-in analog ports of the CPU

Table A- 20 Sample time for built-in analog inputs of the CPU

Rejection frequency (Integration time selection)	Sample time
60 Hz (16.6 ms)	4.17 ms
50 Hz (20 ms)	5 ms
10 Hz (100 ms)	25 ms



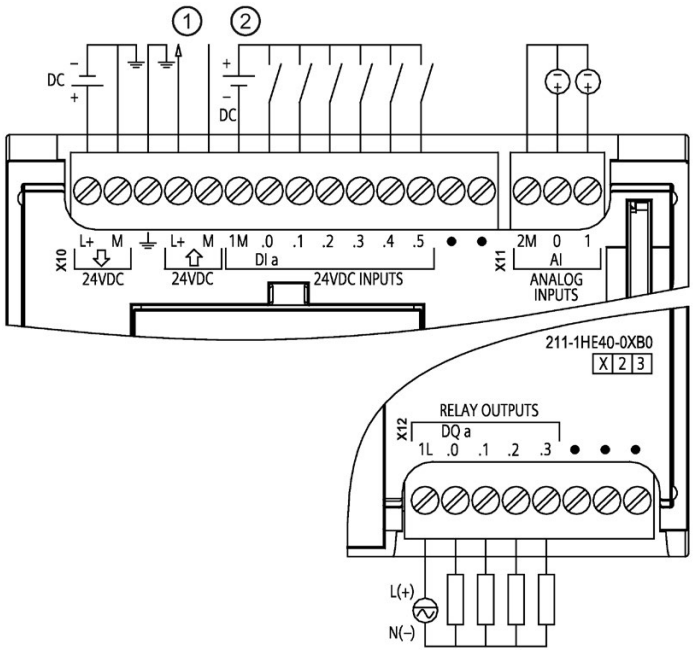
A.4.4.3 Measurement ranges of the analog inputs for voltage (CPUs)

Table A- 21 Analog input representation for voltage (CPUs)

System		Voltage Measuring Range	
Decimal	Hexadecimal	0 to 10 V	
32767	7FFF	11.852 V	Overflow
32512	7F00		
32511	7EFF	11.759 V	Overshoot range
27649	6C01		
27648	6C00	10 V	Rated range
20736	5100	7.5 V	
34	22	12 mV	
0	0	0 V	
Negative values		Negative values are not supported	

A.4.5 CPU 1211C wiring diagrams

Table A- 22 CPU 1211C AC/DC/Relay (6ES7211-1BE40-0XB0)



①	24 V DC Sensor Power Out For additional noise immunity, connect "M" to chassis ground even if not using sensor supply.
②	For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".
Note 1: X11 connectors must be gold. See Appendix C, Spare Parts for article number.	
Note 2: Either the L1 or N (L2) terminal can be connected to a voltage source up to 240 V AC. The N terminal can be considered L2 and is not required to be grounded. No polarization is required for L1 and N (L2) terminals.	
Note 3: See Device Configuration (Page 149) for information about the Ethernet port of the CPU.	

Table A- 23 Connector pin locations for CPU 1211C AC/DC/Relay (6ES7211-1BE40-0XB0)

Pin	X10	X11 (gold)	X12
1	L1 / 120-240 V AC	2 M	1L

Note

Unused analog inputs should be shorted.

A.5 CPU 1212C

A.5.1 General specifications and features

Table A- 28 General

Technical data	CPU 1212C AC/DC/Relay	CPU 1212C DC/DC/Relay	CPU 1212C DC/DC/DC
Article number	6ES7212-1BE40-0XB0	6ES7212-1HE40-0XB0	6ES7212-1AE40-0XB0
Dimensions W x H x D (mm)	90 x 100 x 75		
Shipping weight	425 grams	385 grams	370 grams
Power dissipation	11 W	9 W	
Current available (SM and CM bus)	1000 mA max. (5 V DC)		
Current available (24 V DC)	300 mA max. (sensor power)		
Digital input current consumption (24 V DC)	4 mA/input used		

Table A- 29 CPU features

Technical data		Description
User memory (Refer to "General technical specifications (Page 1343)", "Internal CPU memory retention".)	Work	75 Kbytes
	Load	2 Mbytes internal, expandable up to SD card size
	Retentive	10 Kbytes
Onboard digital I/O		8 inputs/6 outputs
Onboard analog I/O		2 inputs
Process image size		1024 bytes of inputs (I)/1024 bytes of outputs (Q)
Bit memory (M)		4096 bytes
Temporary (local) memory		• 16 Kbytes for startup and program cycle (including associated FBs and FCs) • 6 Kbytes for each of the other interrupt priority levels (including FBs and FCs)
Signal modules expansion		2 SMs max.
SB, CB, BB expansion		1 max.
Communication module expansion		3 CMs max.
High-speed counters		Up to 6 configured to use any built-in or SB inputs. Refer to "Hardware input pin assignment" (Page 566) for CPU 1212C: HSC default address assignments. • 100/180 kHz (Ia.0 to Ia.5) • 30 /120 kHz (Ia.6 to Ia.7)

Technical data	Description
Pulse outputs[2]	Up to 4 configured to use any built-in or SB outputs • 100 kHz (Qa.0 to Qa.3) • 20 kHz (Qa.4 to Qa.5)
Pulse catch inputs	8
Time delay interrupts	4 total with 1 ms resolution
Cyclic interrupts	4 total with 1 ms resolution
Edge interrupts	8 rising and 8 falling (12 and 12 with optional signal board)
Memory card	SIMATIC memory card (optional)
Real time clock accuracy	+/- 60 seconds/month
Real time clock retention time	20 days typ./12 days min. at 40 °C (maintenance-free Super Capacitor)

1 The slower speed is applicable when the HSC is configured for quadrature mode of operation.

2 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

Table A- 30 Performance

Type of instruction		Execution speed	
		Direct addressing (I, Q and M)	DB accesses
Boolean		0.08 µs/instruction	
Move	Move_Bool	0.3 µs/instruction	1.17 µs/instruction
	Move_Word	0.137 µs/instruction	1.0 µs/instruction
	Move_Real	0.72 µs/instruction	1.0 µs/instruction
Real Math	Add Real	1.48 µs/instruction	1.78 µs/instruction

Note

Many variables affect measured times. The above performance times are for the fastest instructions in this category and error-free programs.

A.5.2 Timers, counters, and code blocks supported by CPU 1212C

Table A- 31 Blocks, timers and counters supported by CPU 1212C

Element		Description
Blocks	Type	OB, FB, FC, DB
	Size	50 Kbytes
	Quantity	Up to 1024 blocks total (OBs + FBs + FCs + DBs)
	Address range for FBs, FCs, and DBs	FB and FC: 1 to 65535 (such as FB 1 to FB 65535) DB: 1 to 59999
	Nesting depth	16 from the program cycle or startup OB 6 from any interrupt event OB[1]
	Monitoring	Status of 2 code blocks can be monitored simultaneously
OBs	Program cycle	Multiple
	Startup	Multiple
	Time-delay interrupt	4 (1 per event)
	Cyclic interrupts	4 (1 per event)
	Hardware interrupts	50 (1 per event)
	Time error interrupts	1
	Diagnostic error interrupts	1
	Pull or plug of modules	1
	Rack or station failure	1
	Time of day	Multiple
	Status	1
	Update	1
	Profile	1
	MC-Interpolator	1
	MC-Servo	1
	MC-PreServo	1
	MC-PostServo	1
Timers	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, 16 bytes per timer
Counters	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, size dependent upon count type • SInt, USInt: 3 bytes • Int, UInt: 6 bytes • DInt, UDInt: 12 bytes

[1] Safety programs use two nesting levels. The user program therefore has a nesting depth of four in safety programs.

Table A- 32 Communication

Technical data	Description
Number of ports	1
Type	Ethernet
HMI device	4
Programming device (PG)	1
Connections	• 8 connections for Open User Communication (active or passive): TSEND_C, TRCV_C, TCON, TDISCON, TSEND, and TRCV • 8 CPU-to-CPU connections (client or server) for GET/PUT data • 6 connections for dynamic allocation to either GET/PUT or Open User Communication
Data rates	10/100 Mb/s
Isolation (external signal to logic)	Transformer isolated, 1500 V AC (type test)[1]
Cable type	CAT5e shielded
Interfaces	
Number of PROFINET interfaces	1
Number of interfaces PROFIBUS	0
Interface	
Interface Hardware	
Number of ports	1
Integrated switch	No
RJ-45 (Ethernet)	Yes; X1
Protocols	
PROFINET IO controller	Yes
PROFINET IO device	Yes
SIMATIC communication	Yes
Open IE communication	Yes
Web server	Yes
Media redundancy	No
PROFINET IO controller	
Services	
PG/OP communication	Yes
S7 routing	Yes
Isochronous mode	No
Open IE communication	Yes
IRT	No
MRP	No
PROFIenergy	Yes. The S7-1200 CPU only supports the PROFIenergy entity (with I-device functionality).
Prioritized startup	Yes (max. 16 PROFINET devices)
Number of connectable I/O devices max.	16
Number of IO devices that you can connect for RT, max.	16

Technical data		Description
Of which are in line, max.		16
Number of IO devices that can be activated/ deactivated simultaneously, max.		8
Update times		The minimum value of the update time also depends on the communication component set for PROFINET IO, on the number of IO devices, and the quantity of configured user data.
With RT		
Send clock of 1 ms		1 ms to 512 ms
PROFINET IO device		
Services		
PG/OP communication		Yes
S7 routing		Yes
Isochronous mode		No
Open IE communication		Yes
IRT, supported		No
MRP, supported		No
PROFIenergy		Yes
Shared device		Yes
Number of IO controllers with shared device, max.		2
SIMATIC communication		
S7 communication, as server		Yes
S7 communication, as client		Yes
User data per job, max.		See online help (S7 communication, user data size)
Open IE communication		
TCP/IP:		Yes
	Data length, max.	8 KB
	Several passive connections per port, supported	Yes
ISO-on-TCP (RFC1006):		Yes
	Data length, max.	8 KB
UDP		Yes
	Data length, max.	1472 bytes
DHCP		No
SNMP		Yes
DCP		Yes
LLDP		Yes

[1] Ethernet port isolation is designed to limit hazard during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Table A- 33 Power supply

Technical data		CPU 1212C AC/DC/Relay	CPU 1212C DC/DC/Relay	CPU 1212C DC/DC/DC
Voltage range		85 to 264 V AC	20.4 V DC to 28.8 V DC	
Line frequency		47 to 63 Hz	--	
Input current (max. load)	CPU only	80 mA at 120 V AC 40 mA at 240 V AC	400 mA at 24 V DC	
	CPU with all expansion accessories	240 mA at 120 V AC 120 mA at 240 V AC	1200 mA at 24 V DC	
Inrush current (max.)		20 A at 264 V AC	12 A at 28.8 V DC	
I^2t		0.8 A^2 s	0.5 A^2 s	
Isolation (input power to logic)		1500 V AC	Not isolated	
Ground leakage, AC line to functional earth		0.5 mA max.	--	
Hold up time (loss of power)		20 ms at 120 V AC 80 ms at 240 V AC	10 ms at 24 V DC	
Internal fuse, not user replaceable		3 A, 250 V, slow blow		

Table A- 34 Sensor power

Technical data	CPU 1212C AC/DC/Relay	CPU 1212C DC/DC/Relay	CPU 1212C DC/DC/DC
Voltage range	20.4 to 28.8 V DC	L+ minus 4 V DC min.	
Output current rating (max.)	300 mA (short-circuit protected)		
Maximum ripple noise (<10 MHz)	< 1 V peak to peak	Same as input line	
Isolation (CPU logic to sensor power)	Not isolated		

A.5.3 Digital inputs and outputs

Table A- 35 Digital inputs

Technical data	CPU 1212C AC/DC/Relay, DC/DC/Relay, and DC/DC/DC
Number of inputs	8
Type	Sink/Source (IEC Type 1 sink)
Rated voltage	24 V DC at 4 mA, nominal
Continuous permissible voltage	30 V DC, max.
Surge voltage	35 V DC for 0.5 sec.
Logic 1 signal (min.)	15 V DC at 2.5 mA
Logic 0 signal (max.)	5 V DC at 1 mA
Isolation (field side to logic)	707 V DC (type test)
Isolation groups	1
Filter times	us settings: 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0 ms settings: 0.05, 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0
HSC clock input rates (max.) (Logic 1 Level = 15 to 26 V DC)	100/80 kHz (Ia.0 to Ia.5) 30 /20 kHz (Ia.6 to Ia.7)
Number of inputs on simultaneously	4 (no adjacent points) at 60 °C horizontal or 50 °C vertical 8 at 55 °C horizontal or 45 °C vertical
Cable length (meters)	500 m shielded, 300 m unshielded, 50 m shielded for HSC inputs

Table A- 36 Digital outputs

Technical data	CPU 1212C AC/DC/Relay and DC/DC/Relay	CPU 1212C DC/DC/DC
Number of outputs	6	
Type	Relay, mechanical	Solid state - MOSFET (sourcing)
Voltage range	5 to 30 V DC or 5 to 250 V AC	20.4 to 28.8 V DC
Logic 1 signal at max. current	--	20 V DC min.
Logic 0 signal with 10 KΩ load	--	0.1 V DC max.
Current (max.)	2.0 A	0.5 A
Lamp load	30 W DC / 200 W AC	5 W
ON state resistance	0.2 Ω max. when new	0.6 Ω max.
Leakage current per point	--	10 µA max.
Surge current	7 A with contacts closed	8 A for 100 ms max.
Overload protection	No	
Isolation (field side to logic)	1500 V AC (coil to contact) None (coil to logic)	707 V DC (type test)
Isolation groups	2	1
Isolation (group-to-group)	1500 V AC[1]	--
Inductive clamp voltage	--	L+ minus 48 V DC, 1 W dissipation
Switching delay (Qa.0 to Qa.3)	10 ms max.	1.0 µs max., off to on 3.0 µs max., on to off

Technical data	CPU 1212C AC/DC/Relay and DC/DC/Relay	CPU 1212C DC/DC/DC
Switching delay (Qa.4 to Qa.5)	10 ms max.	5 µs max., off to on 20 µs max., on to off
Maximum relay switching frequency	1 Hz	--
Pulse Train Output rate	Not recommended[2]	100 kHz (Qa.0 to Qa.3)[3], 2 Hz min. 20 kHz (Qa.4 to Qa.5)[3]
Lifetime mechanical (no load)	10,000,000 open/close cycles	--
Lifetime contacts at rated load	100,000 open/close cycles	--
Behavior on RUN to STOP	Last value or substitute value (default value 0)	Last value or substitute value (default value 0)
Number of outputs on simultaneously	3 (no adjacent points) at 60 °C horizontal or 50 °C vertical 6 at 55 °C horizontal, or 45 °C vertical	
Cable length (meters)	500 m shielded, 150 m unshielded	

1 Relay group-to-group isolation separates line voltage from SELV/PELV and separates different phases up to 250 V AC line to ground.

2 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

3 Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) may improve pulse signal quality and noise immunity.

A.5.4 Analog inputs

Table A- 37 Analog inputs

Technical data	Description
Number of inputs	2
Type	Voltage (single-ended)
Full-scale range	0 to 10 V
Full-scale range (data word)	0 to 27648
Overshoot range	10.001 to 11.759 V
Overshoot range (data word)	27649 to 32511
Overflow range	11.760 to 11.852 V
Overflow range (data word)	32512 to 32767
Resolution	10 bits
Maximum withstand voltage	35 V DC
Smoothing	None, Weak, Medium, or Strong See the table for Step response (ms) for the analog inputs of the CPU (Page 1377).
Noise rejection	10, 50, or 60 Hz
Impedance	≥100 KΩ
Isolation (field side to logic)	None
Accuracy (25 °C / -20 to 60 °C)	3.0% / 3.5% of full-scale
Cable length (meters)	100 m, shielded twisted pair

A.5.4.1 Step response of the built-in analog inputs of the CPU

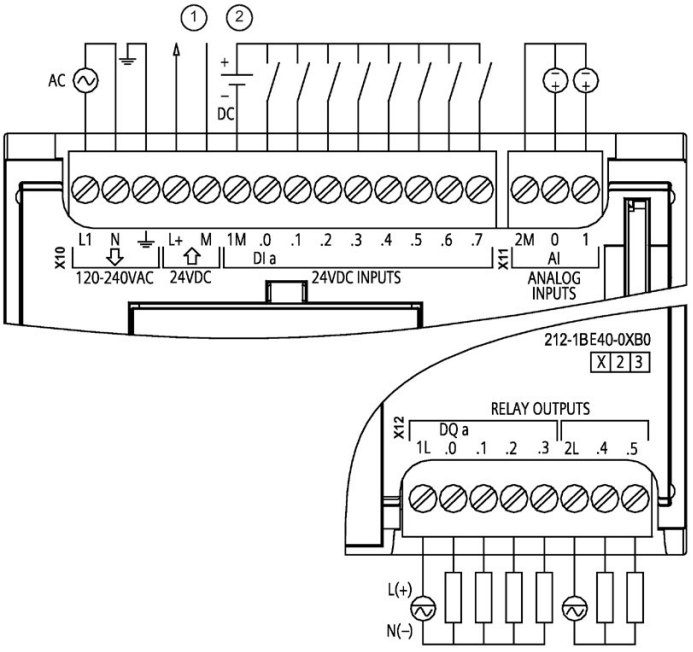
Table A- 38 Step Response (ms), 0 V to 10 V measured at 95%

Smoothing selection (sample averaging)	Rejection frequency (Integration time)		
	60 Hz	50 Hz	10 Hz
None (1 cycle): No averaging	50 ms	50 ms	100 ms
Weak (4 cycles): 4 samples	60ms	70 ms	200 ms
Medium (16 cycles): 16 samples	200 ms	240 ms	1150 ms
Strong (32 cycles): 32 samples	400 ms	480 ms	2300 ms
Sample time	**4.17 ms**	**5 ms**	**25 ms**

A.5.4.2 Sample time for the built-in analog ports of the CPU

Table A- 39 Sample time for built-in analog inputs of the CPU

Rejection frequency (Integration time selection)	Sample time
60 Hz (16.6 ms)	4.17 ms
50 Hz (20 ms)	5 ms
10 Hz (100 ms)	25 ms



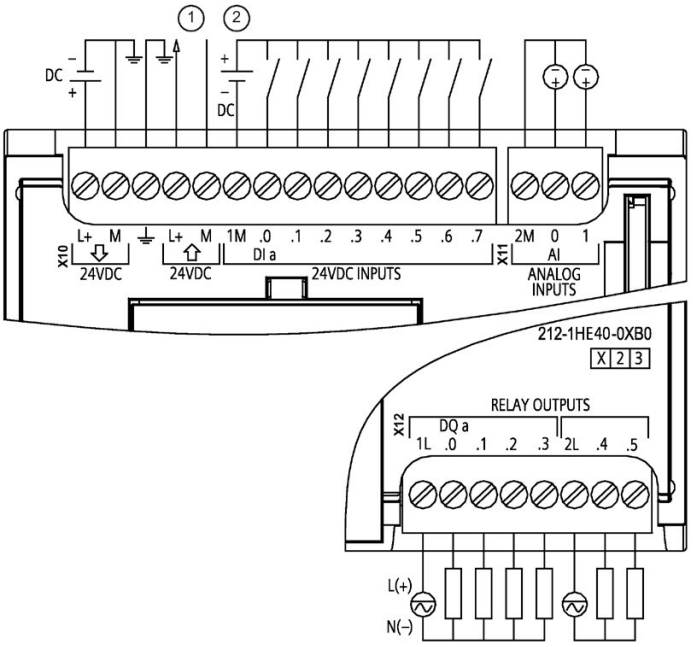
A.5.4.3 Measurement ranges of the analog inputs for voltage (CPUs)

Table A- 40 Analog input representation for voltage (CPUs)

System		Voltage Measuring Range	
Decimal	Hexadecimal	0 to 10 V	
32767	7FFF	11.852 V	Overflow
32512	7F00		
32511	7EFF	11.759 V	Overshoot range
27649	6C01		
27648	6C00	10 V	Rated range
20736	5100	7.5 V	
34	22	12 mV	
0	0	0 V	
Negative values		Negative values are not supported	

A.5.5 CPU 1212C wiring diagrams

Table A- 41 CPU 1212C AC/DC/Relay (6ES7212-1BE40-0XB0)



①	24 V DC Sensor Power Out For additional noise immunity, connect "M" to chassis ground even if not using sensor supply.
②	For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".
Note 1: X11 connectors must be gold. See Appendix C, Spare Parts for article number.	
Note 2: Either the L1 or N (L2) terminal can be connected to a voltage source up to 240 V AC. The N terminal can be considered L2 and is not required to be grounded. No polarization is required for L1 and N (L2) terminals.	
Note 3: See Device Configuration (Page 149) for information about the Ethernet port of the CPU.	

Table A- 42 Connector pin locations for CPU 1212C AC/DC/Relay (6ES7212-1BE40-0XB0)

Pin	X10	X11 (gold)	X12
1	L1 / 120-240 V AC	2 M	1L

Note

Unused analog inputs should be shorted.

A.6 CPU 1214C

A.6.1 General specifications and features

Table A- 47 General

Technical data	CPU 1214C AC/DC/Relay	CPU 1214C DC/DC/Relay	CPU 1214C DC/DC/DC
Article number	6ES7214-1BG40-0XB0	6ES7214-1HG40-0XB0	6ES7214-1AG40-0XB0
Dimensions W x H x D (mm)	110 x 100 x 75		
Shipping weight	475 grams	435 grams	415 grams
Power dissipation	14 W	12 W	
Current available (SM and CM bus)	1600 mA max. (5 V DC)		
Current available (24 V DC)	400 mA max. (sensor power)		
Digital input current consumption (24 V DC)	4 mA/input used		

Table A- 48 CPU features

Technical data		Description
User memory (Refer to "General technical specifications", (Page 1343) "Internal CPU memory retention".)	Work	100 Kbytes
	Load	4 Mbytes internal, expandable up to SD card size
	Retentive	10 Kbytes
Onboard digital I/O		14 inputs/10 outputs
Onboard analog I/O		2 inputs
Process image size		1024 bytes of inputs (I)/1024 bytes of outputs (Q)
Bit memory (M)		8192 bytes
Temporary (local) memory		• 16 Kbytes for startup and program cycle (including associated FBs and FCs) • 6 Kbytes for each of the other interrupt priority levels (including FBs and FCs)
Signal modules expansion		8 SMs max.
SB, CB, BB expansion		1 max.
Communication module expansion		3 CMs max.
High-speed counters		Up to 6 configured to use any built-in or SB inputs. Refer to "Hardware input pin assignment" (Page 566) for CPU 1214C: HSC default address assignments. • 100/180 kHz (Ia.0 to Ia.5) • 30/120 kHz (Ia.6 to Ib.5)

Technical data	Description
Pulse outputs[2]	Up to 4 configured to use any built-in or SB outputs • 100 kHz (Qa.0 to Qa.3) • 20 kHz (Qa.4 to Qb.1)
Pulse catch inputs	14
Time delay interrupts	4 total with 1 ms resolution
Cyclic interrupts	4 total with 1 ms resolution
Edge interrupts	12 rising and 12 falling (16 and 16 with optional signal board)
Memory card	SIMATIC memory card (optional)
Real time clock accuracy	+/- 60 seconds/month
Real time clock retention time	20 days typ./12 days min. at 40 °C (maintenance-free Super Capacitor)

1 The slower speed is applicable when the HSC is configured for quadrature mode of operation.

2 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

Table A- 49 Performance

Type of instruction		Execution speed	
		Direct addressing (I, Q and M)	DB accesses
Boolean		0.08 µs/instruction	
Move	Move_Bool	0.3 µs/instruction	1.17 µs/instruction
	Move_Word	0.137 µs/instruction	1.0 µs/instruction
	Move_Real	0.72 µs/instruction	1.0 µs/instruction
Real Math	Add Real	1.48 µs/instruction	1.78 µs/instruction

Note

Many variables affect measured times. The above performance times are for the fastest instructions in this category and error-free programs.

A.6.2 Timers, counters and code blocks supported by CPU 1214C

Table A- 50 Blocks, timers and counters supported by CPU 1214C

Element		Description
Blocks	Type	OB, FB, FC, DB
	Size	64 Kbytes
	Quantity	Up to 1024 blocks total (OBs + FBs + FCs + DBs)
	Address range for FBs, FCs, and DBs	FB and FC: 1 to 65535 (such as FB 1 to FB 65535) DB: 1 to 59999
	Nesting depth	16 from the program cycle or startup OB 6 from any interrupt event OB[1]
	Monitoring	Status of 2 code blocks can be monitored simultaneously
OBs	Program cycle	Multiple
	Startup	Multiple
	Time-delay interrupts	4 (1 per event)
	Cyclic interrupts	4 (1 per event)
	Hardware interrupts	50 (1 per event)
	Time error interrupts	1
	Diagnostic error interrupts	1
	Pull or plug of modules	1
	Rack or station failure	1
	Time of day	Multiple
	Status	1
	Update	1
	Profile	1
	MC-Interpolator	1
	MC-Servo	1
	MC-PreServo	1
	MC-PostServo	1
Timers	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, 16 bytes per timer
Counters	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, size dependent upon count type • SInt, USInt: 3 bytes • Int, UInt: 6 bytes • DInt, UDInt: 12 bytes

[1] Safety programs use two nesting levels. The user program therefore has a nesting depth of four in safety programs.

Table A- 51 Communication

Technical data	Description
Number of ports	1
Type	Ethernet
HMI device	4
Programming device (PG)	1
Connections	• 8 connections for Open User Communication (active or passive): TSEND_C, TRCV_C, TCON, TDISCON, TSEND, and TRCV • 8 CPU-to-CPU connections (client or server) for GET/PUT data • 6 connections for dynamic allocation to either GET/PUT or Open User Communication
Data rates	10/100 Mb/s
Isolation (external signal to logic)	Transformer isolated, 1500 V AC (type test)[1]
Cable type	CAT5e shielded

Maximum ripple noise (<10 MHz)	< 1 V peak to peak	Same as input line	
Isolation (CPU logic to sensor power)	Not isolated		

A.6.3 Digital inputs and outputs

Table A- 54 Digital inputs

Technical data	CPU 1214C AC/DC/Relay	CPU 1214C DC/DC/Relay	CPU 1214C DC/DC/DC
Number of inputs	14		
Type	Sink/Source (IEC Type 1 sink)		
Rated voltage	24 V DC at 4 mA, nominal		
Continuous permissible voltage	30 V DC, max.		
Surge voltage	35 V DC for 0.5 sec.		
Logic 1 signal (min.)	15 V DC at 2.5 mA		
Logic 0 signal (max.)	5 V DC at 1 mA		
Isolation (field side to logic)	707 V DC (type test)		
Isolation groups	1		
Filter times	us settings: 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0 ms settings: 0.05, 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0		
HSC clock input rates (max.) (Logic 1 Level = 15 to 26 V DC)	100/80 kHz (Ia.0 to Ia.5) 30/20 kHz (Ia.6 to Ib.5		
Number of inputs on simultaneously	• 7 (no adjacent points) at 60 °C horizontal or 50 °C vertical • 14 at 55 °C horizontal or 45 °C vertical		
Cable length (meters)	500 m shielded, 300 m unshielded, 50 m shielded for HSC inputs		

Table A- 55 Digital outputs

Technical data	CPU 1214C AC/DC/Relay and DC/DC/Relay	CPU 1214C DC/DC/DC
Number of outputs	10	
Type	Relay, mechanical	Solid state - MOSFET (sourcing)
Voltage range	5 to 30 V DC or 5 to 250 V AC	20.4 to 28.8 V DC
Logic 1 signal at max. current	--	20 V DC min.
Logic 0 signal with 10 KΩ load	--	0.1 V DC max.
Current (max.)	2.0 A	0.5 A
Lamp load	30 W DC / 200 W AC	5 W
ON state resistance	0.2 Ω max. when new	0.6 Ω max.
Leakage current per point	--	10 µA max.
Surge current	7 A with contacts closed	8 A for 100 ms max.
Overload protection	No	
Isolation (field side to logic)	1500 V AC (coil to contact) None (coil to logic)	707 V DC (type test)
Isolation groups	2	1
Isolation (group-to-group)	1500 V AC[1]	--
Inductive clamp voltage	--	L+ minus 48 V DC, 1 W dissipation
Switching delay (Qa.0 to Qa.3)	10 ms max.	1.0 µs max., off to on 3.0 µs max., on to off
Switching delay (Qa.4 to Qb.1)	10 ms max.	5 µs max., off to on 20 µs max., on to off
Maximum relay switching frequency	1 Hz	--
Pulse Train Output rate	Not recommended [2]	100 kHz (Qa.0 to Qa.3)[3], 2 Hz min. 20 kHz (Qa.4 to Qb.1)[3]
Lifetime mechanical (no load)	10,000,000 open/close cycles	--
Lifetime contacts at rated load	100,000 open/close cycles	--
Behavior on RUN to STOP	Last value or substitute value (default value 0)	
Number of outputs on simultaneously	• 5 (no adjacent points) at 60 °C horizontal or 50 °C vertical • 10 at 55 °C horizontal or 45 °C vertical	
Cable length (meters)	500 m shielded, 150 m unshielded	

1 Relay group-to-group isolation separates line voltage from SELV/PELV and separates different phases up to 250 V AC line to ground.

2 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

3 Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) may improve pulse signal quality and noise immunity.

A.6.4 Analog inputs

Table A- 56 Analog inputs

Technical data	Description
Number of inputs	2
Type	Voltage (single-ended)
Full-scale range	0 to 10 V
Full-scale range (data word)	0 to 27648
Overshoot range	10.001 to 11.759 V
Overshoot range (data word)	27649 to 32511
Overflow range	11.760 to 11.852 V
Overflow range (data word)	32512 to 32767
Resolution	10 bits
Maximum withstand voltage	35 V DC
Smoothing	None, Weak, Medium, or Strong See the table for Step response (ms) for the analog inputs of the CPU (Page 1390).
Noise rejection	10, 50, or 60 Hz
Impedance	≥100 KΩ
Isolation (field side to logic)	None
Accuracy (25 °C / -20 to 60 °C)	3.0% / 3.5% of full-scale
Cable length (meters)	100 m, shielded twisted pair

A.6.4.1 Step response of the built-in analog inputs of the CPU

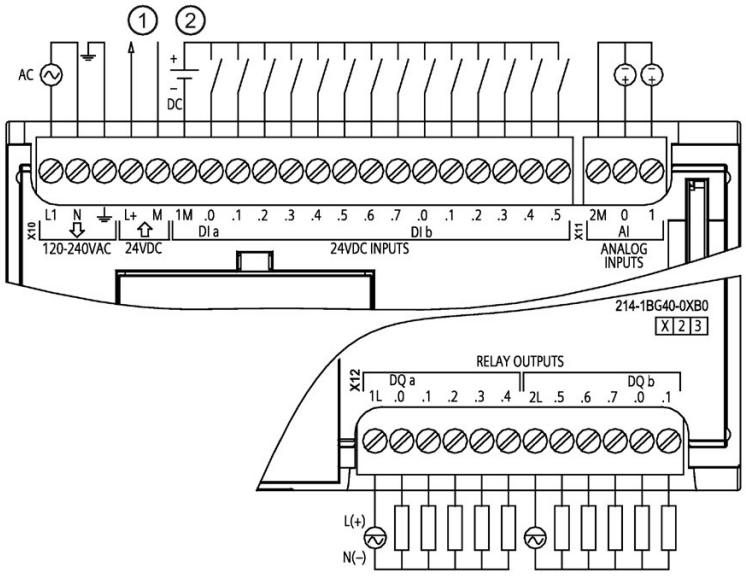
Table A- 57 Step Response (ms), 0 V to 10 V measured at 95%

Smoothing selection (sample averaging)	Rejection frequency (Integration time)		
	60 Hz	50 Hz	10 Hz
None (1 cycle): No averaging	50 ms	50 ms	100 ms
Weak (4 cycles): 4 samples	60ms	70 ms	200 ms
Medium (16 cycles): 16 samples	200 ms	240 ms	1150 ms
Strong (32 cycles): 32 samples	400 ms	480 ms	2300 ms
Sample time	**4.17 ms**	**5 ms**	**25 ms**

A.6.4.2 Sample time for the built-in analog ports of the CPU

Table A- 58 Sample time for built-in analog inputs of the CPU

Rejection frequency (Integration time selection)	Sample time
60 Hz (16.6 ms)	4.17 ms
50 Hz (20 ms)	5 ms
10 Hz (100 ms)	25 ms



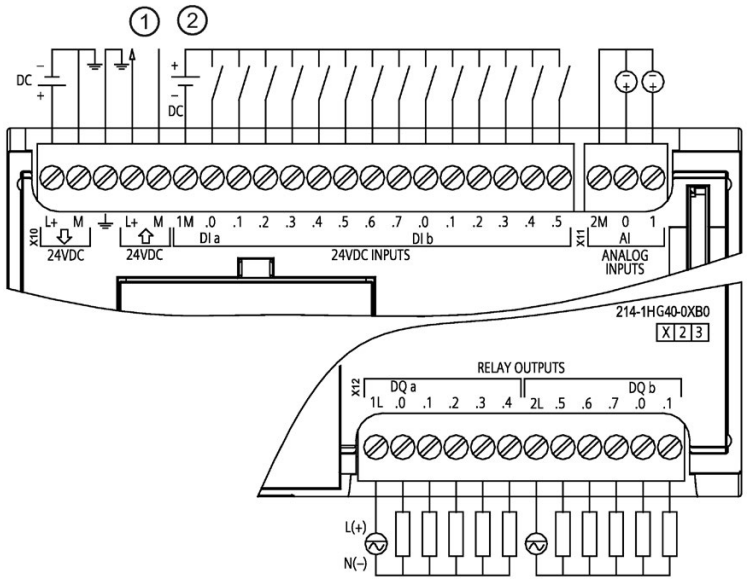
A.6.4.3 Measurement ranges of the analog inputs for voltage (CPUs)

Table A- 59 Analog input representation for voltage (CPUs)

System		Voltage Measuring Range	
Decimal	Hexadecimal	0 to 10 V	
32767	7FFF	11.852 V	Overflow
32512	7F00		
32511	7EFF	11.759 V	Overshoot range
27649	6C01		
27648	6C00	10 V	Rated range
20736	5100	7.5 V	
34	22	12 mV	
0	0	0 V	
Negative values		Negative values are not supported	

A.6.5 CPU 1214C wiring diagrams

Table A- 60 CPU 1214C AC/DC/Relay (6ES7214-1BG40-0XB0)



①	24 V DC Sensor Power Out For additional noise immunity, connect "M" to chassis ground even if not using sensor supply.
②	For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".
Note 1: X11 connectors must be gold. See Appendix C, Spare Parts for article number.	
Note 2: Either the L1 or N (L2) terminal can be connected to a voltage source up to 240 V AC. The N terminal can be considered L2 and is not required to be grounded. No polarization is required for L1 and N (L2) terminals.	
Note 3: See Device Configuratio (Page 149)n for information about the Ethernet port of the CPU.	

Table A- 61 Connector pin locations for CPU 1214C AC/DC/Relay (6ES7214-1BG40-0XB0)

Pin	X10	X11 (gold)	X12
1	L1 / 120-240 V AC	2 M	1L

Unused analog inputs should be shorted.

A.7 CPU 1215C

A.7.1 General specifications and features

Table A- 66 General

Technical data	CPU 1215C AC/DC/Relay	CPU 1215C DC/DC/Relay	CPU 1215C DC/DC/DC
Article number	6ES7215-1BG40-0XB0	6ES7215-1HG40-0XB0	6ES7215-1AG40-0XB0
Dimensions W x H x D (mm)	130 x 100 x 75		
Shipping weight	585 grams	550 grams	520 grams
Power dissipation	14 W	12 W	
Current available (SM and CM bus)	1600 mA max. (5 V DC)		
Current available (24 V DC)	400 mA max. (sensor power)		
Digital input current consumption (24 V DC)	4 mA/input used		

Table A- 67 CPU features

Technical data		Description
User memory (Refer to "General technical specifications (Page 1343)", "Internal CPU memory retention".)	Work	125 Kbytes
	Load	4 Mbytes, internal, expandable up to SD card size
	Retentive	10 Kbytes
Onboard digital I/O		14 inputs/10 outputs
Onboard analog I/O		2 inputs/2 outputs
Process image size		1024 bytes of inputs (I)/1024 bytes of outputs (Q)
Bit memory (M)		8192 bytes
Temporary (local) memory		• 16 Kbytes for startup and program cycle (including associated FBs and FCs) • 6 Kbytes for each of the other interrupt priority levels (including FBs and FCs)
Signal modules expansion		8 SMs max.
SB, CB, BB expansion		1 max.
Communication module expansion		3 CMs max.
High-speed counters		Up to 6 configured to use any built-in or SB inputs. Refer to "Hardware input pin assignment" (Page 566) for CPU 1215C: HSC default address assignments. • 100/180 kHz (Ia.0 to Ia.5) • 30/120 kHz (Ia.6 to Ib.5)

Technical data	Description
Pulse outputs[2]	Up to 4 configured to use any built-in or SB outputs • 100 kHz (Qa.0 to Qa.3) • 20 kHz (Qa.4 to Qb.1)
Pulse catch inputs	14
Time delay interrupts	4 total with 1 ms resolution
Cyclic interrupts	4 total with 1 ms resolution
Edge interrupts	12 rising and 12 falling (16 and 16 with optional signal board)
Memory card	SIMATIC memory card (optional)
Real time clock accuracy	+/- 60 seconds/month
Real time clock retention time	20 days typ./12 days min. at 40 °C (maintenance-free Super Capacitor)

1 The slower speed is applicable when the HSC is configured for quadrature mode of operation.

2 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

Table A- 68 Performance

Type of instruction		Execution speed	
		Direct addressing (I, Q and M)	DB accesses
Boolean		0.08 µs/instruction	
Move	Move_Bool	0.3 µs/instruction	1.17 µs/instruction
	Move_Word	0.137 µs/instruction	1.0 µs/instruction
	Move_Real	0.72 µs/instruction	1.0 µs/instruction
Real Math	Add Real	1.48 µs/instruction	1.78 µs/instruction

Note

Many variables affect measured times. The above performance times are for the fastest instructions in this category and error-free programs.

A.7.2 Timers, counters and code blocks supported by CPU 1215C

Table A- 69 Blocks, timers and counters supported by CPU 1215C

Element		Description
Blocks	Type	OB, FB, FC, DB
	Size	64 Kbytes
	Quantity	Up to 1024 blocks total (OBs + FBs + FCs + DBs)
	Address range for FBs, FCs, and DBs	FB and FC: 1 to 65535 (such as FB 1 to FB 65535) DB: 1 to 59999
	Nesting depth	16 from the program cycle or startup OB 6 from any interrupt event OB[1]
	Monitoring	Status of 2 code blocks can be monitored simultaneously
OBs	Program cycle	Multiple
	Startup	Multiple
	Time-delay interrupts	4 (1 per event)
	Cyclic interrupts	4 (1 per event)
	Hardware interrupts	50 (1 per event)
	Time error interrupts	1
	Diagnostic error interrupts	1
	Pull or plug of modules	1
	Rack or station failure	1
	Time of day	Multiple
	Status	1
	Update	1
	Profile	1
	MC-Interpolator	1
	MC-Servo	1
	MC-PreServo	1
	MC-PostServo	1
Timers	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, 16 bytes per timer
Counters	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, size dependent upon count type • SInt, USInt: 3 bytes • Int, UInt: 6 bytes • DInt, UDInt: 12 bytes

[1] Safety programs use two nesting levels. The user program therefore has a nesting depth of four in safety programs.

Table A- 70 Communication

Technical data	Description
Number of ports	2
Type	Ethernet
HMI device	4
Programming device (PG)	1
Connections	• 8 connections for Open User Communication (active or passive): TSEND_C, TRCV_C, TCON, TDISCON, TSEND, and TRCV • 8 CPU-to-CPU connections (client or server) for GET/PUT data • 6 connections for dynamic allocation to either GET/PUT or Open User Communication
Data rates	10/100 Mb/s
Isolation (external signal to logic)	Transformer isolated, 1500 V AC (type test)[1]
Cable type	CAT5e shielded
Interfaces	
Number of PROFINET interfaces	1
Number of interfaces PROFIBUS	0
Interface	
Interface hardware	
Number of ports	2
Integrated switch	Yes
RJ-45 (Ethernet)	Yes; X1
Protocols	
PROFINET IO controller	Yes
PROFINET IO device	Yes
SIMATIC communication	Yes
Open IE communication	Yes
Web server	Yes
Media redundancy	Yes
PROFINET IO controller	
Services	
PG/OP communication	Yes
S7 routing	Yes
Isochronous mode	No
Open IE communication	Yes
IRT	No
MRP	Yes as MRP client
PROFIenergy	Yes. The S7-1200 CPU only supports the PROFIenergy entity (with I-device functionality).
Prioritized startup	Yes (max. 16 PROFINET devices)
Number of connectable I/O devices max.	16
Number of IO devices that you can connect for RT, max.	16

Technical data		Description
Of which are in line, max.		16
Number of IO devices that can be activated/ deactivated simultaneously, max.		8
Update times		The minimum value of the update time also depends on the communication component set for PROFINET IO, on the number of IO devices, and the quantity of configured user data.
With RT		
Send clock of 1 ms		1 ms to 512 ms
PROFINET IO device		
Services		
PG/OP communication		Yes
S7 routing		Yes
Isochronous mode		No
Open IE communication		Yes
IRT, supported		No
MRP, supported		Yes
PROFIenergy		Yes
Shared device		Yes
Number of IO controllers with shared device, max.		2
SIMATIC communication		
S7 communication, as server		Yes
S7 communication, as client		Yes
User data per job, max.		See online help (S7 communication, user data size)
Open IE communication		
TCP/IP:		Yes
	Data length, max.	8 KB
	Several passive connections per port, supported	Yes
ISO-on-TCP (RFC1006):		Yes
	Data length, max.	8 KB
UDP:		Yes
	Data length, max.	1472 bytes
DHCP		No
SNMP		Yes
DCP		Yes
LLDP		Yes

[1] Ethernet port isolation is designed to limit hazard during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Table A- 71 Power supply

Technical data		CPU 1215C AC/DC/Relay	CPU 1215C DC/DC/Relay	CPU 1215C DC/DC/DC
Voltage range		85 to 264 V AC	20.4 V DC to 28.8 V DC	
Line frequency		47 to 63 Hz	--	
Input current (max. load)	CPU only	100 mA at 120 V AC 50 mA at 240 V AC	500 mA at 24 V DC	
	CPU with all expansion accessories	300 mA at 120 V AC 150 mA at 240 V AC	1500 mA at 24 V DC	
Inrush current (max.)		20 A at 264 V AC	12 A at 28.8 V DC	
I^2t		0.8 A^2 s	0.5 A^2 s	
Isolation (input power to logic)		1500 V AC	Not isolated	
Ground leakage, AC line to functional earth		0.5 mA max.	-	
Hold up time (loss of power)		20 ms at 120 V AC 80 ms at 240 V AC	10 ms at 24 V DC	
Internal fuse, not user replaceable		3 A, 250 V, slow blow		

Table A- 72 Sensor power

Technical data	CPU 1215C AC/DC/Relay	CPU 1215C DC/DC/Relay	CPU 1215C DC/DC/DC
Voltage range	20.4 to 28.8 V DC	L+ minus 4 V DC min.	
Output current rating (max.)	400 mA (short-circuit protected)		
Maximum ripple noise (<10 MHz)	< 1 V peak to peak	Same as input line	
Isolation (CPU logic to sensor power)	Not isolated		

A.7.3 Digital inputs and outputs

Table A- 73 Digital inputs

Technical data	CPU 1215C AC/DC/Relay	CPU 1215C DC/DC/Relay	CPU 1215C DC/DC/DC
Number of inputs	14		
Type	Sink/Source (IEC Type 1 sink)		
Rated voltage	24 V DC at 4 mA, nominal		
Continuous permissible voltage	30 V DC, max.		
Surge voltage	35 V DC for 0.5 sec.		
Logic 1 signal (min.)	15 V DC at 2.5 mA		
Logic 0 signal (max.)	5 V DC at 1 mA		
Isolation (field side to logic)	707 V DC (type test)		
Isolation groups	1		
Filter times	us settings: 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0 ms settings: 0.05, 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0		
HSC clock input rates (max.) (Logic 1 Level = 15 to 26 V DC)	100/80 kHz (Ia.0 to Ia.5) 30/20 kHz (Ia.6 to Ib.5)		
Number of inputs on simultaneously	• 7 (no adjacent points) at 60 °C horizontal or 50 °C vertical • 14 at 55 °C horizontal or 45 °C vertical		
Cable length (meters)	500 m shielded, 300 m unshielded, 50 m shielded for HSC inputs		

Table A- 74 Digital outputs

Technical data	CPU 1215C AC/DC/Relay and CPU 1215C DC/DC/Relay	CPU 1215C DC/DC/DC
Number of outputs	10	
Type	Relay, mechanical	Solid state - MOSFET (sourcing)
Voltage range	5 to 30 V DC or 5 to 250 V AC	20.4 to 28.8 V DC
Logic 1 signal at max. current	--	20 V DC min.
Logic 0 signal with 10 KΩ load	--	0.1 V DC max.
Current (max.)	2.0 A	0.5 A
Lamp load	30 W DC / 200 W AC	5 W
ON state resistance	0.2 Ω max. when new	0.6 Ω max.
Leakage current per point	--	10 µA max.
Surge current	7 A with contacts closed	8 A for 100 ms max.
Overload protection	No	
Isolation (field side to logic)	1500 V AC (coil to contact) None (coil to logic)	707 V DC (type test)
Isolation groups	2	1
Isolation (group-to-group)	1500 V AC[1]	--
Inductive clamp voltage	--	L+ minus 48 V DC, 1 W dissipation
Switching delay (Qa.0 to Qa.3)	10 ms max.	1.0 µs max., off to on 3.0 µs max., on to off
Switching delay (Qa.4 to Qb.1)	10 ms max.	5 µs max., off to on 20 µs max., on to off
Maximum relay switching frequency	1 Hz	--
Pulse Train Output rate	Not recommended [2]	100 kHz (Qa.0 to Qa.3)[3], 2 Hz min. 20 kHz (Qa.4 to Qb.1)[3]
Lifetime mechanical (no load)	10,000,000 open/close cycles	--
Lifetime contacts at rated load	100,000 open/close cycles	--
Behavior on RUN to STOP	Last value or substitute value (default value 0)	
Number of outputs on simultaneously	• 5 (no adjacent points) at 60 °C horizontal or 50 °C vertical • 10 at 55 °C horizontal or 45 °C vertical	
Cable length (meters)	500 m shielded, 150 m unshielded	

1 Relay group-to-group isolation separates line voltage from SELV/PELV and separates different phases up to 250 V AC line to ground.

2 For CPU models with relay outputs, you must install a digital signal board (SB) to use the pulse outputs.

3 Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) may improve pulse signal quality and noise immunity.

A.7.4 Analog inputs and outputs

Table A- 75 Analog inputs

Technical data	Description
Number of inputs	2
Type	Voltage (single-ended)
Full-scale range	0 to 10 V
Full-scale range (data word)	0 to 27648
Overshoot range	10.001 to 11.759 V
Overshoot range (data word)	27649 to 32511
Overflow range	11.760 to 11.852 V
Overflow range (data word)	32512 to 32767
Resolution	10 bits
Maximum withstand voltage	35 V DC
Smoothing	None, Weak, Medium, or Strong See the table for Step response (ms) for the analog inputs of the CPU (Page 1404).
Noise rejection	10, 50, or 60 Hz
Impedance	≥100 KΩ
Isolation (field side to logic)	None
Accuracy (25 °C / -20 to 60 °C)	3.0% / 3.5% of full-scale
Cable length (meters)	100 m, shielded twisted pair

A.7.4.1 Step response of built-in analog inputs of the CPU

Table A- 76 Step Response (ms), 0 V to 10 V measured at 95%

Smoothing selection (sample averaging)	Rejection frequency (Integration time)		
	60 Hz	50 Hz	10 Hz
None (1 cycle): No averaging	50 ms	50 ms	100 ms
Weak (4 cycles): 4 samples	60ms	70 ms	200 ms
Medium (16 cycles): 16 samples	200 ms	240 ms	1150 ms
Strong (32 cycles): 32 samples	400 ms	480 ms	2300 ms
Sample time	**4.17 ms**	**5 ms**	**25 ms**

A.7.4.2 Sample time for the built-in analog ports of the CPU

Table A- 77 Sample time for built-in analog inputs of the CPU

Rejection frequency (Integration time selection)	Sample time
60 Hz (16.6 ms)	4.17 ms
50 Hz (20 ms)	5 ms
10 Hz (100 ms)	25 ms

A.7.4.3 Measurement ranges of the analog inputs for voltage (CPUs)

Table A- 78 Analog input representation for voltage (CPUs)

System		Voltage Measuring Range	
Decimal	Hexadecimal	0 to 10 V	
32767	7FFF	11.852 V	Overflow
32512	7F00		
32511	7EFF	11.759 V	Overshoot range
27649	6C01		
27648	6C00	10 V	Rated range
20736	5100	7.5 V	
34	22	12 mV	
0	0	0 V	
Negative values		Negative values are not supported	

A.7.4.4 Analog output specifications

Table A- 79 Analog outputs

Technical data	Description
Number of outputs	2
Type	Current
Full-scale range	0 to 20 mA
Full-scale range (data word)	0 to 27648
Overshoot range	20.01 to 23.52 mA
Overshoot range (data word)	27649 to 32511
Overflow range	see footnote [1]
Overflow range data word	32512 to 32767
Resolution	10 bits
Output drive impedance	≤500 Ω max.
Isolation (field side to logic)	None
Accuracy (25 °C / -20 to 60 °C)	3.0% / 3.5% of full-scale
Settling time	2 ms
Cable length (meters)	100 m, shielded twisted pair

[1] In an overflow condition, analog outputs will behave according to the device configuration properties settings. In the "Reaction to CPU STOP" parameter, select either: "Use substitute value" or "Keep last value".

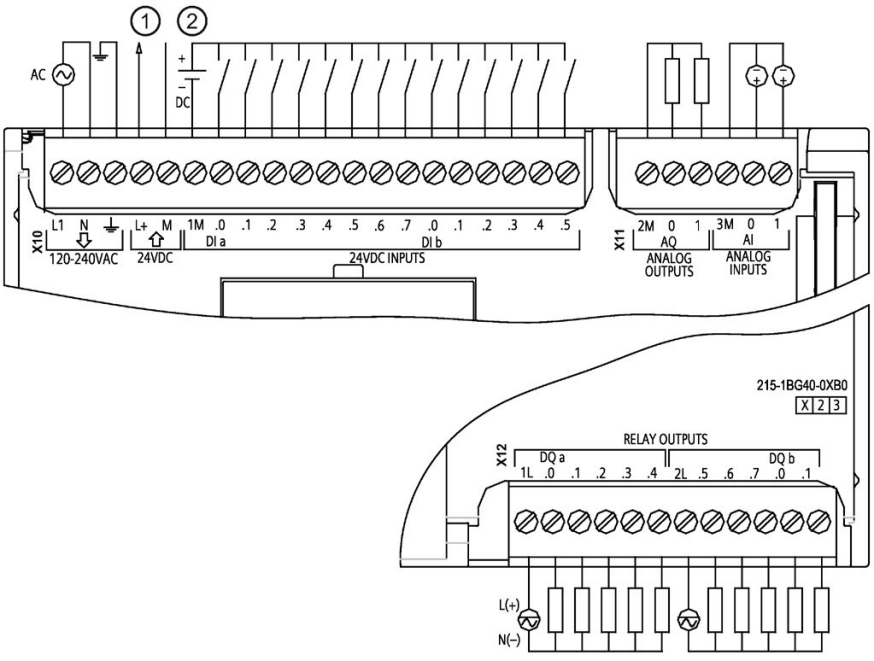

Table A- 80 Analog output representation for current (CPU 1215C and CPU 1217C)

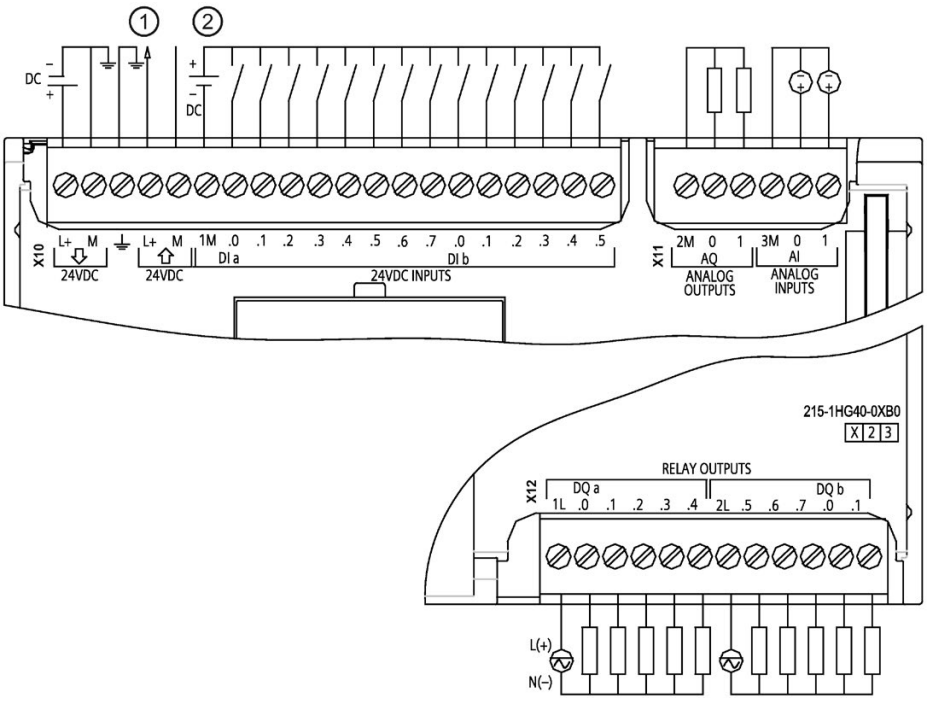
System		Current output range	
Decimal	Hexadecimal	0 mA to 20 mA	
32767	7FFF	See note 1	Overflow
32512	7F00	See note 1	
32511	7EFF	23.52 mA	Overshoot range
27649	6C01		
27648	6C00	20 mA	Rated range
20736	5100	15 mA	
34	22	0.0247 mA	
0	0	0 mA	
Negative values		Negative values are not supported	

[1] In an overflow condition, analog outputs will behave according to the device configuration properties settings. In the "Reaction to CPU STOP" parameter, select either: "Use substitute value" or "Keep last value".

A.7.5 CPU 1215C wiring diagrams

Table A- 81 CPU 1215C AC/DC/Relay (6ES7215-1BG40-0XB0)



①	24 V DC Sensor Power Out For additional noise immunity, connect "M" to chassis ground even if not using sensor supply.
②	For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".
Note 1: X11 connectors must be gold. See Appendix C, Spare Parts for article number.	
Note 2: Either the L1 or N (L2) terminal can be connected to a voltage source up to 240 V AC. The N terminal can be considered L2 and is not required to be grounded. No polarization is required for L1 and N (L2) terminals.	
Note 3: See Device Configuration (Page 149) for information about the Ethernet port of the CPU.	

Table A- 82 Connector pin locations for CPU 1215C AC/DC/Relay (6ES7215-1BG40-0XB0)

Pin	X10	X11 (gold)	X12
1	L1 /120-240 V AC	2 M	1L

Note

Unused analog inputs should be shorted.

A.8 CPU 1217C

A.8.1 General specifications and features

Table A- 87 General

Technical data	CPU 1217C DC/DC/DC
Article number	6ES7217-1AG40-0XB0
Dimensions W x H x D (mm)	150 x 100 x 75
Shipping weight	530 grams
Power dissipation	12 W
Current available (SM and CM bus)	1600 mA max. (5 V DC)
Current available (24 V DC)	400 mA max. (sensor power)
Digital input current consumption (24 V DC)	4 mA/input used

Table A- 88 CPU features

Technical data		Description
User memory (Refer to "General technical specifications (Page 1343)", Internal CPU memory retention".)	Work	150 Kbytes
	Load	4 Mbytes, internal, expandable up to SD card size
	Retentive	10 Kbytes
Onboard digital I/O		14 inputs/ 10 outputs
Onboard analog I/O		2 inputs/ 2 outputs
Process image size		1024 bytes of inputs (I) / 1024 bytes of outputs (Q)
Bit memory (M)		8192 bytes
Temporary (local) memory		• 16 Kbytes for startup and program cycle (including associated FBs and FCs) • 6 Kbytes for each of the other interrupt priority levels (including FBs and FCs)
Signal modules expansion		8 SMs max.
SB, CB, BB expansion		1 max.
Communication module expansion		3 CMs max.
High-speed counters		Up to 6 configured to use any built-in or SB inputs (refer to CPU 1217C Digital input (DI) H/W configuration table) (Page 1417) • 1 MHz (Ib.2 to Ib.5) • 100/180 kHz (Ia.0 to Ia.5) • 30/120 kHz (Ia.6 to Ib.1)

Technical data	Description
Pulse outputs	Up to 4 configured to use any built-in or SB outputs (refer to CPU 1217C Digital output (DQ) H/W configuration table) (Page 1417) • 1 MHz (Qa.0 to Qa.3) • 100 kHz (Qa.4 to Qb.1)
Pulse catch inputs	14
Time delay interrupts	4 total with 1 ms resolution
Cyclic interrupts	4 total with 1 ms resolution
Edge interrupts	12 rising and 12 falling (16 and 16 with optional signal board)
Memory card	SIMATIC memory card (optional)
Real time clock accuracy	+/- 60 seconds/month
Real time clock retention time	20 days typ./12 days min. at 40 °C (maintenance-free Super Capacitor)

[1] The slower speed is applicable when the HSC is configured for quadrature mode of operation.

Table A- 89 Performance

Type of instruction		Execution speed	
		Direct addressing (I, Q and M)	DB accesses
Boolean		0.08 µs/instruction	
Move	Move_Bool	0.3 µs/instruction	1.17 µs/instruction
	Move_Word	0.137 µs/instruction	1.0 µs/instruction
	Move_Real	0.72 µs/instruction	1.0 µs/instruction
Real Math	Add Real	1.48 µs/instruction	1.78 µs/instruction

Note

Many variables affect measured times. The above performance times are for the fastest instructions in this category and error-free programs.

A.8.2 Timers, counters and code blocks supported by CPU 1217C

Table A- 90 Blocks, timers and counters supported by CPU 1217C

Element		Description
Blocks	Type	OB, FB, FC, DB
	Size	64 Kbytes
	Quantity	Up to 1024 blocks total (OBs + FBs + FCs + DBs)
	Address range for FBs, FCs, and DBs	FB and FC: 1 to 65535 (such as FB 1 to FB 65535) DB: 1 to 59999
	Nesting depth	16 from the program cycle or startup OB 6 from any interrupt event OB[1]
	Monitoring	Status of 2 code blocks can be monitored simultaneously
OBs	Program cycle	Multiple
	Startup	Multiple
	Time-delay interrupts	4 (1 per event)
	Cyclic interrupts	4 (1 per event)
	Hardware interrupts	50 (1 per event)
	Time error interrupts	1
	Diagnostic error interrupts	1
	Pull or plug of modules	1
	Rack or station failure	1
	Time of day	Multiple
	Status	1
	Update	1
	Profile	1
	MC-Interpolator	1
	MC-Servo	1
	MC-PreServo	1
	MC-PostServo	1
Timers	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, 16 bytes per timer
Counters	Type	IEC
	Quantity	Limited only by memory size
	Storage	Structure in DB, size dependent upon count type • SInt, USInt: 3 bytes • Int, UInt: 6 bytes • DInt, UDInt: 12 bytes

[1] Safety programs use two nesting levels. The user program therefore has a nesting depth of four in safety programs.

Table A- 91 Communication

Technical data	Description
Number of ports	2
Type	Ethernet
HMI device	4
Programming device (PG)	1
Connections	• 8 connections for Open User Communication (active or passive): TSEND_C, TRCV_C, TCON, TDISCON, TSEND, and TRC • 8 CPU-to-CPU connections (client or server) for GET/PUT data • 6 connections for dynamic allocation to either GET/PUT or Open User Communication
Data rates	10/100 Mb/s
Isolation (external signal logic)	Transformer isolated, 1500 V AC (type test)[1]
Cable type	CAT5e shielded
Interfaces	
Number of PROFINET interfaces	1
Number of interfaces PROFIBUS	0
Interface	
Interface hardware	
Number of ports	2
Integrated switch	Yes
RJ-45 (Ethernet)	Yes; X1
Protocols	
PROFINET IO controller	Yes
PROFINET IO device	Yes
SIMATIC communication	Yes
Open IE communication	Yes
Web server	Yes
Media redundancy	Yes
PROFINET IO controller	
Services	
PG/OP communication	Yes
S7 routing	Yes
Isochronous mode	No
Open IE communication	Yes
IRT	No
MRP	Yes as MRP client
PROFIenergy	Yes. The S7-1200 CPU only supports the PROFIenergy entity (with I-device functionality).
Prioritized startup	Yes (max. 16 PROFINET devices)
Number of connectable I/O devices max.	16
Number of IO devices that you can connect for RT, max.	16

Technical data		Description
Of which are in line, max.		16
Number of IO devices that can be activated/ deactivated simultaneously, max.		8
Update times		The minimum value of the update time also depends on the communication component set for PROFINET IO, on the number of IO devices, and the quantity of configured user data.
With RT		
Send clock of 1 ms		1 ms to 512 ms
PROFINET IO device		
Services		
PG/OP communication		Yes
S7 routing		Yes
Isochronous mode		No
Open IE communication		Yes
IRT, supported		No
MRP, supported		Yes
PROFIenergy		Yes
Shared device		Yes
Number of IO controllers with shared device, max.		2
SIMATIC communication		
S7 communication, as server		Yes
S7 communication, as client		Yes
User data per job, max.		See online help (S7 communication, user data size)
Open IE communication		
TCP/IP:		Yes
	Data length, max.	8 KB
	Several passive connections per port, supported	Yes
ISO-on-TCP (RFC1006):		Yes
	Data length, max.	8 KB
UDP:		Yes
	Data length, max.	1472 bytes
DHCP		No
SNMP		Yes
DCP		Yes
LLDP		Yes

[1] Ethernet port isolation is designed to limit hazard during short term network faults to hazardous voltages. It does not conform to safety requirements for routine AC line voltage isolation.

Table A- 92 Power supply

Technical data		**CPU 1217C DC/DC/DC**
Voltage range		20.4 V DC to 28.8 V DC
Line frequency		--
Input current (max. load)	CPU only	600 mA at 24 V DC
	CPU with all expansion accessories	1600 mA at 24 V DC
Inrush current (max.)		12 A at 28.8 V DC
I^2t		0.5 A^2s
Isolation (input power to logic)		Not isolated
Hold up time (from loss of power)		10 ms at 24 V DC
Internal fuse, not user replaceable		3 A, 250 V, slow blow

Table A- 93 Sensor power

Technical data	**CPU 1217C DC/DC/DC**
Voltage range	L+ minus 4 V DC min.
Output current rating (max.)	400 mA (short-circuit protected)
Maximum ripple noise (<10 MHz)	Same as input line
Isolation (CPU logic to sensor power)	Not isolated

A.8.3 Digital inputs and outputs

Table A- 94 Digital inputs

Technical data	**CPU 1217C DC/DC/DC**
Number of inputs	14: total: 10: Sink/source (IEC Type 1 sink) 4: Differential (RS422/RS485)
Type: Sink/source (IEC Type 1 sink)	Ia.0 to Ia.7, Ib.0 to Ib.1
Rated voltage	24 V DC at 4 mA, nominal
Continuous permissible voltage	30 V DC, max.
Surge voltage	35 V DC for 0.5 sec.
Logic 1 signal (min.)	15 V DC at 2.5 mA
Logic 0 signal (max.)	5 V DC at 1 mA
Isolation (field side to logic)	707 V DC (type test)
Isolation groups	1
Filter times	us settings: 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0 ms settings: 0.05, 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0

Technical data	**CPU 1217C DC/DC/DC**
HSC clock input rates (max.) (Logic 1 Level = 15 to 26 V DC)	100/80 kHz (Ia.0 to Ia.5) 30/20 kHz (Ia.6 to Ib.1)
Type: Differential input (RS422/RS485)	Ib.2 to Ib.5 (.2+ .2- to .5+ .5-)
Common mode voltage range	-7 V to +12 V, 1 second, 3 VRMS continuous (RS422/RS485 characteristics)
Built-in termination and bias	390 Ω to 2M on Ib'-', 390 Ω to +5 V on Ib'-', (biased OFF when T/B open-circuit) 220 Ω between Ib'+' and Ib'-'
Receiver input impedance	100 Ω including bias and termination
Differential receiver threshold/sensitivity	+/- 0.2 V min., 60 mV typical hysteresis (RS422/RS485 characteristics)
Isolation (field side to logic)	707 V DC (type test)
Isolation groups	1
Filter times	us settings: 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0 ms settings: 0.05, 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0
HSC clock input rates (max.)	Single phase: 1 MHz (Ib.2 to Ib.5) Quadrature phase: 1 MHz (Ib.2 to Ib.5)
Differential input channel-to-channel skew	40 ns max.
General specifications (all digital inputs)	
Number of inputs on simultaneously	5 Sink/source inputs (no adjacent points) and 4 differential inputs at 60 °C horizontal or 50 °C vertical 14 at 55 °C horizontal or 45 °C vertical
Cable length (meters)	500 m shielded, 300 m unshielded 50 m shielded for HSC inputs (sink/source) 50 m shielded, twisted pair for all differential inputs

Table A- 95 CPU 1217C Digital input (DI) H/W configuration table

Input	Type and rate
DIa.0	Type: 24 V, source-sink Type 1 input High-speed counter input rate: 100 kHz max.
DIa.1	Type: 24 V, source-sink Type 1 input High-speed counter input rate: 100 kHz max.
DIa.2	Type: 24 V, source-sink Type 1 input High-speed counter input rate: 100 kHz max.
DIa.3	Type: 24 V, source-sink Type 1 input High-speed counter input rate: 100 kHz max.
DIa.4	Type: 24 V, source-sink Type 1 input High-speed counter input rate: 100 kHz max.
DIa.5	Type: 24 V, source-sink Type 1 input High-speed counter input rate: 100 kHz max.
DIa.6	Type: 24 V, source-sink Type 1 input High-speed counter input rate: 30 kHz max.
DIa.7	Type: 24 V, source-sink Type 1 input High-speed counter input rate: 30 kHz max.
DIb.0	Type: 24 V, source-sink Type 1 input High-speed counter input rate: 30 kHz max.
DIb.1	Type: 24 V, source-sink Type 1 input High-speed counter input rate: 30 kHz max.
DIb.2+ .2-	Type: RS422/RS485 differential input High-speed counter input rate: 1 MHz max.
DIb.3+ .3-	Type: RS422/RS485 differential input High-speed counter input rate: 1 MHz max.
DIb.4+ .4-	Type: RS422/RS485 differential input High-speed counter input rate: 1 MHz max.
DIb.5+ .5-	Type: RS422/RS485 differential input High-speed counter input rate: 1 MHz max.

Table A- 96 Digital outputs

Technical data	**CPU 1217C DC/DC/DC**
Number of outputs	10 total 6: Solid state - MOSFET (sourcing) 4: Differential (RS422/RS485)
Type: Solid state - MOSFET (sourcing output)	Qa.4 to Qb.1
Voltage range	20.4 to 28.8 V DC
Logic 1 signal at max. current	20 V DC min.
Logic 0 signal with 10 KΩ load	0.1 V DC max.
Current (max.)	0.5 A
Lamp load	5 W
ON state resistance	0.6 Ω max.
Leakage current per point	10 µA max.
Surge current	8 A for 100 ms max.
Overload protection	No
Isolation (field side to logic)	707 V DC (type test)
Isolation groups	1
Inductive clamp voltage	L+ minus 48 V DC, 1 W dissipation
Switching delay (Qa.4 to Qb.1)	1.0 µs max., off to on 3.0 µs max., on to off
Maximum relay switching frequency	--
Pulse Train Output rate	100 kHz max. (Qa.4 to Qb.1)[1], 2 Hz min.
Type: Differential output (RS422/RS485)	Qa.0 to Qa.3 (.0+ 0- to .3+ .3-)
Common mode voltage range	-7 V to +12 V, 1 second, 3 VRMS continuous (RS422/RS485 characteristics)
Transmitter differential output voltage	2 V min. at RL = 100 Ω, 1.5 V min. at RL = 54 Ω (RS422/RS485 characteristics)
Built-in termination	100 Ω between Qa'+' and Qa'-'
Driver output impedance	100 Ω including termination
Isolation (field side to logic)	707 V DC (type test)
Isolation groups	1
Switching delay (DQa.0 to DQa.3)	100 ns max.
Differential output channel-to-channel skew	40 ns max.
Pulse train output rate	1 MHz (Qa.0 to Qa.3), 2 Hz min.
General specifications (all digital outputs)	
Behavior on RUN to STOP	Last value or substitute value (default value 0)

Technical data	CPU 1217C DC/DC/DC
Number of outputs on simultaneously	3 Solid state - MOSFET (sourcing) outputs (no adjacent points) and 4 differential outputs at 60 °C horizontal or 50 °C vertical 10 at 55 °C horizontal or 45 °C vertical
Cable length (meters)	500 m shielded, 150 m unshielded

[1] Depending on your pulse receiver and cable, an additional load resistor (at least 10% of rated current) may improve pulse signal quality and noise immunity.

Table A- 97 CPU 1217C Digital output (DQ) H/W configuration table

Output	Type and rate
DQa.0+ .0-	Type: RS422/RS485 differential output Pulse train output rate: 1 MHz max., 2 Hz min.
DQa.1+ .1-	Type: RS422/RS485 differential output Pulse train output rate: 1 MHz max., 2 Hz min.
DQa.2+ .2-	Type: RS422/RS485 differential output Pulse train output rate: 1 MHz max., 2 Hz min.
DQa.3+ .3-	Type: RS422/RS485 differential output Pulse train output rate: 1 MHz max., 2 Hz min.
DQa.4	Type: 24 V Sourcing output Pulse train output rate: 100 kHz max., 2 Hz min.
DQa.5	Type: 24 V Sourcing output Pulse train output rate: 100 kHz max., 2 Hz min.
DQa.6	Type: 24 V Sourcing output Pulse train output rate: 100 kHz max., 2 Hz min.
DQa.7	Type: 24 V Sourcing output Pulse train output rate: 100 kHz max., 2 Hz min.
DQb.0	Type: 24 V Sourcing output Pulse train output rate: 100 kHz max., 2 Hz min.
DQb.1	Type: 24 V Sourcing output Pulse train output rate: 100 kHz max., 2 Hz min.

A.8.4 Analog inputs and outputs

A.8.4.1 Analog input specifications

Table A- 98 Analog inputs

Technical data	Description
Number of inputs	2
Type	Voltage (single-ended)
Full-scale range	0 to 10 V
Full-scale range (data word)	0 to 27648
Overshoot range	10.001 to 11.759 V
Overshoot range (data word)	27649 to 32511
Overflow range	11.760 to 11.852 V
Overflow range (data word)	32512 to 32767
Resolution	10 bits
Maximum withstand voltage	35 V DC
Smoothing	None, Weak, Medium, or Strong See the table for Step response (ms) for the analog inputs of the CPU (Page 1422).
Noise rejection	10, 50, or 60 Hz
Impedance	≥100 KΩ
Isolation (field side to logic)	None
Accuracy (25 °C / -20 to 60 °C)	3.0% / 3.5% of full-scale
Cable length (meters)	100 m, shielded twisted pair

A.8.4.2 Step response of built-in analog inputs of the CPU

Table A- 99 Step Response (ms), 0 V to 10 V measured at 95%

Smoothing selection (sample averaging)	Rejection frequency (Integration time)		
	60 Hz	50 Hz	10 Hz
None (1 cycle): No averaging	50 ms	50 ms	100 ms
Weak (4 cycles): 4 samples	60ms	70 ms	200 ms
Medium (16 cycles): 16 samples	200 ms	240 ms	1150 ms
Strong (32 cycles): 32 samples	400 ms	480 ms	2300 ms
Sample time	**4.17 ms**	**5 ms**	**25 ms**

A.8.4.3 Sample time for the built-in analog ports of the CPU

Table A- 100 Sample time for built-in analog inputs of the CPU

Rejection frequency (Integration time selection)	Sample time
60 Hz (16.6 ms)	4.17 ms
50 Hz (20 ms)	5 ms
10 Hz (100 ms)	25 ms

A.8.4.4 Measurement ranges of the analog inputs for voltage (CPUs)

Table A- 101 Analog input representation for voltage (CPUs)

System		Voltage Measuring Range	
Decimal	Hexadecimal	0 to 10 V	
32767	7FFF	11.852 V	Overflow
32512	7F00		
32511	7EFF	11.759 V	Overshoot range
27649	6C01		
27648	6C00	10 V	Rated range
20736	5100	7.5 V	
34	22	12 mV	
0	0	0 V	
Negative values		Negative values are not supported	

A.8.4.5 Analog output specifications

Table A- 102 Analog outputs

Technical data	Description
Number of outputs	2
Type	Current
Full-scale range	0 to 20 mA
Full-scale range (data word)	0 to 27648
Overshoot range	20.01 to 23.52 mA
Overshoot range (data word)	27649 to 32511
Overflow range	see footnote [1]
Overflow range data word	32512 to 32767
Resolution	10 bits
Output drive impedance	≤500 Ω max.
Isolation (field side to logic)	None
Accuracy (25 °C / -20 to 60 °C)	3.0% / 3.5% of full-scale
Settling time	2 ms
Cable length (meters)	100 m, shielded twisted pair

[1] In an overflow condition, analog outputs will behave according to the device configuration properties settings. In the "Reaction to CPU STOP" parameter, select either: "Use substitute value" or "Keep last value".

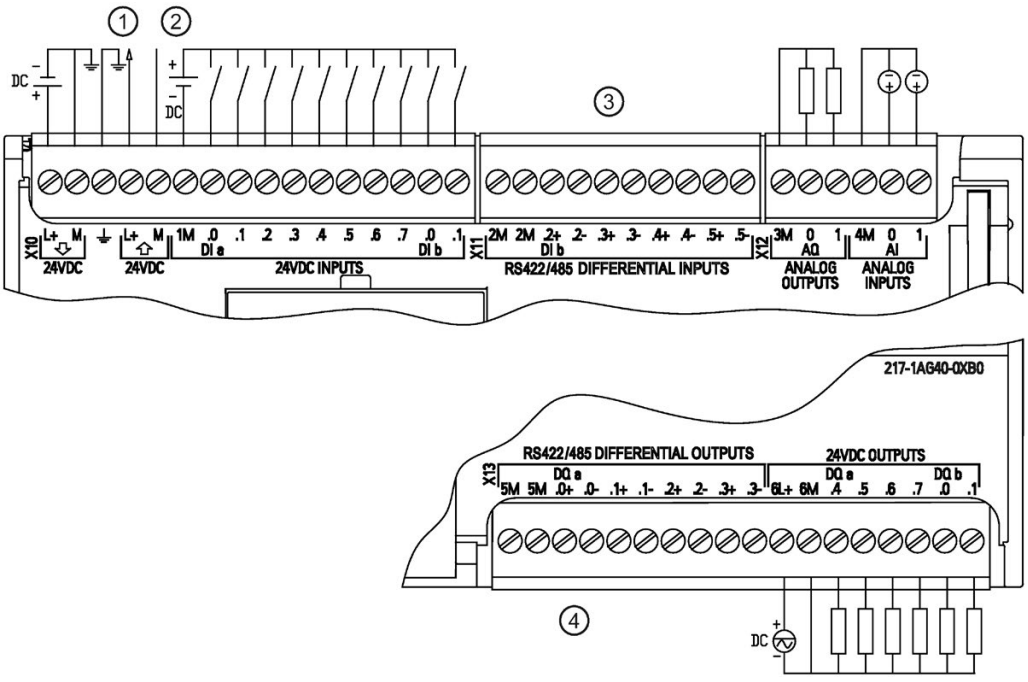

Table A- 103 Analog output representation for current (CPU 1215C and CPU 1217C)

System		Current output range	
Decimal	Hexadecimal	0 mA to 20 mA	
32767	7FFF	See note 1	Overflow
32512	7F00	See note 1	
32511	7EFF	23.52 mA	Overshoot range
27649	6C01		
27648	6C00	20 mA	Rated range
20736	5100	15 mA	
34	22	0.0247 mA	
0	0	0 mA	
Negative values		Negative values are not supported	

[1] In an overflow condition, analog outputs will behave according to the device configuration properties settings. In the "Reaction to CPU STOP" parameter, select either: "Use substitute value" or "Keep last value".

A.8.5 CPU 1217C wiring diagrams

Table A- 104 CPU 1217C DC/DC/DC (6ES7217-1AG40-0XB0)

①	24 V DC Sensor Power Out For additional noise immunity, connect "M" to chassis ground even if not using sensor supply.
②	For sinking inputs, connect "-" to "M" (shown). For sourcing inputs, connect "+" to "M".
③	See CPU 1217C Differential input (DI) detail and application example (Page 1427).
④	See CPU 1217C Differential output (DQ) detail and application example (Page 1428).
Note 1: X12 connectors must be gold. See Appendix C, Spare Parts (Page 1554) for article number.	
Note 2: See Device configuration (Page 149) for information about the Ethernet port of the CPU.

Table A- 118 Wiring diagram for the 8-point digital output relay changeover SM

SM 1222 DQ 8 x Relay Changeover (6ES7222-1XF32-0XB0)	
	

A changeover relay output controls two circuits using a common terminal: one normally closed contact, and one normally open contact. Using output "0" as an example, when the output point is OFF, the common (0L) is connected to the normally closed contact (.0X) and disconnected from the normally open contact (.0). When the output point is ON, the common (0L) is disconnected from the normally closed contact (.0X) and connected to the normally open contact (.0).

A.9.5 SM 1223 digital input/output V AC specifications

Table A- 132 General specifications

Model	SM 1223 DI 8 x120/230 V AC / DQ 8 x Relay
Article number	6ES7223-1QH32-0XB0
Dimensions W x H x D (mm)	45 x 100 x 75 mm
Weight	190 grams
Power dissipation	7.5 W
Current consumption (SM Bus)	120 mA
Current consumption (24 V DC)	11 mA per output when on

Table A- 133 Digital inputs

Model	SM 1223 DI 8 x 120/230 V AC / DQ 8 x Relay
Number of inputs	8
Type	IEC Type 1
Rated voltage	120 V AC at 6 mA, 230 V AC at 9 mA
Continuous permissible voltage	264 V AC
Surge voltage	--
Logic 1 signal (min.)	79 V AC at 2.5 mA
Logic 0 signal (max.)	20 V AC at 1 mA
Leakage current (max.)	1 mA
Isolation (field side to logic)	1500 V AC
Isolation groups[1]	4
Input delay times	Typical: 0.2 to 12.8 ms, user selectable Maximum: -
Connection of 2 wire proximity sensor (Bero) (max.)	1 mA
Cable length	Unshielded: 300 meters Shielded: 500 meters
Number of inputs on simultaneously	8

[1] Channels within a group must be of the same phase.

Table A- 134 Digital outputs

Model	**SM 1223 DI 8 x 120/230 V AC / DQ 8 x Relay**
Number of outputs	8
Type	Relay, mechanical
Voltage range	5 to 30 V DC or 5 to 250 V AC
Logic 1 signal at max. current	--
Logic 0 signal with 10K Ω load	--
Current (max.)	2.0 A
Lamp load	30 W DC / 200 W AC
ON state contact resistance	0.2 Ω max. when new
Leakage current per point	--
Surge current	7 A with contacts closed
Overload protection	No
Isolation (field side to logic)	1500 V AC (coil to contact) None (coil to logic)
Isolation groups	2
Current per common (max.)	10 A
Inductive clamp voltage	--
Switching delay (max.)	10 ms
Maximum relay switching frequency	1 Hz
Lifetime mechanical (no load)	10,000,000 open/close cycles
Lifetime contacts at rated load	100,000 open/close cycles
Behavior on RUN to STOP	Last value or substitute value (default value 0)
Number of outputs on simultaneously	• 4 (no adjacent points) at 60 °C horizontal or 50 °C vertical • 8 at 55 °C horizontal or 45 °C vertical
Cable length (meters)	500 m shielded, 150 m unshielded

Table A- 135 SM 1223 DI 8 x 120/230 V AC, DQ 8 x Relay (6ES7223-1QH32-0XB0)

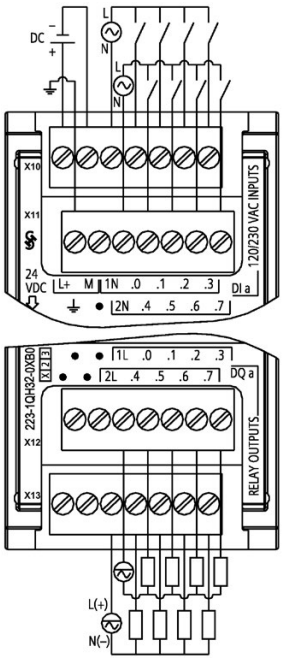

Table A- 136 Connector Pin Locations for SM 1223 DI 8 x 120/240 V AC, DQ 8 x Relay (6ES7223-1QH32-0XB0)

Pin	X10	X11	X12	X13
1	L+ / 24 V DC	Functional Earth	No connection	No connection
2	M / 24 V DC	No connection	No connection	No connection
3	1N	2N	1L	2L
4	DI a.0	DI a.4	DQ a.0	DQ a.4
5	DI a.1	DI a.5	DQ a.1	DQ a.5
6	DI a.2	DI a.6	DQ a.2	DQ a.6
7	DI a.3	DI a.7	DQ a.3	DQ a.7

A.10 Analog signal modules (SMs)

A.10.1 SM 1231 analog input module specifications

Table A- 137 General specifications

Model	SM 1231 AI 4 x 13 bit	SM 1231 AI 8 x 13 bit	SM 1231 AI 4 x 16 bit
Article number	6ES7231-4HD32-0XB0	6ES7231-4HF32-0XB0	6ES7231-5ND32-0XB0
Dimensions W x H x D (mm)	45 x 100 x 75		
Weight	180 grams		
Power dissipation	2.2 W	2.3 W	2.0 W
Current consumption (SM Bus)	80 mA	90 mA	80 mA
Current consumption (24 V DC)	45 mA		65 mA

Table A- 138 Analog inputs

Model	SM 1231 AI 4 x 13 bit	SM 1231 AI 8 x 13 bit	SM 1231 AI 4 x 16 bit
Number of inputs	4	8	4
Type	Voltage or current (differential): Selectable in groups of 2		Voltage or current (differential)
Range	±10 V, ±5 V, ±2.5 V, 0 to 20 mA, or 4 mA to 20 mA		±10 V, ±5 V, ±2.5 V, ±1.25 V, 0 to 20 mA or 4 mA to 20 mA
Full scale range (data word)	-27648 to 27648 voltage / 0 to 27648 current		
Overshoot/undershoot range (data word) Refer to the section on analog input ranges for voltage and current (Page 1458).	Voltage: 32511 to 27649 / -27649 to -32,512 Current: 32511 to 27649 / 0 to -4864		
Overflow/underflow (data word) Refer to the section on input ranges for voltage and current (Page 1458).	Voltage: 32767 to 32512 / -32513 to -32768 Current 0 to 20 mA: 32767 to 32512 / -4865 to -32768 Current 4 to 20 mA: 32767 to 32512 (values below -4864 indicate open wire)		
Resolution1	12 bits + sign bit		15 bits + sign bit
Maximum withstand voltage/current	±35 V / ±40 mA		
Smoothing	None, weak, medium, or strong Refer to the section on step response times (Page 1457).		
Noise rejection	400, 60, 50, or 10 Hz Refer to the section on sample rates (Page 1457).		
Input impedance	≥ 9 MΩ (voltage) / ≥ 270 Ω, < 290 Ω (current)		≥ 1 MΩ (voltage) / < 315 Ω, > 280 Ω (current)

Model	SM 1231 AI 4 x 13 bit	SM 1231 AI 8 x 13 bit	SM 1231 AI 4 x 16 bit
Isolation Field side to logic Logic to 24 V DC Field side to 24 V DC Channel to channel	None		 707 V DC (type test) 707 V DC (type test) 500 V DC (type test) None
Accuracy (25 °C / -20 to 60 °C)	±0.1% / ±0.2% of full scale		±0.1% / ±0.3% of full scale
Measuring principle	Actual value conversion		
Common mode rejection	40 dB, DC to 60 Hz		
Operational signal range[1]	Signal plus common mode voltage must be less than +12 V and greater than -12 V		
Cable length (meters)	100 m, twisted and shielded		

[1] Voltages outside the operational range applied to one channel may cause interference on other channels.

Table A- 139 Diagnostics

Model	SM 1231 AI 4 x 13 bit	SM 1231 AI 8 x 13 bit	SM 1231 AI 4 x 16 bit
Overflow/underflow	Yes		
24 V DC low voltage	Yes		
Open wire	4 to 20 mA range only (if input is below -4864; 1.185 mA)		

SM 1231 current measurment

You can implement current measurement with either a 2-wire transducer or 4-wire transducer as shown in the following figure:

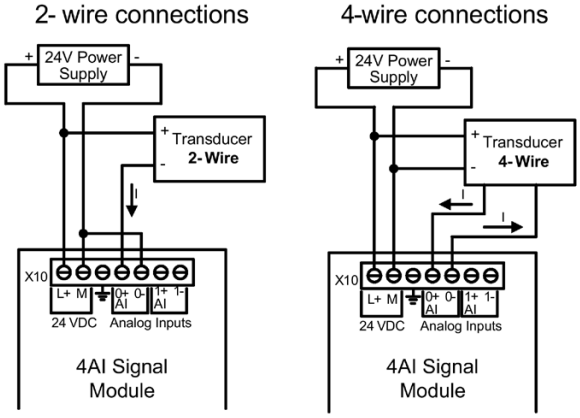

Table A- 140 Wiring diagrams for the analog input SMs

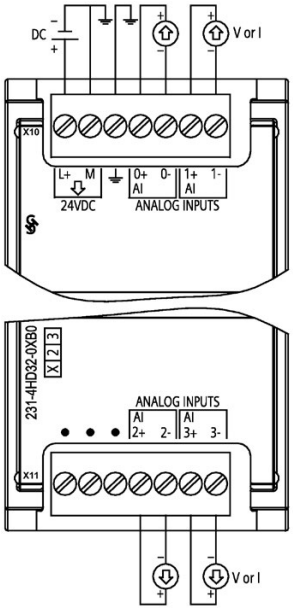

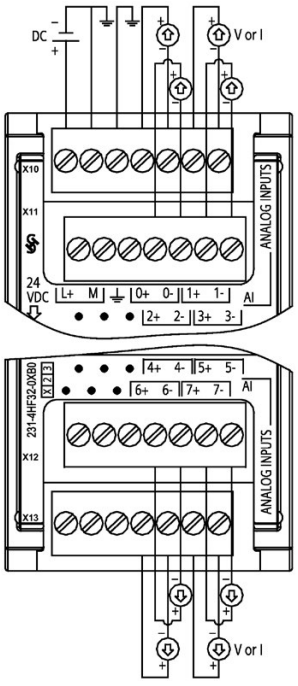

SM 1231 AI 4 x 13 bit (6ES7231-4HD32-0XB0)	SM 1231 AI 8 x 13 bit (6ES7231-4HF32-0XB0)
	
Note: Connectors must be gold. See Appendix C, Spare Parts for article number.	

Table A- 141 Connector pin locations for SM 1231 AI 4 x 13 bit (6ES7231-4HD32-0XB0)

Pin	X10 (gold)	X11 (gold)
1	L+ / 24 V DC	No connection
2	M / 24 V DC	No connection
3	Functional Earth	No connection
4	AI 0+	AI 2+
5	AI 0-	AI 2-
6	AI 1+	AI 3+
7	AI 1-	AI 3-

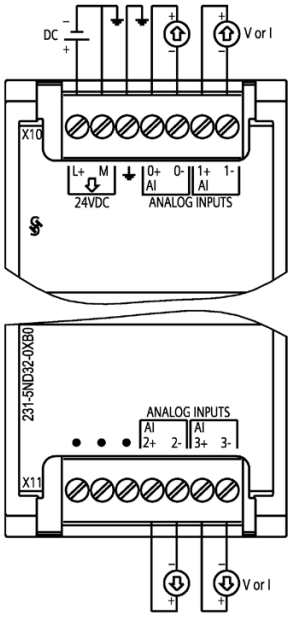
Table A- 143 Wiring diagram for the analog input SM



SM 1231 AI 4 x 16 bit (6ES7231-5ND32-0XB0)	
	
Note: Connectors must be gold. See Appendix C, Spare Parts for article number.	

Table A- 144 Connector pin locations for SM 1231 AI 4 x 16 bit (6ES7231-5ND32-0XB0)

Pin	X10 (gold)	X11 (gold)
1	L+ / 24 V DC	No connection
2	M / 24 V DC	No connection
3	Functional Earth	No connection
4	AI 0+	AI 2+
5	AI 0-	AI 2-
6	AI 1+	AI 3+
7	AI 1-	AI 3-

Note

Unused voltage input channels should be shorted.

Unused current input channels should be set to the 0 to 20 mA range and/or disable broken wire error reporting.

Inputs configured for current mode will not conduct loop current unless the module is powered and configured.

Current input channels will not operate unless external power is supplied to the transmitter.

A.10.2 SM 1232 analog output module specifications

Table A- 145 General specifications

Technical data	SM 1232 AQ 2 x 14 bit	SM 1232 AQ 4 x 14 bit
Article number	6ES7232-4HB32-0XB0	6ES7232-4HD32-0XB0
Dimensions W x H x D (mm)	45 x 100 x 75	
Weight	180 grams	
Power dissipation	1.8 W	2.0 W
Current consumption (SM Bus)	80 mA	
Current consumption (24 V DC)	45 mA (no load)	

Table A- 146 Analog outputs

Technical data	SM 1232 AQ 2 x 14 bit	SM 1232 AQ 4 x 14 bit
Number of outputs	2	4
Type	Voltage or current	
Range	±10 V, 0 to 20 mA, or 4 mA to 20 mA	
Resolution	Voltage: 14 bits Current: 13 bits	
Full scale range (data word)	Voltage: -27,648 to 27,648 ; Current: 0 to 27,648 Refer to the output ranges for voltage and current (Page 1460).	
Accuracy (25 °C / -20 to 60 °C)	±0.3% / ±0.6% of full scale	
Settling time (95% of new value)	Voltage: 300 µs (R), 750 µs (1 uF) Current: 600 µs (1 mH), 2 ms (10 mH)	
Load impedance	Voltage: ≥ 1000 Ω Current: ≤ 600 Ω	
Maximum output short circuit current	Voltage mode: ≤ 24 mA Current mode: ≥ 38.5 mA	
Behavior on RUN to STOP	Last value or substitute value (default value 0)	
Isolation (field side to logic)	none	

Technical data	SM 1232 AQ 2 x 14 bit	SM 1232 AQ 4 x 14 bit
Isolation (24 V to output)	none	
Cable length (meters)	100 m twisted and shielded	

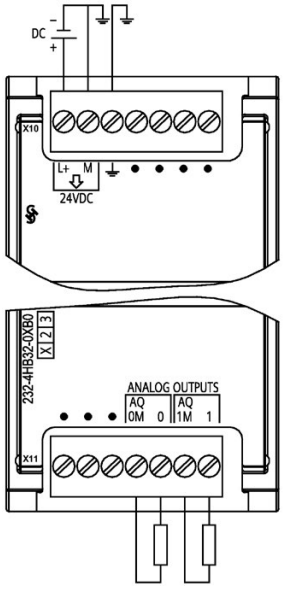
Table A- 147 Diagnostics

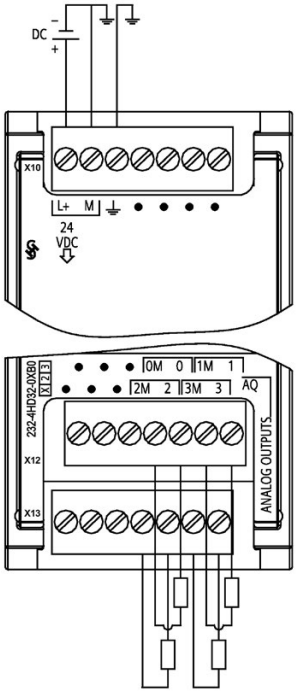
Technical data	SM 1232 AQ 2 x 14 bit	SM 1232 AQ 4 x 14 bit
Overflow/underflow	Yes	
Short to ground (voltage mode only)	Yes	
Wire break (current mode only)[1]	Yes	
24 V DC low voltage[2]	Yes	

1 Short circuit detection is only possible when the output voltage is less than -0.5 V or greater than +0.5 V.

2 Wire break detection is only possible when the output current is greater than 1 mA.

Table A- 148 Wiring diagrams for the analog output SMs





SM 1232 AQ 2 x 14 bit (6ES7232-4HB32-0XB0)	SM 1232 AQ 4 x 14 bit (6ES7232-4HD32-0XB0)
	
Note: Connectors must be gold. See Appendix C, Spare Parts for article number.	

Table A- 149 Connector pin locations for SM 1232 AQ 2 x 14 bit (6ES7232-4HB32-0XB0)

Pin	X10 (gold)	X11 (gold)
1	L+ / 24 V DC	No connection
2	M / 24 V DC	No connection
3	Functional Earth	No connection
4	No connection	AQ 0M
5	No connection	AQ 0
6	No connection	AQ 1M
7	No connection	AQ 1

Table A- 150 Connector pin locations for SM 1232 AQ 4 x 14 bit (6ES7232-4HD32-0XB0)

Pin	X10 (gold)	X12 (gold)	X13 (gold)
1	L+ / 24 V DC	No connection	No connection

3	Functional Earth	No connection	No connection
4	No connection	AQ 0M	AQ 2M
5	No connection	AQ 0	AQ 2
6	No connection	AQ 1M	AQ 3M
7	No connection	AQ 1	AIQ 3

A.10.3 SM 1234 analog input/output module specifications

Table A- 151 General specifications

Technical data	SM 1234 AI 4 x 13 bit / AQ 2 x 14 bit
Article number	6ES7234-4HE32-0XB0
Dimensions W x H x D (mm)	45 x 100 x 75
Weight	220 grams
Power dissipation	2.4 W
Current consumption (SM Bus)	80 mA
Current consumption (24 V DC)	60 mA (no load)

Table A- 152 Analog inputs

Model	SM 1234 AI 4 x 13 bit / AQ 2 x 14 bit
Number of inputs	4
Type	Voltage or Current (differential): Selectable in groups of 2
Range	±10 V, ±5 V, ±2.5 V, 0 to 20 mA, or 4 mA to 20 mA
Full scale range (data word)	-27648 to 27648
Overshoot/undershoot range (data word)	Voltage: 32511 to 27649 / -27649 to -32512 Current: 32511 to 27649 / 0 to -4864 Refer to the section on input ranges for voltage and current (Page 1458).
Overflow/underflow (data word)	Voltage: 32767 to 32512 / -32513 to -32768 Current: 32767 to 32512 / -4865 to -32768 Refer to the section on input ranges for voltage and current (Page 1458).
Resolution	12 bits + sign bit
Maximum withstand voltage/current	±35 V / ±40 mA
Smoothing	None, weak, medium, or strong Refer to the section on step response times (Page 1457).
Noise rejection	400, 60, 50, or 10 Hz Refer to the section on sample rates (Page 1457).
Input impedance	≥ 9 MΩ (voltage) / ≥ 270 Ω, < 290 Ω (current)
Isolation (field side to logic)	None
Accuracy (25 °C / -20 to 60 °C)	±0.1% / ±0.2% of full scale
Analog to digital conversion time	625 µs (400 Hz rejection)
Common mode rejection	40 dB, DC to 60 Hz
Operational signal range[1]	Signal plus common mode voltage must be less than +12 V and greater than -12 V
Cable length (meters)	100 m, twisted and shielded

[1] Voltages outside the operational range applied to one channel may cause interference on other channels.

Table A- 153 Analog outputs

Technical data	SM 1234 AI 4 x 13 bit / AQ 2 x 14 bit
Number of outputs	2
Type	Voltage or current
Range	±10 V or 0 to 20 mA or 4 mA to 20 mA
Resolution	Voltage: 14 bits ; Current: 13 bits
Full scale range (data word)	Voltage: -27648 to 27648; Current: 0 to 27648 Refer to the section on output ranges for voltage and current (Page 1460).
Accuracy (25 °C / -20 to 60 °C)	±0.3% / ±0.6% of full scale
Settling time (95% of new value)	Voltage: 300 µs (R), 750 µs (1 uF) Current: 600 µs (1 mH), 2 ms (10 mH)
Load impedance	Voltage: ≥ 1000 Ω Current: ≤ 600 Ω
Maximum output short circuit current	Voltage mode: ≤ 24 mA Current mode: ≥ 38.5 mA
Behavior on RUN to STOP	Last value or substitute value (default value 0)
Isolation (field side to logic)	none
Isolation (24 V to output)	none
Cable length (meters)	100 m twisted and shielded

Table A- 154 Diagnostics

Model	SM 1234 AI 4 x 13 bit / AQ 2 x 14 bit
Overflow/underflow	Yes
Short to ground (voltage mode only)[1]	Yes on outputs
Wire break (current mode only)[2]	Yes on outputs
24 V DC low voltage	Yes

1 Short circuit detection is only possible when the output voltage is less than -0.5 V or greater than +0.5 V.

2 Wire break detection is only possible when the output current is greater than 1 mA.

SM 1234 current measurement

You can implement current measurement with either a 2-wire transducer or 4-wire transducer as shown in the following figure:

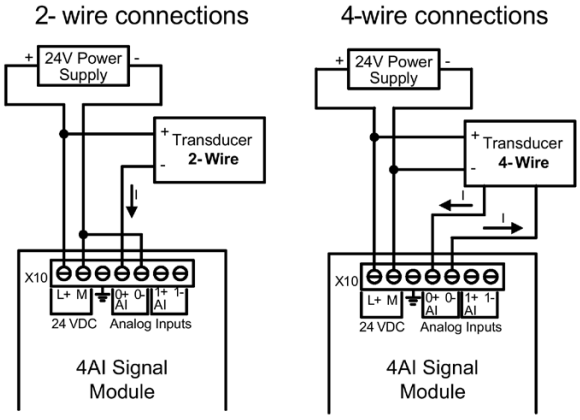

Table A- 155 Wiring diagrams for the analog input/output SM

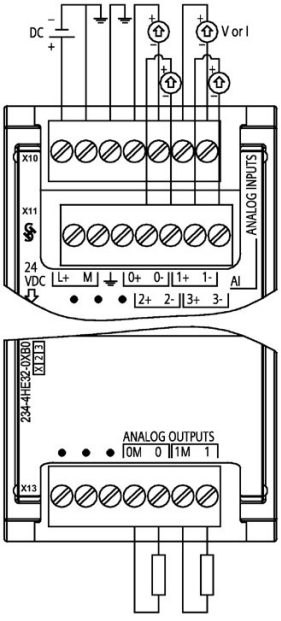

SM 1234 AI 4 x 13 Bit / AQ 2 x 14 bit (6ES7234-4HE32-0XB0)	
	
Note: Connectors must be gold. See Appendix C, Spare Parts for article number.	

Table A- 156 Connector pin locations for SM 1234 AI 4 x 13 Bit / AQ 2 x 14 bit (6ES7234-4HE32-0XB0)

Pin	X10 (gold)	X11 (gold)	X13 (gold)
1	L+ / 24 V DC	No connection	No connection
2	M / 24 V DC	No connection	No connection
3	Functional Earth	No connection	No connection
4	AI 0+	AI 2+	AQ 0M
5	AI 0-	AI 2-	AQ 0
6	AI 1+	AI 3+	AQ 1M
7	AI 1-	AI 3-	AQ 1

Note

Unused voltage input channels should be shorted.

Unused current input channels should be set to the 0 to 20 mA range and/or disable broken wire error reporting.

Inputs configured for current mode will not conduct loop current unless the module is powered and configured.

Current input channels will not operate unless external power is supplied to the transmitter.

A.10.4 Step response of the analog inputs

Table A- 157 Step response (ms), 0 to full-scale measured at 95%

Smoothing selection (sample averaging)	Noise reduction/rejection frequency (Integration time selection)			
	400 Hz (2.5 ms)	60 Hz (16.6 ms)	50 Hz (20 ms)	10 Hz (100 ms)
None (1 cycle): No averaging	4 ms	18 ms	22 ms	100 ms
Weak (4 cycles): 4 samples	9 ms	52 ms	63 ms	320 ms
Medium (16 cycles): 16 samples	32 ms	203 ms	241 ms	1200 ms
Strong (32 cycles): 32 samples	61 ms	400 ms	483 ms	2410 ms

A.10.5 Sample time and update times for the analog inputs

Table A- 158 Sample and module update times for all channels

Rejection frequency (Integration time)	Sample and module update times for all channels			
	400 Hz (2.5 ms)	60 Hz (16.6 ms)	50 Hz (20 ms)	10 Hz (100 ms)
4-channel x 13 bit SM	0.625 ms	4.17 ms	5 ms	25 ms
8-channel x 13 bit SM	1.25 ms	4.17 ms	5 ms	25 ms
4-channel x 16 bit SM	0.417 ms	0.397 ms	0.400 ms	0.400 ms

A.10.6 Measurement ranges of the analog inputs for voltage and current (SB and SM)

Table A- 159 Analog input representation for voltage (SB and SM)

System		Voltage Measuring Range				
Decimal	Hexadecimal	±10 V	±5 V	±2.5 V	±1.25 V	
32767	7FFF[1]	11.851 V	5.926 V	2.963 V	1.481 V	Overflow
32512	7F00					
32511	7EFF	11.759 V	5.879 V	2.940 V	1.470 V	Overshoot range
27649	6C01					
27648	6C00	10 V	5 V	2.5 V	1.250 V	Rated range
20736	5100	7.5 V	3.75 V	1.875 V	0.938 V	
1	1	361.7 µV	180.8 µV	90.4 µV	45.2 µV	
0	0	0 V	0 V	0 V	0 V	
-1	FFFF					
-20736	AF00	-7.5 V	-3.75 V	-1.875 V	-0.938 V	
-27648	9400	-10 V	-5 V	-2.5 V	-1.250 V	
-27649	93FF					Undershoot range
-32512	8100	-11.759 V	-5.879 V	-2.940 V	-1.470 V	
-32513	80FF					Underflow
-32768	8000	-11.851 V	-5.926 V	-2.963 V	-1.481 V	

[1] 7FFF can be returned for one of the following reasons: overflow (as noted in this table), before valid values are available (for example immediately upon a power up), or if a wire break is detected.

Table A- 160 Analog input representation for current (SB and SM)

System		Current measuring range		
Decimal	**Hexadecimal**	**0 mA to 20 mA**	**4 mA to 20 mA**	
32767	7FFF	> 23.52 mA	> 22.81 mA	Overflow
32511	7EFF	23.52 mA	22.81 mA	Overshoot range
27649	6C01			
27648	6C00	20 mA	20 mA	Nominal range
20736	5100	15 mA	16 mA	
1	1	723.4 nA	4 mA + 578.7 nA	
0	0	0 mA	4 mA	
-1	FFFF			Undershoot range
-4864	ED00	-3.52 mA	1.185 mA	
32767[1]	7FFF		< 1.185 mA	Wire break (4 to 20 mA)
-32768	8000	< -3.52 mA		Underflow (0 to 20 mA)

[1] The wire break value of 32767 (16#7FFF) is always returned regardless of the state of the wire break alarm.

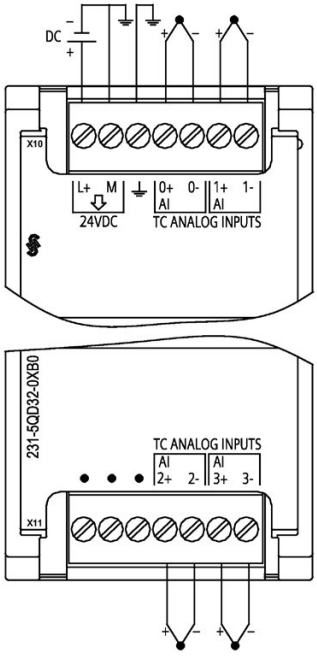
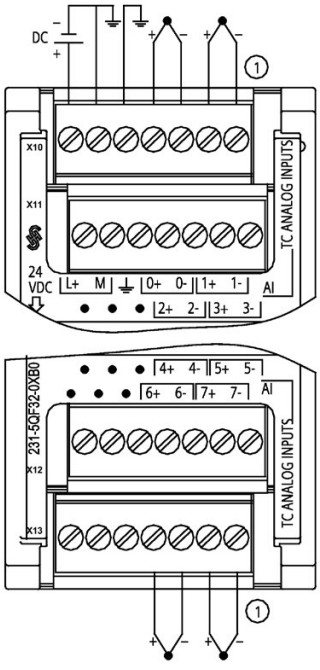
Table A- 165 Diagnostics

Model	SM 1231 AI 4 x 16 bit TC	SM 1231 AI 8 x 16 bit TC
Overflow/underflow [1]	Yes	
Wire break [2, 3]	Yes	
24 V DC low voltage [1]	Yes	

1 The overflow, underflow and low voltage diagnostic alarm information will be reported in the analog data values even if the alarms are disabled in the module configuration.





2 When wire break alarm is disabled and an open wire condition exists in the sensor wiring, the module may report random values.

3 The module performs wire break testing every 6 seconds, which extends the update time by 9 ms for each enable channel once every 6 seconds.

The SM 1231 Thermocouple (TC) analog signal module measures the value of voltage connected to the module inputs. The temperature measurement type can be either "Thermocouple" or "Voltage".

- "Thermocouple": The value will be reported in degrees multiplied by ten (for example, 25.3 degrees will be reported as decimal 253).
- "Voltage": The nominal range full scale value will be decimal 27648.

7	AI 1- /TC	AI 3- /TC	AI 5- /TC	AI 7- /TC

Note

Unused analog inputs should be shorted.

The thermocouple unused channels can be deactivated. No error will occur if an unused channel is deactivated.

A.11.1.1 Basic operation for a thermocouple

Thermocouples are formed whenever two dissimilar metals are electrically bonded to each other. A voltage is generated that is proportional to the junction temperature. This voltage is small; one microvolt could represent many degrees. Measuring the voltage from a thermocouple, compensating for extra junctions, and then linearizing the result forms the basis of temperature measurement using thermocouples.

When you connect a thermocouple to the SM 1231 Thermocouple module, the two dissimilar metal wires are attached to the module at the module signal connector. The place where the two dissimilar wires are attached to each other forms the sensor thermocouple.

Two more thermocouples are formed where the two dissimilar wires are attached to the signal connector. The connector temperature causes a voltage that adds to the voltage from the sensor thermocouple. If this voltage is not corrected, then the temperature reported will deviate from the sensor temperature.

Cold junction compensation is used to compensate for the connector thermocouple. Thermocouple tables are based on a reference junction temperature, usually zero degrees Celsius. The cold junction compensation compensates the connector to zero degrees Celsius. The cold junction compensation restores the voltage added by the connector thermocouples. The temperature of the module is measured internally, and then converted to a value to be added to the sensor conversion. The corrected sensor conversion is then linearized using the thermocouple tables.

For optimum operation of the cold junction compensation, the thermocouple module must be located in a thermally stable environment. Slow variation (less than 0.1 °C/minute) in ambient module temperature is correctly compensated within the module specifications. Air movement across the module will also cause cold junction compensation errors.

If better cold junction error compensation is needed, an external iso-thermal terminal block may be used. The thermocouple module provides for use of a 0 °C referenced or 50 °C referenced terminal block.

A.11.1.2 Selection tables for the SM 1231 thermocouple

The ranges and accuracy for the different thermocouple types supported by the SM 1231 Thermocouple signal module are shown in the table below.

Table A- 169 Thermocouple selection table

Type	Under-range minimum[1]	Nominal range low limit	Nominal range high limit	Over-range maximum[2]	Normal range [3, 4] accuracy @ 25 °C	Normal range [1, 2] accuracy -20 °C to 60 °C
J	-210.0 °C	-150.0 °C	1200.0 °C	1450.0 °C	±0.3 °C	±0.6 °C
	-346.0 °F	-238.0 °F	2192.0 °F	2642.0 °F	±0.5 °F	±1.1 °F
K	-270.0 °C	-200.0 °C	1372.0 °C	1622.0 °C	±0.4 °C	±1.0 °C
	-454.0 °F	-328.0 °F	2501.6 °F	2951.6 °F	±0.7 °F	±1.8 °F
T	-270.0 °C	-200.0 °C	400.0 °C	540.0 °C	±0.5 °C	±1.0 °C
	-454.0 °F	-328.0 °F	752.0 °F	1004.0 °F	±0.9 °F	±1.8 °F
E	-270.0 °C	-200.0 °C	1000.0 °C	1200.0 °C	±0.3 °C	±0.6 °C
	-454.0 °F	-328.0 °F	1832.0 °F	2192.0 °F	±0.5 °F	±1.1 °F
R & S	-50.0 °C	100.0 °C	1768.0 °C	2019.0 °C	±1.0 °C	±2.5 °C
	-58.0 °C	212.0 °F	3214.4 °F	3276.6 °F [5]	±1.8 °F	±4.5 °F
B	0.0 °C	200.0 °C	800.0 °C	--	±2.0 °C	±2.5 °C
	32.0 °F	392.0 °F	1472.0 °F	--	±3.6 °F	±4.5 °F
	--	800.0 °C	1820.0 °C	1820.0 °C	±1.0 °C	±2.3 °C
	--	1472.0 °F	3276.6 °F [5]	3276.6 °F [5]	±1.8 °F	±4.1 °F
N	-270.0 °C	-200.0 °C	1300.0 °C	1550.0 °C	±1.0 °C	±1.6 °C
	-454.0 °F	-328.0 °F	2372.0 °F	2822.0 °F	±1.8 °F	±2.9 °F
C	0.0 °C	100.0 °C	2315.0 °C	2500.0 °C	±0.7 °C	±2.7 °C
	32.0 °F	212.0 °F	3276.6 °F [5]	3276.6 °F [5]	±1.3 °F	±4.9 °F
TXK/XK(L)	-200.0 °C	-150.0 °C	800.0 °C	1050.0 °C	±0.6 °C	±1.2 °C
	-328.0 °F	302.0 °F	1472.0 °F	1922.0 °F	±1.1 °F	±2.2 °F
Voltage	-32512	-27648 -80mV	27648 80mV	32511	±0.05%	±0.1%

1 Thermocouple values below the under-range minimum value are reported as -32768.

2 Thermocouple values above the over-range maximum value are reported as 32767.

3 Internal cold junction error is ±1.5 °C for all ranges. This adds to the error in this table. The module requires at least 30 minutes of warm-up time to meet this specification.

4 In the presence of radiated radio frequency of 970 MHz to 990 MHz, the accuracy of the SM 1231 AI 4 x 16 bit TC may be degraded.

5 Lower limit of 3276.6 with °F reporting

Note

Thermocouple channel

Each channel on the Thermocouple signal module can be configured with a different thermocouple type (selectable in the software during configuration of the module).

Table A- 170 Noise reduction and update times for the SM 1231 Thermocouple

Rejection frequency selection	Integration time	4 Channel module update time (seconds)	8 Channel module update time (seconds)
400 Hz (2.5 ms)	10 ms [1]	0.143	0.285
60 Hz (16.6 ms)	16.67 ms	0.223	0.445
50 Hz (20 ms)	20 ms	0.263	0.525
10 Hz (100 ms)	100 ms	1.225	2.450

[1] To maintain module resolution and accuracy when 400 Hz rejection is selected, the integration time is 10 ms. This selection also rejects 100 Hz and 200 Hz noise.

It is recommended for measuring thermocouples that a 100 ms integration time be used. The use of smaller integration times will increase the repeatability error of the temperature readings.

Note

After power is applied, the module performs internal calibration for the analog-to-digital converter. During this time the module reports a value of 32767 on each channel until valid data is available on that channel. Your user program may need to allow for this initialization time. Because the configuration of the module can vary the length of the initialization time, you should verify the behavior of the module in your configuration. If required, you can include logic in your user program to accommodate the initialization time of the module.

Representation of analog values for Thermocouple Type J

A representation of the analog values of thermocouples type J is shown in the table below.

Table A- 171 Representation of analog values of thermocouples type J

Type J in °C	Units		Type J in °F	Units		Range
	Decimal	Hexadecimal		Decimal	Hexadecimal	
> 1450.0	32767	7FFF	> 2642.0	32767	7FFF	Overflow
1450.0 : 1200.1	14500 : 12001	38A4 : 2EE1	2642.0 : 2192.2	26420 : 21922	6734 : 55A2	Overrange
1200.0 : -150.0	12000 : -1500	2EE0 : FA24	2192.0 : -238.0	21920 : -2380	55A0 : F6B4	Rated range
< -150.0	-32768	8000	< -238.0	-32768	8000	Underflow[1]

[1] Faulty wiring (for example, polarity reversal, or open inputs) or sensor error in the negative range (for example, wrong type of thermocouple) may cause the thermocouple module to signal underflow.

A.11.2 SM 1231 RTD

SM 1231 RTD specifications

Table A- 172 General specifications

Technical data	SM 1231 AI 4 x RTD x 16 bit	SM 1231 AI 8 x RTD x 16 bit
Article number	6ES7231-5PD32-0XB0	6ES7231-5PF32-0XB0
Dimensions W x H x D (mm)	45 x 100 x 75	70 x 100 x 75
Weight	220 grams	270 grams
Power dissipation	1.5 W	
Current consumption (SM Bus)	80 mA	90 mA
Current consumption (24 V DC) [1]	40 mA	

[1] 20.4 to 28.8 V DC (Class 2, Limited Power, or sensor power from CPU)

Table A- 173 Analog inputs

Technical data		SM 1231 AI 4 x RTD x 16 bit	SM 1231 AI 8 x RTD x16 bit
Number of inputs		4	8

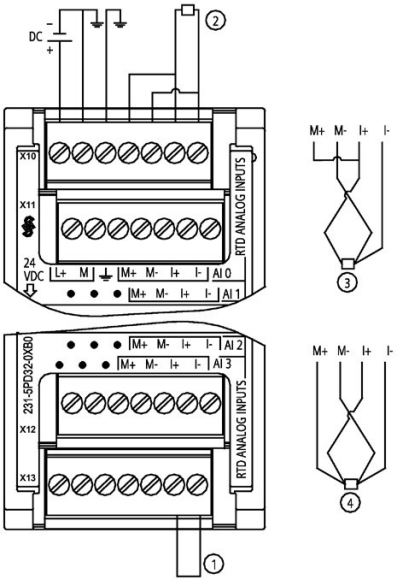
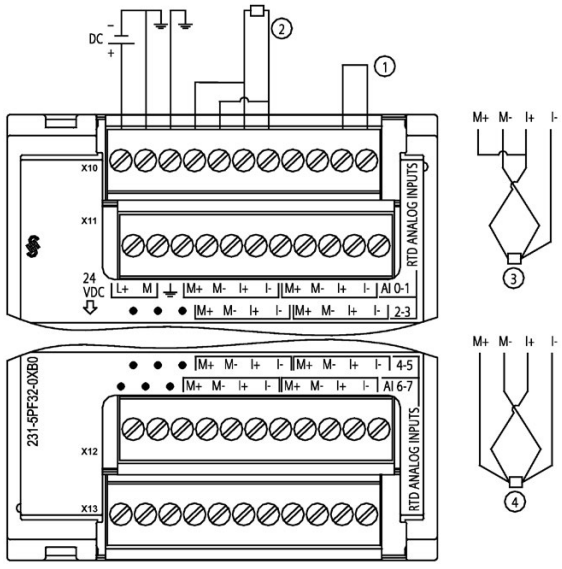
Table A- 174 Diagnostics

Technical data	SM 1231 AI 4 x RTD x 16 bit	SM 1231 AI 8 x RTD x16 bit
Overflow/underflow [1,2]	Yes	
Wire break [3]	Yes	
24 V DC low voltage [1]	Yes	

1 The overflow, underflow and low voltage diagnostic alarm information will be reported in the analog data values even if the alarms are disabled in the module configuration.

2 For resistance ranges underflow detection is never enabled.





3 When wire break alarm is disabled and an open wire condition exists in the sensor wiring, the module may report random values.

The SM 1231 RTD analog signal module measures the value of resistance connected to the module inputs. The measurement type can be selected as either "Resistor" or "Thermal resistor".

- "Resistor": The nominal range full scale value will be decimal 27648.
- "Thermal resistor": The value will be reported in degrees multiplied by ten (for example, 25.3 degrees will be reported as decimal 253). The climatic range values will be reported in degrees multiplied by one hundred (for example, 25.34 degrees will be reported as decimal 2534).

The SM 1231 RTD module supports measurements with 2-wire, 3-wire and 4-wire connections to the sensor resistor.

Table A- 175 Wiring diagrams for the RTD SMs

SM 1231 RTD 4 x 16 bit (6ES7231-5PD32-0XB0)	SM 1231 RTD 8 x 16 bit (6ES7231-5PF32-0XB0)
	

① Loop-back unused RTD inputs

② 2-wire RTD ③ 3-wire RTD ④ 4-wire RTD

NOTE: Connectors must be gold. See Appendix C, Spare Parts for article number.

Table A- 176 Connector Pin Locations for SM 1231 RTD 4 x 16 bit (6ES7231-5PD32-0XB0)

Pin	X10 (gold)	X11 (gold)	X12 (gold)	X13 (gold)
1	L+ / 24 V DC	No connection	No connection	No connection
2	M / 24 V DC	No connection	No connection	No connection
3	Functional Earth	No connection	No connection	No connection
4	AI 0 M+ /RTD	AI 1 M+ /RTD	AI 2 M+ /RTD	AI 3 M+ /RTD

6	AI 0 I+ /RTD	AI 1 I+ /RTD	AI 2 I+ /RTD	AI 3 I+ /RTD
7	AI 0 I- /RTD	AI 1 I- /RTD	AI 2 I- /RTD	AI 3 I- /RTD

Table A- 177 Connector Pin Locations for SM 1231 RTD 8 x 16 bit (6ES7231-5PF32-0XB0)

Pin	X10 (gold)	X11 (gold)	X12 (gold)	X13 (gold)
1	L+ / 24 V DC	No connection	No connection	No connection
2	M / 24 V DC	No connection	No connection	No connection
3	Functional Earth	No connection	No connection	No connection
4	AI 0 M+ /RTD	AI 2 M+ /RTD	AI 4 M+ /RTD	AI 6 M+ /RTD
5	AI 0 M- /RTD	AI 2 M- /RTD	AI 4 M- /RTD	AI 6 M- /RTD
6	AI 0 I+ /RTD	AI 2 I+ /RTD	AI 4 I+ /RTD	AI 6 I+ /RTD
7	AI 0 I- /RTD	AI 2 I- /RTD	AI 4 I- /RTD	AI 6 I- /RTD
8	AI 1 M+ /RTD	AI 3 M+ /RTD	AI 5 M+ /RTD	A7 M+ /RTD
9	AI 1 M- /RTD	AI 3 M- /RTD	AI 5 M- /RTD	AI 7 M- /RTD
10	AI 1 I+ /RTD	AI 3 I+ /RTD	AI 5 I+ /RTD	AI 7 I+ /RTD
11	AI 1 I- /RTD	AI 3 I- /RTD	AI 5 I- /RTD	AI 7 I- /RTD

Note

The RTD unused channels can be deactivated. No error will occur if an unused channel is deactivated.

The RTD module needs to have the current loop continuous to eliminate extra stabilization time which is automatically added to an unused channel that is not deactivated. For consistency the RTD module should have a resistor connected (like the 2-wire RTD connection).

	Cu 50	-240.0 °C	-200.0 °C	200.0 °C	240.0 °C	±0.7 °C	±1.4 °C
	Cu 100						

1 RTD values below the under-range minimum value report -32768.

2 RTD values above the over-range maximum value report +32767.

Table A- 179 Resistance

Range	Under range minimum	Nominal range low limit	Nominal range high limit	Over range maximum[1]	Normal range accuracy @ 25 °C	Normal range accuracy -20 °C to 60 °C
150 Ω	n/a	0 (0 Ω)	27648 (150 Ω)	176.383 Ω	±0.05%	±0.1%
300 Ω	n/a	0 (0 Ω)	27648 (300 Ω)	352.767 Ω	±0.05%	±0.1%
600 Ω	n/a	0 (0 Ω)	27648 (600 Ω)	705.534 Ω	±0.05%	±0.1%

[1] Resistance values above the over-range minimum value are reported as +32767.

Note

The module reports 32767 on any activated channel with no sensor connected. If open wire detection is also enabled, the module flashes the appropriate red LEDs.

When 500 Ω and 1000 Ω RTD ranges are used with other lower value resistors, the error may increase to two times the specified error.

Best accuracy will be achieved for the 10 Ω RTD ranges if 4 wire connections are used.

The resistance of the connection wires in 2 wire mode will cause an error in the sensor reading and therefore accuracy is not guaranteed.

Table A- 180 Noise reduction and update times for the RTD modules

Rejection frequency selection	Integration time	Update time (seconds)	
		4-channel module	8-channel module
400 Hz (2.5 ms)	10 ms [1]	4-/2-wire: 0.142 3-wire: 0.285	4-/2-wire: 0.285 3-wire: 0.525
60 Hz (16.6 ms)	16.67 ms	4-/2-wire: 0.222 3-wire: 0.445	4-/2-wire: 0.445 3-wire: 0.845
50 Hz (20 ms)	20 ms	4-/2-wire: 0.262 3-wire: .505	4-/2-wire: 0.524 3-wire: 1.015
10 Hz (100 ms)	100 ms	4-/2-wire: 1.222 3-wire: 2.445	4-/2-wire: 2.425 3-wire: 4.845

[1] To maintain module resolution and accuracy when the 400 Hz filter is selected, the integration time is 10 ms. This selection also rejects 100 Hz and 200 Hz noise.

Note

After power is applied, the module performs internal calibration for the analog-to-digital converter. During this time the module reports a value of 32767 on each channel until valid data is available on that channel. Your user program may need to allow for this initialization time. Because the configuration of the module can vary the length of the initialization time, you should verify the behavior or the module in your configuration. If required, you can include logic in your user program to accommodate the initialization time of the module.

Representation of Analog values for RTDs

A representation of the digitized measured value for the RTD standard temperature range sensors are shown in the tables below.

Table A- 181 Representation of analog values for resistance thermometers PT 100, 200, 500, 1000 and PT 10, 50, 100, 500 GOST (0.003850) standard

Pt x00 standard in °C (1 digit = 0.1 °C)	Units		Pt x00 standard in °F (1 digit = 0.1 °F)	Units		Range
	Decimal	Hexadecimal		Decimal	Hexadecimal	
> 1000.0	32767	7FFF	> 1832.0	32767	7FFF	Overflow
1000.0 : 850.1	10000 : 8501	2710 : 2135	1832.0 : 1562.1	18320 : 15621	4790 : 3D05	Overrange
850.0 : -200.0	8500 : -2000	2134 : F830	1562.0 : -328.0	15620 : -3280	3D04 : F330	Rated range
-200.1 : -243.0	-2001 : -2430	F82F : F682	-328.1 : -405.4	-3281 : -4054	F32F : F02A	Underrange
< -243.0	-32768	8000	< -405.4	-32768	8000	Underflow

A.12 Technology modules

A.12.1 SM 1278 4xIO-Link Master SM

Table A- 182 General specifications

Technical data		SM 1278 4xIO-Link Master signal module
Article number		6ES7278-4BD32-0XB0
Dimensions W x H x D (mm)		45 x 100 x 75
Weight		150 grams
General information		
	I&M data	Yes; IM0 to IM3
Supply voltage		
	Rated voltage (DC)	24 V DC
	Valid range low limit (DC)	19.2 V; 20.5 V if IO-Link is used (the supply voltage for IO-Link devices on the master must be at least 20 V)
	Valid range high limit (DC)	28.8 V DC
	Polarity reversal protection	Yes
Input current		
	Current consumption	65 mA; without load
Encoder supply		
	Number of outputs	4
	Output current, rated value	200 mA
Power loss		
	Power loss, typ.	1 W, excluding port loading
Digital inputs/outputs		
	Cable length (meters)	20 m, unshielded, max.
SDLC		
	Cable length (meters)	20 m, unshielded, max.
IO-Link		
	Number of ports	4
	Number of ports which can be controlled at the same time	4
	IO-Link protocol 1.0	Yes
	IO-Link protocol 1.1	Yes
Operating mode		
	IO-Link	Yes
	DI	Yes
	DQ	Yes; max. 100 mA

Technical data			SM 1278 4xIO-Link Master signal module
Connection of IO-Link devices			
	Port type A		Yes
		Transmission rate	4.8 kBd (COM1)
			38.4 kBd (COM2)
			230.4 kBd (COM3)
	Cycle time, min.		2 ms, dynamic, dependent on the user data length
	Size of process data, input per port		32 bytes; max.
	Size of process data, input per module		32 bytes
	Size of process data, output per port		32 bytes; max.
	Size of process data, output per module		32 bytes
	Memory size for device parameters		2 Kbytes
	Cable length unshielded, max. (meters)		20 m
Interrupts/diagnostics/status information			
	Status display		Yes
Interrupts			
	Diagnostic interrupt		Yes; port diagnostics is only available in IO-Link mode
Diagnostic alarms			
	Diagnostics		
		Monitoring of supply voltage	Yes
		Short circuit	Yes
Diagostic indicator LED			
	Monitoring of supply voltage		Yes; flashing red DIAG LED
	Channel status display		Yes; per channel one green LED for channel status Qn (SIO mode) and PORT status Cn (IO-Link mode)
	For channel diagnostics		Yes; red Fn LED
	For module diagnostics		Yes; green/red DIAG LED
Electrical isolation			
	Electrical isolation channels		
		Between the channels	No
		Between the channels and the backplane bus	Yes
Insulation			
	Insulation tested with		707 V DC (type test)
Ambient conditions			
	Operating temperature		
		Min.	-20 °C
		Max.	60 °C
		Horizontal installation, min.	-20 °C
		Horizontal installation, max.	60 °C
		Vertical installation, min.	-20 °C
		Vertical installation, max.	50 °C

A.12.1.1 SM 1278 4xIO-Link Master overview

The SM 1278 4xIO-Link Master is a 4-port module that functions as both a signal module and a communication module. Each port can operate in the IO-Link mode, single 24 V DC digital input or 24 V DC digital output.

The IO-Link master programs acyclic communication with an IO-Link device using the IO_LINK_DEVICE function block (FB) in your STEP 7 S7-1200 controller program. The IO_LINK_DEVICE FB indicates the IO-Link master your program uses, and which ports the master uses for data exchange.

Visit the Siemens Industry Online Support website (http://support.industry.siemens.com) for details on working with the IO-Link library. Enter "IO-Link" in the website's search box to access information about IO-Link products and their use.

View of the module

Properties

Technical properties

- IO-Link Master according to IO-Link specification V1.1 (see the IO-Link Consortium website (http://io-link.com/en/index.php) for details)
- Serial communication module with four ports (channels)
- Data transmission rate COM1 (4.8 kbaud), COM2 (38.4 kbaud), COM3 (230.4 kbaud)
- SIO mode (standard IO mode)
- Connection of up to four IO-Link devices (3-wire connection) or four standard actuators or standard encoders
- Programmable diagnostics function by port

Supported functions

- I&M (installation and maintenance) identification data
- Firmware update
- IO-Link parameter assignment by means of the S7-PCT port configuration tool, STEP 7 Professional, and an S7-1200 V4.0 or later CPU. In STEP 7 Professional, V15 (with the use of V2.1 HSP), IO-Link parameter assignment can be done using the TIA Portal with limited functionality.
- Port Qualifier Information (PQI) bits
- Backup and Restore using IO-Link library FBs

IO-Link is a point-to-point connection between a master and a device. Both conventional and intelligent sensors/actuators can be used as devices at the IO-Link via unshielded standard cables using proven 3-wire technology. IO-Link is backward compatible with conventional digital sensors and actuators. The circuit state and data channel are designed in proven 24 V DC technology.

For additional information about the SIMATIC-IO-Link technology, refer to the "IO-Link system Function Manual" on the Siemens Industry Online Support website (http://support.automation.siemens.com).

Note

IO-Link parameter data

When you replace the SM 4xIO-Link Master, the parameter data is not automatically assigned to it.

CAUTION

Removal and insertion

If you insert the SM 4xIO-Link Master with the load switched on, this can lead to dangerous conditions in your plant.

Physical damage to the S7-1200 automation system may occur as a result.

Remove or insert the SM 4xIO-Link Master only when the load is switched off.

Effects of resetting to the factory settings

Use the function "Reset to factory settings" to restore the parameter assignments you made with S7-PCT to the delivery state.

After a "Reset to factory settings", the parameters of the SM 1278 4xIO-Link module are assigned as follows:

- The ports are in DI mode
- The ports are mapped to the relative addresses 0.0 to 0.3
- The PortQualifier is disabled
- Maintenance data 1 to 3 is deleted

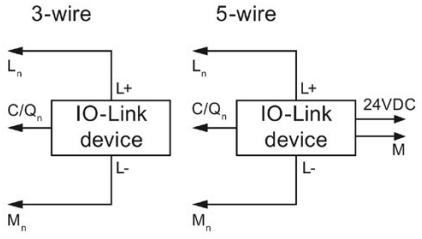
Note

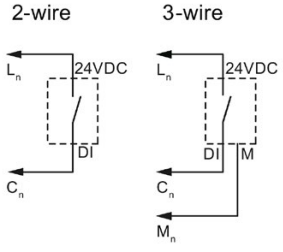
When you reset to factory settings, the device parameters are deleted and the delivery state is restored.

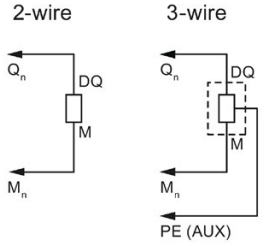
If you remove an SM 1278 4xIO-Link signal module, reset it to factory settings before you put it into storage.

Procedure

For "Reset to factory settings", proceed as described in the S7-PCT online help under "Master Configuration > 'Commands' tab".



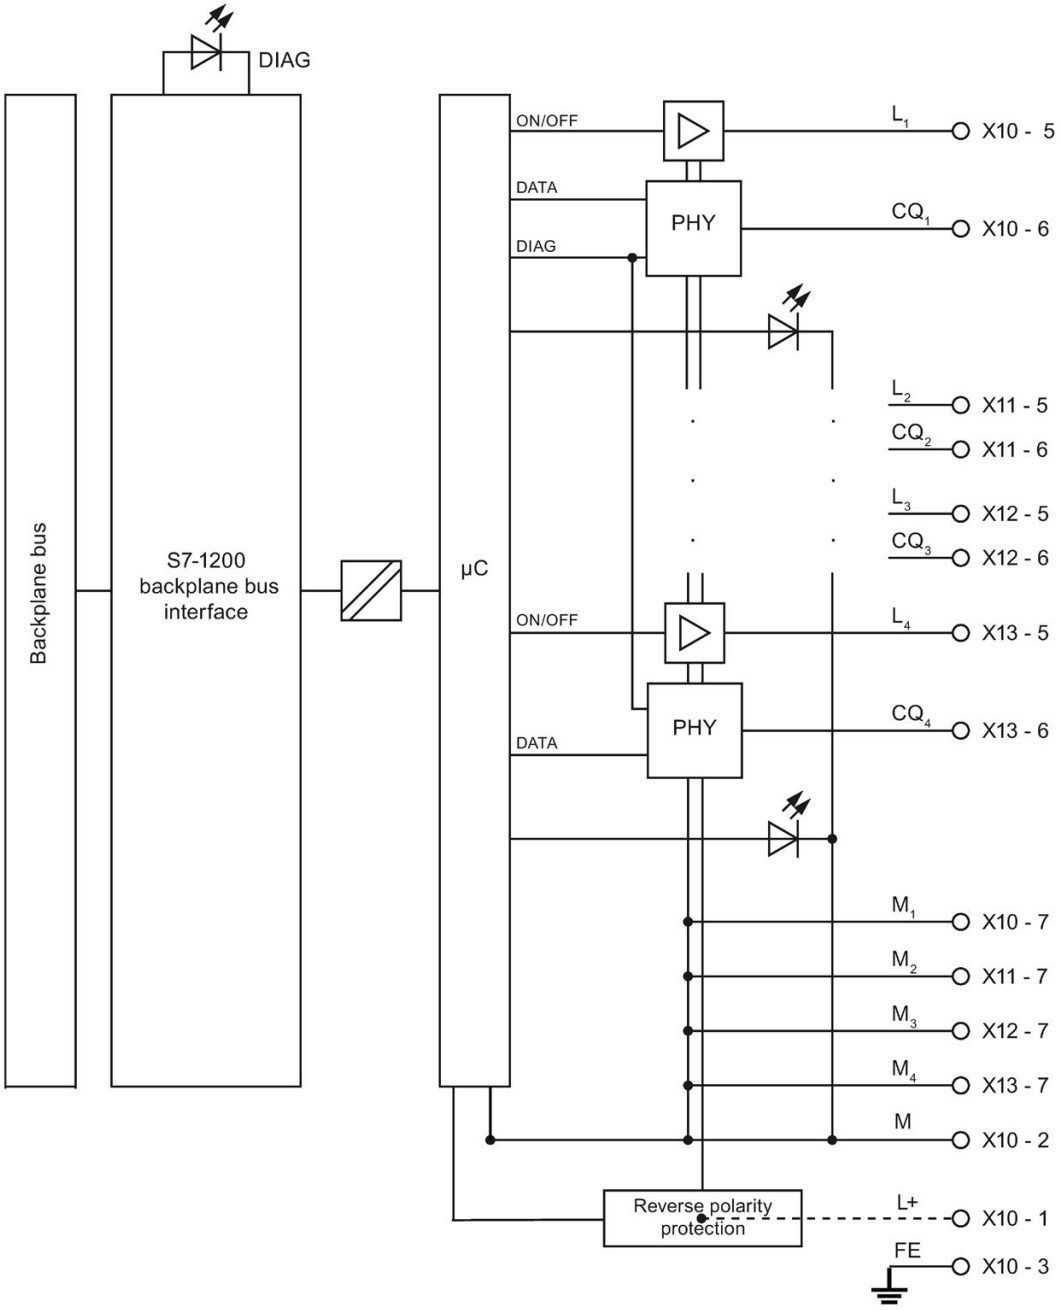




A.12.1.2 Connecting

For details about pin assignment, see table, Connector pin locations for SM 1278 I/O-Link Master (6ES 278-4BD32-0XB0). (Page 1474)

The following table shows the terminal assignments for the SM 1278 4xIO-Link Master:



Pin	X10	X11	X12	X13	Notes	BaseUnits
7	M_1	M_2	M_3	M_4	• M_n: ground to slave • C/Q_n: SDLC, DI or DQ • L_n: 24 V DC to slave • M: ground • L+: 24 V DC to Master • RES: reserved; may not be assigned	A1
6	C/Q_1	C/Q_2	C/Q_3	C/Q_4		
5	L_1	L_2	L_3	L_4		
4	RES	RES	RES	RES		
3	⏚ (functional earth)	RES	RES	RES		
2	M	RES	RES	RES		
1	L+	RES	RES	RES		

The following table contains illustrations of connection examples, where n = port number:

IO-Link operating mode	Operating mode DI	Operating mode DQ
		

Note

Connected sensors must use the device supply provided by the Master module L_n connection.

A.12.1.3 Parameters/address space

Configuring the SM 1278 4xIO-Link Master

For module integration, parameter assignment, and commissioning, you need STEP 7 V13 or later. For some features, you also need S7-PCT (Port Configuration Tool).

The table below shows the conditions when you need S7-PCT:

	SM 1278 V2.0 4xIO-Link Master	SM 1278 V2.1 4xIO-Link Master
STEP7 V13.x and STEP V14.x	S7-PCT required	S7-PCT required
STEP 7 15.x	S7-PCT required	S7-PCT not required for basic functions S7-PCT required for advanced functions.

For additional information, refer to the SIMATIC IO-Link system manual (https://support.industry.siemens.com/cs/ww/en/view/65949252).

The following table shows the parameters for the SM 1278 4xIO-Link Master:

Parameters	Value range	Default	Configuration in RUN	Efficiency range
Diagnostics port 1	• Disable • Enable	Disable	Yes	Port (channel)
Diagnostics port 2	• Disable • Enable	Disable	Yes	Port (channel)
Diagnostics port 3	• Disable • Enable	Disable	Yes	Port (channel)
Diagnostics port 4	• Disable • Enable	Disable	Yes	Port (channel)

Enable diagnostics for port 1 to port 4 parameter

This parameter allows diagnostics to be enabled for specific ports of the four IO-Link ports.

The port assignments are as follows:

Port 1 → channel 1

Port 2 → channel 2

Port 3 → channel 3

Port 4 → channel 4

The maximum size of the input and output addresses of the SM 4xIO-Link Master is 32 bytes in each case. You assign address spaces using the S7-PCT port configuration tool, or as of V15 V2.1 HSP, by using the TIA Portal hardware configuration.

Parameter data record

Parameter assignment in the user program

You can configure the device in runtime.

Changing parameters in runtime

The module parameters are included in data record 128. You can transmit the modifiable parameters to the module with the WRREC instruction.

When you reset (power cycle) the CPU, the CPU overwrites the parameters that were sent to the module by the WRREC instruction during the parameterization process.

Instruction for parameter assignment

The following instruction is provided for assigning parameters to the I/O module in the user program:

Instruction	Application
SFB 53 WRREC	Transfer of the alterable parameters to the module.

Error message

The following return value is reported in the event of an error:

Error code	Meaning
$80B1_H$	Error in data length
$80E0_H$	Error in header information
$80E1_H$	Parameter error

Data record structure

The following table shows the IO-Link parameters:

Offset	Label	Type	Default	Description
0	Version	1 byte	0x02	Shows the structure of the record 0x02 for the IO-Link Master in accordance with IO-Link V1.1
1	Parameter length	1 byte	0x02	Parameter length (2 bytes + 2 headers)
IO-Link start parameters				
2	Port diagnostics (Port1 1 to n)	1 byte	0x00	Activating the diagnostics for port 1 to n
3	IOL properties	1 byte	0x00	Module properties

The following table shows the data record version:

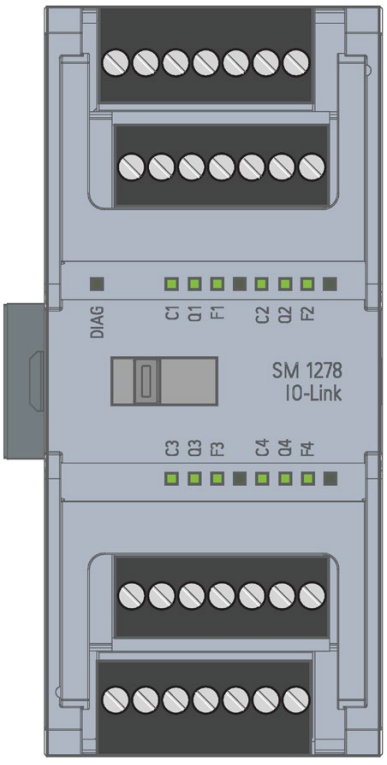
Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved		Major version (00)		Minor version (0010)			

The following table shows the data record port diagnostics:

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved				EN_Port4	EN_Port3	EN_Port2	EN_Port1

EN_Portx:

0 = Diagnostics deactivated



1 = Diagnostics activated

The following table shows the data record IOL properties:

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved							

A.12.1.4 Interrupt, error, and system alarms

LED display

Meaning of the LED displays

The following table explains the meaning of the status and error displays. You can find remedial measures for diagnostic alarms in the "Diagnostic alarms" section.

LED DIAG

DIAG	Meaning
▫ Off	Backplane bus supply of the S7-1200 not OK
☼ Flashes	Module is not configured
■ On	Module parameterized and no module diagnostics
☼ Flashes	Module parameterized and module diagnostics OR L+ power not connected

LED port status

Valid for IO-Link port which is in IO-Link port mode.

COM/1 ... COM/4	Meaning
▫ Off	Port deactivated
☼ Flashes	Port activated, device not connected or Port is not connected to the configured device
■ On	Port activated, device connected

LED channel status

Valid for IO-Link port which is in DI/Q mode.

DI/Q1 ... DI/Q4	Meaning
▫ Off	Process signal = 0
■ On	Process signal = 1

LED port error

F1 ... F4	Meaning
▫ Off	No error
■ On	Error

Module errors are indicated as diagnostics (module status) only in IO-Link mode.

Diagnostic alarm	Error code (decimal)	STATUS (W#16#...)	Meaning (IO-Link error code)	IO-Link master	IO-Link device
Short-circuit	1	1804	Short-circuit at the process cables on the IO-Link device	X	
		7710	Short-circuit on IO device		X
Undervoltage	2	5111 5112	Supply voltage too low		X
Overvoltage	3	5110	Supply voltage too high		X
Overheating	5	1805	Temperature exceeded on master	X	
		4000 4210	Temperature exceeded on device		X
Wire break	6	1800	• No IO-Link device connected • There is a break on the signal line to the IO-Link device • IO-Link device cannot communicate due to a different error	X	
Overflow	7	8C10 8C20	Process tag range exceeded		X
		8C20	Measuring range exceeded		
Underflow	8	8C30	Process tag range too low		X
Error	9	---	All IO-Link error codes that are not listed here are mapped to this PROFIBUS DP error		X
Parameter assignment error	16	1882 1883	IO-Link master could not be configured	X	
		1802	Incorrect device		
		1886	Storage error		
		6320 6321 6350	Device was not configured correctly		X
Supply voltage missing	17	1806	L+ supply voltage for device missing	X	
		1807	L+ supply voltage for device too low (<20 V)		
Defective fuse	18	5101	Fuse on device is defective		X

Diagnostic alarm	Error code (decimal)	STATUS (W#16#...)	Meaning (IO-Link error code)	IO-Link master	IO-Link device
Safety shut-down	25	1880	Serious error (master has to be re-placed)	X	
External fault	26	1809 180A 180B 180C 180D	Error in data storage	X	
		1808	More than 6 errors are pending simul-taneously on the IO-Link device		

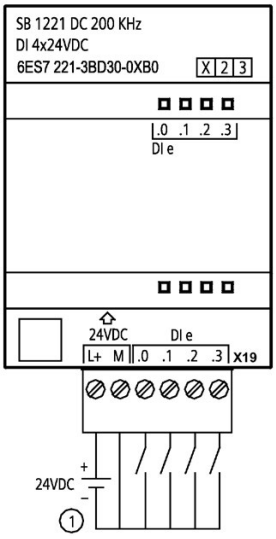
A.13 Digital signal boards (SBs)

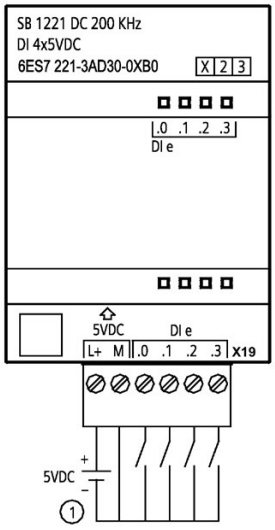
A.13.1 SB 1221 200 kHz digital input specifications

Table A- 185 General specifications

Technical data	SB 1221 DI 4 x 24 V DC, 200 kHz	SB 1221 DI 4 x 5 V DC, 200 kHz
Article number	6ES7221-3BD30-0XB0	6ES7221-3AD30-0XB0
Dimensions W x H x D (mm)	38 x 62 x 21	
Weight	35 grams	
Power dissipation	1.5 W	1.0 W
Current consumption (SM Bus)	40 mA	
Current consumption (24 V DC)	7 mA / input + 20 mA	15 mA / input + 15 mA

Table A- 186 Digital inputs





Technical data		SB 1221 DI 4 x 24 V DC, 200 kHz	SB 1221 DI 4 x 5 V DC, 200 kHz
Number of inputs		4	
Type		Source	
Rated voltage		24 V DC at 7 mA, nominal	5 V DC at 15 mA, nominal
Continuous permissible voltage		28.8 V DC	6 V DC
Surge voltage		35 V DC for 0.5 sec.	6 V
Logic 1 signal		0 V (10 mA) to L+ minus 10 V (2.9 mA)	0 V (20 mA) to L+ minus 2.0 V (5.1 mA)
Logic 0 signal		L+ minus 5 V (1.4 mA) to L+ (0 mA)	L+ minus 1.0 V (2.2 mA) to L + (0 mA)
HSC clock input rates (max.)		Single phase: 200 kHz Quadrature phase: 160 kHz	
Isolation (field side to logic)		707 V DC (type test)	
Isolation groups		1	
Filter times	us settings	0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0,12.8, 20.0	
	ms settings	0.05, 0.1, 0.2, 0.4, 0.8, 1.6, 3.2, 6.4, 10.0, 12.8, 20.0	
Number of inputs on simultaneously		• 2 (no adjacent points) at 60 °C horizontal or 50 °C vertical • 4 at 55 °C horizontal or 45 °C vertical	4
Cable length (meters)		50 shielded twisted pair	

Note

When switching frequencies above 20 kHz, it is important that the digital inputs receive a square wave. Consider the following options to improve the signal quality to the inputs:

- Minimize the cable length
- Change a driver from a sink only driver to a sinking and sourcing driver
- Change to a higher quality cable
- Reduce the circuit/components from 24 V to 5 V
- Add an external load at the input

Table A- 187 Wiring diagrams for the 200 kHz digital input SBs

SB 1221 DI 4 x 24 V DC, 200 kHz (6ES7221-3BD30-0XB0)	SB 1221 DI 4 x 5 V DC, 200 kHz (6ES7221-3AD30-0XB0)
	

① Supports sourcing inputs only

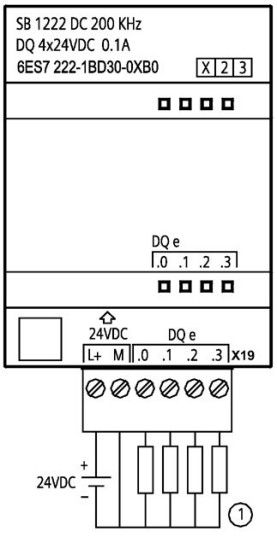
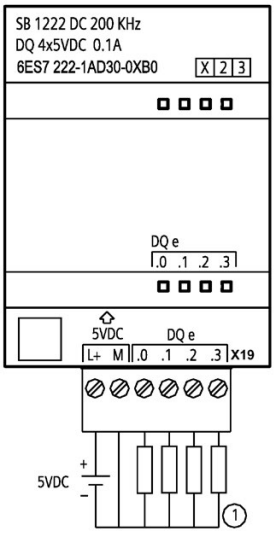
Dimensions W x H x D (mm)	38 x 62 x 21	
Weight	35 grams	
Power dissipation	0.5 W	
Current consumption (SM Bus)	35 mA	
Current consumption (24 V DC)	15 mA	

Table A- 191 Digital outputs

Technical data	SB 1222 DQ 4 x 24 V DC, 200 kHz	SB 1222 DQ 4 x 5 V DC, 200 kHz
Number of outputs	4	
Output type	Solid state - MOSFET sink and source[1]	
Voltage range	20.4 to 28.8 V DC	4.25 to 6.0 V DC
Logic 1 signal at max. current	L+ minus 1.5 V	L+ minus 0.7 V
Logic 0 signal at max. current	1.0 V DC, max.	0.2 V DC, max.
Current (max.)	0.1 A	
Lamp load	--	
On state contact resistance	11 Ω max.	7 Ω max.
Off state resistance	6 Ω max.	0.2 Ω max.
Leakage current per point	--	
Pulse Train Output rate	200 kHz max., 2 Hz min.	
Surge current	0.11 A	
Overload protection	No	
Isolation (field side to logic)	707 V DC (type test)	
Isolation groups	1	
Currents per common	0.4 A	
Inductive clamp voltage	Non	
Switching delay	1.5 µs + 300 ns rise 1.5 µs + 300 ns fall	200 ns + 300 ns rise 200 ns + 300 ns fall
Behavior on RUN to STOP	Last value or substitute value (default value 0)	

Technical data	SB 1222 DQ 4 x 24 V DC, 200 kHz	SB 1222 DQ 4 x 5 V DC, 200 kHz
Number of outputs on simultaneously	• 2 (no adjacent points) at 60 °C horizontal or 50 °C vertical • 4 at 55 °C horizontal or 45 °C vertical	4
Cable length (meters)	50 shielded twisted pair	





[1] Because both sinking and sourcing configurations are supported by the same circuitry, the active state of a sourcing load is opposite that of a sinking load. A source output exhibits positive logic (Q bit and LED are ON when the load has current flow), while a sink output exhibits negative logic (Q bit and LED are OFF when the load has current flow). If the module is plugged in with no user program, the default for this module is 0 V, which means that a sinking load will be turned ON.

Note

When switching frequencies above 20 kHz, it is important that the digital inputs receive a square wave. Consider the following options to improve the signal quality to the inputs:

- Minimize the cable length
- Change a driver from a sink only driver to a sinking and sourcing driver
- Change to a higher quality cable
- Reduce the circuit/components from 24 V to 5 V
- Add an external load at the input

Table A- 192 Wiring diagrams for the 200 kHz digital output SBs

SB 1222 DQ 4 x 24 V DC, 200 kHz (6ES7222-1BD30-0XB0)	SB 1222 DQ 4 x 5 V DC, 200 kHz (6ES7222-1AD30-0XB0)
	

① For sourcing outputs, connect "Load" to "-" (shown). For sinking outputs, connect "Load" to "+". Because both sinking and sourcing configurations are supported by the same circuitry, the active state of a sourcing load is opposite that of a sinking load. A source output exhibits positive logic (Q bit and LED are ON when the load has current flow), while a sink output exhibits negative logic (Q bit and LED are OFF when the load has current flow). If the module is plugged in with no user program, the default for this module is 0 V, which means that a sinking load will be turned ON.

Note

Ensure that the M connection wire is securely grounded. Loss of the ground wire connection to the high-speed DQ SBs may allow enough leakage current to activate a DC load. If the outputs are used for critical DC load applications, extra caution should be exercised by using a redundant ground wire to the SB.

Table A- 193 Connector pin locations for SB 1222 DQ 4 x 24 V DC, 200 kHz (6ES7222-1BD30-0XB0)

Pin	X19

A.14 Analog signal boards (SBs)

A.14.1 SB 1231 1 analog input specifications

Note

To use this SB, your CPU firmware must be V2.0 or higher.

Table A- 206 General specifications

Technical data	SB 1231 AI 1 x 12 bit
Article number	6ES7231-4HA30-0XB0
Dimensions W x H x D (mm)	38 x 62 x 21
Weight	35 grams
Power dissipation	0.4 W
Current consumption (SM Bus)	55 mA
Current consumption (24 V DC)	none

Table A- 207 Analog inputs

Technical data	SB 1231 AI 1x12 bit
Number of inputs	1
Type	Voltage or current (differential)
Range	±10 V, ±5 V, ±2.5 or 0 to 20 mA
Resolution	11 bits + sign bit
Full scale range (data word)	-27648 to 27648
Over/Under range (data word)	Voltage: 32511 to 27649 / -27649 to -32512 Current: 32511 to 27649 / 0 to -4864 (Refer to Analog input representation for voltage and Analog input representation for current (Page 1506).)
Overflow/Underflow (data word)	Voltage: 32767 to 32512 / -32513 to -32768 Current: 32767 to 32512 / -4865 to -32768 (Refer to Analog input representation for voltage and Analog input representation for current (Page 1506).)
Maximum withstand voltage / current	±35 V / ±40 mA
Smoothing	None, weak, medium, or strong (refer to Analog input response times for step response time (Page 1505).)
Noise rejection	400, 60, 50, or 10 Hz (refer to Analog input response times for sample rates (Page 1506).)
Accuracy (25 °C / -20 to 60 °C)	±0.3% / ±0.6% of full scale
Input impedance	Voltage: 150 kΩ; Current: 250 Ω
Behavior on RUN to STOP	Last value or substitute value (default value 0)

Technical data	SB 1231 AI 1x12 bit
Measuring principle	Actual value conversion
Common mode rejection	40 dB, DC to 60 Hz
Operational signal range	Signal plus common mode voltage must be less than +35 V and greater than -35 V
Isolation (field side to logic)	None
Cable length (meters)	100 m, twisted and shielded

Table A- 208 Diagnostics

Technical data	SB 1231 AI 1 x 12 bit
Overflow/underflow	Yes
24 V DC low voltage	no

SB 1231 wiring current transducers

Wiring current transducers are available as 2-wire transducers and 4-wire transducers as shown below.

2	AQ 0
3	Functional Earth
4	No connection
5	No connection
6	No connection

A.14.3 Measurement ranges for analog inputs and outputs

A.14.3.1 Step response of the analog inputs

Table A- 216 Step response (ms), 0 V to 10 V measured at 95%

Smoothing selection (sample averaging)	Integration time selection			
	400 Hz (2.5 ms)	60 Hz (16.6 ms)	50 Hz (20 ms)	10 Hz (100 ms)
None (1 cycle): No averaging	4.5 ms	18.7 ms	22.0 ms	102 ms
Weak (4 cycles): 4 samples	10.6 ms	59.3 ms	70.8 ms	346 ms
Medium (16 cycles): 16 samples	33.0 ms	208 ms	250 ms	1240 ms
Strong (32 cycles): 32 samples	63.0 ms	408 ms	490 ms	2440 ms
Sample time	**0.156 ms**	**1.042 ms**	**1.250 ms**	**6.250 ms**

A.14.3.2 Sample time and update times for the analog inputs

Table A- 217 Sample time and update time

Selection	Sample time	SB update time
400 Hz (2.5 ms)	0.156 ms	0.156 ms
60 Hz (16.6 ms)	1.042 ms	1.042 ms
50 Hz (20 ms)	1.250 ms	1.25 ms
10 Hz (100 ms)	6.250 ms	6.25 ms

A.14.3.3 Measurement ranges of the analog inputs for voltage and current (SB and SM)

Table A- 218 Analog input representation for voltage (SB and SM)

System		Voltage Measuring Range				
Decimal	Hexadecimal	±10 V	±5 V	±2.5 V	±1.25 V	
32767	7FFF[1]	11.851 V	5.926 V	2.963 V	1.481 V	Overflow
32512	7F00					
32511	7EFF	11.759 V	5.879 V	2.940 V	1.470 V	Overshoot range
27649	6C01					
27648	6C00	10 V	5 V	2.5 V	1.250 V	Rated range
20736	5100	7.5 V	3.75 V	1.875 V	0.938 V	
1	1	361.7 µV	180.8 µV	90.4 µV	45.2 µV	
0	0	0 V	0 V	0 V	0 V	
-1	FFFF					
-20736	AF00	-7.5 V	-3.75 V	-1.875 V	-0.938 V	
-27648	9400	-10 V	-5 V	-2.5 V	-1.250 V	
-27649	93FF					Undershoot range
-32512	8100	-11.759 V	-5.879 V	-2.940 V	-1.470 V	
-32513	80FF					Underflow
-32768	8000	-11.851 V	-5.926 V	-2.963 V	-1.481 V	

[1] 7FFF can be returned for one of the following reasons: overflow (as noted in this table), before valid values are available (for example immediately upon a power up), or if a wire break is detected.

Table A- 219 Analog input representation for current (SB and SM)

System		Current measuring range		
Decimal	**Hexadecimal**	**0 mA to 20 mA**	**4 mA to 20 mA**	
32767	7FFF	> 23.52 mA	> 22.81 mA	Overflow
32511	7EFF	23.52 mA	22.81 mA	Overshoot range
27649	6C01			
27648	6C00	20 mA	20 mA	Nominal range
20736	5100	15 mA	16 mA	
1	1	723.4 nA	4 mA + 578.7 nA	
0	0	0 mA	4 mA	
-1	FFFF			Undershoot range
-4864	ED00	-3.52 mA	1.185 mA	
32767[1]	7FFF		< 1.185 mA	Wire break (4 to 20 mA)
-32768	8000	< -3.52 mA		Underflow (0 to 20 mA)

[1] The wire break value of 32767 (16#7FFF) is always returned regardless of the state of the wire break alarm.

A.14.3.4 Measurement ranges of the analog outputs for voltage and current (SB and SM)

Table A- 220 Analog output representation for voltage (SB and SM)

System		Voltage Output Range	
Decimal	**Hexadecimal**	**± 10 V**	
32767	7FFF	See note 1	Overflow
32512	7F00	See note 1	
32511	7EFF	11.76 V	Overshoot range
27649	6C01		
27648	6C00	10 V	Rated range
20736	5100	7.5 V	
1	1	361.7 µ V	
0	0	0 V	
-1	FFFF	-361.7 µ V	
-20736	AF00	-7.5 V	
-27648	9400	-10 V	
-27649	93FF		Undershoot range
-32512	8100	-11.76 V	
-32513	80FF	See note 1	Underflow
-32768	8000	See note 1	

[1] In an overflow or underflow condition, analog outputs will take on the substitute value of the STOP mode.

Table A- 221 Analog output representation for current (SB and SM)

System		Current output range		
Decimal	**Hexadecimal**	**0 mA to 20 mA**	**4 mA to 20 mA**	
32767	7FFF	See note 1	See note 1	Overflow
32512	7F00	See note 1	See note 1	
32511	7EFF	23.52 mA	22.81 mA	Overshoot range
27649	6C01			
27648	6C00	20 mA	20 mA	Rated range
20736	5100	15 mA	16 mA	
1	1	723.4 nA	4 mA + 578.7 nA	
0	0	0 mA	4mA	
-1	FFFF		4 mA to 578.7 nA	Undershoot range
-6912	E500		0 mA	
-6913	E4FF			Not possible. Output value limited to 0 mA.
-32512	8100			
-32513	80FF	See note 1	See note 1	Underflow
-32768	8000	See note 1	See note 1	

[1] In an overflow or underflow condition, analog outputs will take on the substitute value of the STOP mode.

A.14.4 Thermocouple signal boards (SBs)

A.14.4.1 SB 1231 1 analog thermocouple input specifications

Note

To use this SB, your CPU firmware must be V2.0 or higher.

Table A- 222 General specifications

Technical data	SB 1231 AI 1 x 16 bit Thermocouple
Article number	6ES7231-5QA30-0XB0
Dimensions W x H x D (mm)	38 x 62 x 21
Weight	35 grams
Power dissipation	0.5 W
Current consumption (SM Bus)	5 mA
Current consumption (24 V DC)	20 mA

Table A- 223 Analog inputs

Technical data		SB 1231 AI 1x16 bit Thermocouple
Number of inputs		1
Type		Floating TC and mV
Range • Nominal range (data word) • Overrange/underrange (data word) • Overflow/underflow (data word)		See Thermocouple filter selection table (Page 1510).
Resolution	Temperature	0.1° C / 0.1° F
	Voltage	15 bits plus sign
Maximum withstand voltage		±35 V
Noise rejection		85 dB for the selected filter setting (10 Hz, 50 Hz, 60 Hz, 400 Hz)
Common mode rejection		> 120 dB at 120 V AC
Impedance		≥ 10 M Ω
Accuracy		See Thermocouple selection table (Page 1510).
Repeatability		±0.05% FS
Measuring principle		Integrating
Module update time		See Thermocouple filter selection table (Page 1510).
Cold junction error		±1.5° C
Isolation (field side to logic)		707 V DC (type test)
Cable length (meters)		100 m to sensor max.
Wire resistance		100 Ω max.

Table A- 224 Diagnostics

Technical data	SB 1231 AI 1 x 16 bit Thermocouple
Overflow/underflow[1]	Yes
Wire break[2, 3]	Yes

1 The overflow and underflow diagnostic alarm information will be reported in the analog data values even if the alarms are disabled in the module configuration.

2 When wire break alarm is disabled and an open wire condition exists in the sensor wiring, the module may report random values.

3 The module performs wire break testing every 6 seconds, which extends the update time by 9 ms for each enable channel once every 6 seconds.

The SM 1231 Thermocouple (TC) analog signal module measures the value of voltage connected to the module inputs.

The SB 1231 Thermocouple analog signal board measures the value of voltage connected to the signal board inputs. The temperature measurement type can be either "Thermocouple" or "Voltage".

- "Thermocouple": The value will be reported in degrees multiplied by ten (for example, 25.3 degrees will be reported as decimal 253).
- "Voltage": The nominal range full scale value will be decimal 27648.

A.14.4.2 Basic operation for a thermocouple

Thermocouples are formed whenever two dissimilar metals are electrically bonded to each other. A voltage is generated that is proportional to the junction temperature. This voltage is small; one microvolt could represent many degrees. Measuring the voltage from a thermocouple, compensating for extra junctions, and then linearizing the result forms the basis of temperature measurement using thermocouples.

When you connect a thermocouple to the SM 1231 Thermocouple module, the two dissimilar metal wires are attached to the module at the module signal connector. The place where the two dissimilar wires are attached to each other forms the sensor thermocouple.

Two more thermocouples are formed where the two dissimilar wires are attached to the signal connector. The connector temperature causes a voltage that adds to the voltage from the sensor thermocouple. If this voltage is not corrected, then the temperature reported will deviate from the sensor temperature.

Cold junction compensation is used to compensate for the connector thermocouple. Thermocouple tables are based on a reference junction temperature, usually zero degrees Celsius. The cold junction compensation compensates the connector to zero degrees Celsius. The cold junction compensation restores the voltage added by the connector thermocouples. The temperature of the module is measured internally, and then converted to a value to be added to the sensor conversion. The corrected sensor conversion is then linearized using the thermocouple tables.

For optimum operation of the cold junction compensation, the thermocouple module must be located in a thermally stable environment. Slow variation (less than 0.1 °C/minute) in ambient module temperature is correctly compensated within the module specifications. Air movement across the module will also cause cold junction compensation errors.

If better cold junction error compensation is needed, an external iso-thermal terminal block may be used. The thermocouple module provides for use of a 0 °C referenced or 50 °C referenced terminal block.

Selection table for the SB 1231 thermocouple

The ranges and accuracy for the different thermocouple types supported by the SB 1231 Thermocouple signal board are shown in the table below.

Table A- 225 Thermocouple selection table

Type	Under-range min-imum[1]	Nominal range low limit	Nominal range high limit	Over-range maxi-mum[2]	Normal range [3, 4] accuracy @ 25 °C	Normal range [1, 2] accuracy - 20 °C to 60 °C
J	-210.0 °C	-150.0 °C	1200.0 °C	1450.0 °C	±0.3 °C	±0.6 °C
	-346.0 °F	-238.0 °F	2192.0 °F	2642.0 °F	±0.5 °F	±1.1 °F
K	-270.0 °C	-200.0 °C	1372.0 °C	1622.0 °C	±0.4 °C	±1.0 °C
	-454.0 °F	-328.0 °F	2501.6 °F	2951.6 °F	±0.7 °F	±1.8 °F
T	-270.0 °C	-200.0 °C	400.0 °C	540.0 °C	±0.5 °C	±1.0 °C
	-454.0 °F	-328.0 °F	752.0 °F	1004.0 °F	±0.9 °F	±1.8 °F
E	-270.0 °C	-200.0 °C	1000.0 °C	1200.0 °C	±0.3 °C	±0.6 °C
	-454.0 °F	-328.0 °F	1832.0 °F	2192.0 °F	±0.5 °F	±1.1 °F
R & S	-50.0 °C	100.0 °C	1768.0 °C	2019.0 °C	±1.0 °C	±2.5 °C
	-58.0 °C	212.0 °F	3214.4 °F	3276.6 °F [5]	±1.8 °F	±4.5 °F
B	0.0 °C	200.0 °C	800.0 °C	--	±2.0 °C	±2.5 °C
	32.0 °F	392.0 °F	1472.0 °F	--	±3.6 °F	±4.5 °F
	--	800.0 °C	1820.0 °C	1820.0 °C	±1.0 °C	±2.3 °C
	--	1472.0 °F	3276.6 °F [5]	3276.6 °F [5]	±1.8 °F	±4.1 °F
N	-270.0 °C	-200.0 °C	1300.0 °C	1550.0 °C	±1.0 °C	±1.6 °C
	-454.0 °F	-328.0 °F	2372.0 °F	2822.0 °F	±1.8 °F	±2.9 °F
C	0.0 °C	100.0 °C	2315.0 °C	2500.0 °C	±0.7 °C	±2.7 °C
	32.0 °F	212.0 °F	3276.6 °F [5]	3276.6 °F [5]	±1.3 °F	±4.9 °F
TXK/XK(L)	-200.0 °C	-150.0 °C	800.0 °C	1050.0 °C	±0.6 °C	±1.2 °C
	-328.0 °F	302.0 °F	1472.0 °F	1922.0 °F	±1.1 °F	±2.2 °F

Type	Under-range min-imum[1]	Nominal range low limit	Nominal range high limit	Over-range maxi-mum[2]	Normal range [3, 4] accuracy @ 25 °C	Normal range [1, 2] accuracy - 20 °C to 60 °C
Voltage	-32512	-27648 -80mV	27648 80mV	32511	±0.05%	±0.1%

1 Thermocouple values below the under-range minimum value are reported as -32768.

2 Thermocouple values above the over-range maximum value are reported as 32767.

3 Internal cold junction error is ±1.5 °C for all ranges. This adds to the error in this table. The module requires at least 30 minutes of warm-up time to meet this specification.

4 In the presence of radiated radio frequency of 970 MHz to 990 MHz, the accuracy of the SM 1231 AI 4 x 16 bit TC may be degraded.

5 Lower limit of 3276.6 °F with °F reporting

Table A- 226 Filter selection table for the SB 1231 Thermocouple

Rejection frequency (Hz)	Integration time (ms)	Signal board update time (seconds)
10	100	0.306
50	20	0.066
60	16.67	0.056
400[1]	10	0.036

1 To maintain module resolution and accuracy when 400 Hz rejection is selected, the integration time is 10 ms. This selection also rejects 100 Hz and 200 Hz noise.

It is recommended for measuring thermocouples that a 100 ms integration time be used. The use of smaller integration times will increase the repeatability error of the temperature readings.

Note

After power is applied to the module, it performs internal calibration for the analog to digital converter. During this time, the module reports a value of 32767 on each channel until valid data is available on that channel. Your user program may need to allow for this initialization time.

A.14.5 RTD signal boards (SBs)

A.14.5.1 SB 1231 1 analog RTD input specifications

Note

To use this SB, your CPU firmware must be V2.0 or higher.

Table A- 229 General specifications

Technical data	SB 1231 AI 1 x 16 bit RTD
Article number	6ES7231-5PA30-0XB0
Dimensions W x H x D (mm)	38 x 62 x 2
Weight	35 grams
Power dissipation	0.7 W
Current consumption (SM Bus)	5 mA
Current consumption (24 V DC)	25 mA

Table A- 230 Analog inputs

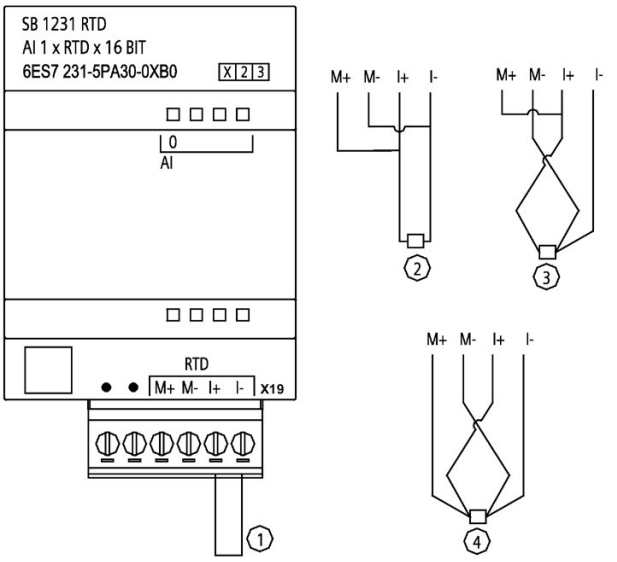
Technical data		SB 1231 AI 1 x 16 bit RTD
Number of inputs		1
Type		Module referenced RTD and Ohms
Range • Nominal range (data word) • Overrange/underrange (data word) • Overflow/underflow (data word)		See Selection tables (Page 1517).
Resolution	Temperature	0.1 °C/ 0.1 °F
	Voltage	15 bits plus sign
Maximum withstand voltage		±35 V
Noise rejection		85 dB (10 Hz, 50 Hz, 60 Hz, 400 Hz)
Common mode rejection		> 120 dB
Impedance		≥ 10 MΩ
Accuracy		See Selection tables (Page 1517).
Repeatability		±0.05% FS
Maximum sensor dissipation		0.5 m W
Measuring principle		Integrating
Module update time		See Selection table (Page 1517).
Isolation (field side to logic)		707 V DC (type test)
Cable length (meters)		100 m to sensor max.
Wire resistance		20 Ω, 2.7 for 10 Ω RTD max.

Table A- 231 Diagnostics

Technical data	SB 1231 AI 1 x 16 bit RTD
Overflow/underflow[1, 2]	Yes
Wire break [3]	Yes

1 The overflow and underflow diagnostic alarm information will be reported in the analog data values even if the alarms are disabled in the module configuration.

2 For resistance ranges underflow detection is never enabled.



3 When wire break alarm is disabled and an open wire condition exists in the sensor wiring, the module may report random values.

The SM 1231 RTD analog signal board measures the value of resistance connected to the signal board inputs. The measurement type can be selected as either "Resistor" or "Thermal resistor".

- "Resistor": The nominal range full scale value will be decimal 27648.
- "Thermal resistor": The value will be reported in degrees multiplied by ten (for example, 25.3 degrees will be reported as decimal 253). The climatic range values will be reported in degrees multiplied by one hundred (for example, 25.34 degrees will be reported as decimal 2534).

The SB 1231 RTD signal board supports measurements with 2-wire, 3-wire and 4-wire connections to the sensor resistor.

Table A- 232 Wiring diagram for SB 1231 AI 1 x 16 bit RTD

	Cu 50	-240.0 °C	-200.0 °C	200.0 °C	240.0 °C	±0.7 °C	±1.4 °C
	Cu 100						

1 RTD values below the under-range minimum value are reported as -32768.

2 RTD values above the over-range maximum value are reported as +32768.

Table A- 235 Resistance

Range	Under range minimum	Nominal range low limit	Nominal range high limit	Over range maximum[1]	Normal range accuracy @ 25 °C	Normal range accuracy -20 °C to 60 °C
150 Ω	n/a	0 (0 Ω)	27648 (150 Ω)	176.383 Ω	±0.05%	±0.1%
300 Ω	n/a	0 (0 Ω)	27648 (300 Ω)	352.767 Ω	±0.05%	±0.1%
600 Ω	n/a	0 (0 Ω)	27648 (600 Ω)	705.534 Ω	±0.05%	±0.1%

[1] Resistance values above the over-range maximum value are reported as 32767.

Note

The module reports 32767 on any activated channel with no sensor connected. If open wire detection is also enabled, the module flashes the appropriate red LEDs.

Best accuracy will be achieved for the 10 Ω RTD ranges if 4 wire connections are used.

The resistance of the connection wires in 2 wire mode will cause an error in the sensor reading and therefore accuracy is not guaranteed.

Table A- 236 Noise reduction and update times for the RTD modules

Rejection frequency selection	Integration time	4-/2-wire, 1-channel module Update time (seconds)	3-wire, 1-channel module Update time (seconds)
400 Hz (2.5 ms)	10 ms [1]	0.036	0.071
60 Hz (16.6 ms)	16.67 ms	0.056	0.111
50 Hz (20 ms)	20 ms	0.066	1.086
10 Hz (100 ms)	100 ms	0.306	0.611

[1] To maintain module resolution and accuracy when the 400 Hz filter is selected, the integration time is 10 ms. This selection also rejects 100 Hz and 200 Hz noise.

Note

After power is applied, the module performs internal calibration for the analog-to-digital converter. During this time the module reports a value of 32767 on each channel until valid data is available on that channel. Your user program may need to allow for this initialization time. Because the configuration of the module can vary the length of the initialization time, you should verify the behavior or the module in your configuration. If required, you can include logic in your user program to accommodate the initialization time of the module.

A.15 BB 1297 Battery board

BB 1297 Battery Board

The S7-1200 BB 1297 Battery Board is designed for long-term backup of the Real-time clock. It is pluggable in the signal board slot of the S7-1200 CPU (firmware 3.0 and later versions). You must add the BB 1297 to the device configuration and download the hardware configuration to the CPU for the BB to be functional.

The battery (type CR1025) is not included with the BB 1297 and must be purchased by the user.

Note

The BB 1297 is mechanically designed to fit the CPUs with the firmware 3.0 and later versions.

Do not use the BB 1297 with earlier version CPUs as the BB 1297 connector will not plug into the CPU.

WARNING

Installing an unspecified battery in the BB 1297, or otherwise connecting an unspecified battery to the circuit can result in fire or component damage and unpredictable operation of machinery.

Fire or unpredictable operation of machinery can result in death, severe personal injury, or property damage.

Use only the specified CR1025 battery for backup of the Real-time clock.

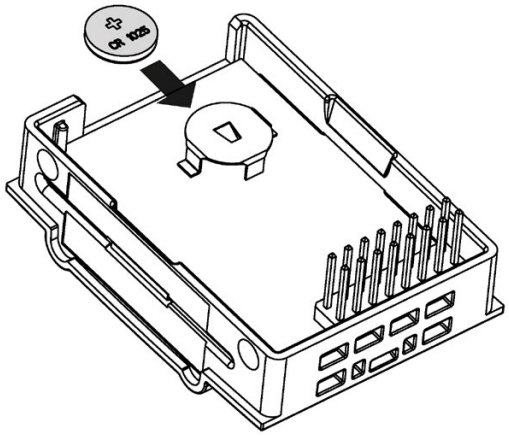

Table A- 237 General specifications

Technical data	BB 1297 Battery Board
Article number	6ES7297-0AX30-0XA0
Dimensions W x H x D (mm)	38 x 62 x 21
Weight	28 grams
Power dissipation	0.5 W
Current consumption (SM Bus)	11 mA
Current consumption (24 V DC)	none

Battery (not included)	BB 1297 Battery Board
Hold up time	Approximately 1 year
Battery type	CR1025 Refer to Installing or replacing a battery in the BB 1297 battery board (Page 62)
Nominal voltage	3 V
Nominal capacity	At least 30 mAH

Diagnostics	BB 1297 Battery Board
Critical battery level	< 2.5 V
Battery diagnostic	Low voltage indicator: • Low battery voltage causes the CPU MAINT LED to illuminate with the amber light continuously ON. • Diagnostic Buffer Event: 16#06:2700 "Submodule maintenance demanded: At least one battery exhausted (BATTF)"
Battery status	Battery status bit provided 0 = Battery OK 1 = Battery low
Battery status update	Battery status is updated at power up and then once per day while CPU is in RUN mode.

• Max. cable cross section	• max.: 1.5 mm^2 (AWG 15)
• Tightening torque of the screw terminals	• 0.45 Nm (4 lb-in)
Electrical isolation Power supply unit to internal circuit	710 V DC for 1 minute
Dimensions and weights	
• Width	• 30 mm
• Height	• 100 mm
• Depth	• 75 mm
Weight	
• Net weight	• 133 g
• Weight including packaging	• 170 g

Note

Preventing CPU interference from antennas

CPU interference can occur if antenna proximity is too close, or if you do not use recommended antennas. For recommended antennas, refer to Antenna ANT794-4MR for LTE/UMTS/GSM Compact Operating Instructions (https://support.industry.siemens.com/cs/ww/en/view/23119005) (available in English and German only).

A.16.2.2 GSM/GPRS antenna ANT794-4MR

Technical specifications of the ANT794-4MR GSM/GPRS antenna

ANT794-4MR	
Article number	6NH9860-1AA00
Mobile wireless networks	GSM/GPRS
Frequency ranges	• 824 to 960 MHz (GSM 850, 900) • 1 710 to 1 880 MHz (GSM 1 800) • 1 900 to 2 200 MHz (GSM / UMTS)
Characteristics	omnidirectional
Antenna gain	0 dB
Impedance	50 ohms
Standing wave ratio (SWR)	< 2,0
Max. power	20 W
Polarity	linear vertical
Connector	SMA
Length of antenna cable	5 m
External material	Hard PVC, UV-resistant
Degree of protection	IP20
Permitted ambient conditions • Operating temperature • Transport/storage temperature • Relative humidity	 • -40 °C through +70 °C • -40 °C through +70 °C • 100 %
External material	Hard PVC, UV-resistant
Construction	Antenna with 5 m fixed cable and SMA male connector
Dimensions (D x H) in mm	25 x 193
Weight • Antenna incl. cable • Fittings	 • 310 g • 54 g
Installation	With supplied bracket

A.16.2.3 Flat antenna ANT794-3M

Technical specifications of the flat antenna ANT794-3M

ANT794-3M		
Article number	6NH9870-1AA00	
Mobile wireless networks	**GSM 900**	**GSM 1800/1900**
Frequency ranges	890 - 960 MHz	1710 - 1990 MHz
Standing wave ratio (VSWR)	≤ 2:1	≤ 1,5:1
Return loss (Tx)	≈ 10 dB	≈ 14 dB
Antenna gain	0 dB	
Impedance	50 ohms	
Max. power	10 W	
Antenna cable	HF cable RG 174 (fixed) with SMA male connector	
Cable length	1.2 m	
Degree of protection	IP64	
Permitted temperature range	-40 °C to +75 °C	
Flammability	UL 94 V2	
External material	ABS Polylac PA-765, light gray (RAL 7035)	
Dimensions (W x L x H) in mm	70.5 x 146.5 x 20.5	
Weight	130 g	

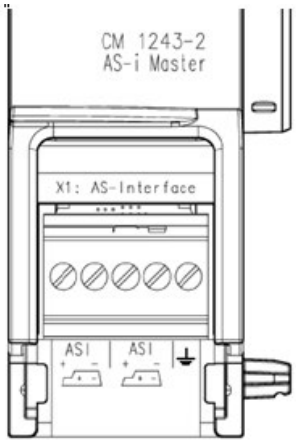
A.16.3 CM 1243-2 AS-i master

A.16.3.1 Technical data for the AS-i master CM 1243-2

Table A- 244 Technical data for the AS-i master CM 1243-2

Technical data	
Article number	3RK7243-2AA30-0XB0
Firmware version	V1.0
Date	01.12.2011
Interfaces	
Maximum current consumption From the S7-1200 backplane bus From the AS-i cable	 Max. 250 mA, supply voltage S7-1200 communication bus 5 V DC Max. 100 mA
Maximum current carrying capacity between the ASI+/ASI- terminals	8 A
Pin assignment	See section Electrical connections of the AS-i master (Page 1530)
Conductor cross-section	0.2 mm² (AWG 24) ... 3.3 mm² (AWG 12)

Technical data	
ASI connector tightening torque	0.56 Nm
Permissible ambient conditions	
Ambient temperature During storage During transport During the operating phase, with vertical installation (horizontal standard mounting rail) During the operating phase, with horizontal installation (vertical standard mounting rail)	 -40 °C ... 70 °C -40 °C ... 70 °C 0 °C ... 55 °C 0 °C ... 45 °C
Relative humidity at 25 °C during operating phase, no condensation, maximum	95 %
Degree of protection	IP20
Power supply, current consumption, power loss	
Type of power supply	DC
Current consumption (typically) From the S7-1200 backplane bus	 200 mA
Total power loss (typical): • From the S7-1200 backplane bus • From AS-i cable	 1 W 2.4 W
Dimensions and weights	
Width Height Depth	30 mm 100 mm 75 mm
Weight Net weight Weight including packaging	 122 g 159 g



A.16.3.2 Electrical connections of the AS-i master

Power supply of the AS-i master CM 1243-2

The AS-i master CM 1243-2 is supplied over the communications bus of the S7-1200. This means that a diagnostics message can still be sent to the S7-1200 following failure of the AS-i supply voltage. The connection to the communications bus is on the right-hand side of the AS-i master CM 1243-2.

AS-Interface terminals

The removable terminal for connecting the AS-i cable is located behind the lower cover on the front of the AS-i master CM 1243-2.

If the AS-i shaped cable is used, you can recognize the correct polarity of the cable by means of the symbol

Information on how to remove and re-install the terminal block can be found in the Installation chapter (Page 67).

Note

Maximum current carrying capacity of the terminal contacts

The current carrying capacity of the connection contacts is max. 8 A. If this value is exceeded on the AS-i cable, the AS-i master CM 1243-2 must not be "looped in" to the AS-i cable, but must instead be connected via a spur line (only one connection pair assigned on the AS-i master CM 1243-2).
Please also ensure that the cables used are suitable for operating temperatures of at least 75 °C if current is being conducted via the AS-i master and currents of greater than 4 amperes are present.
You will find additional information on connecting the AS-i cable in the section "Installation, connection and commissioning of the modules" in the manual "AS-i Master CM 1243-2 and AS-i data decoupling unit DCM 1271 for SIMATIC S7-1200".

Terminal assignment

Label	Meaning
ASI+	AS-i connection – positive polarity
ASI–	AS-i connection – negative polarity
	Functional ground

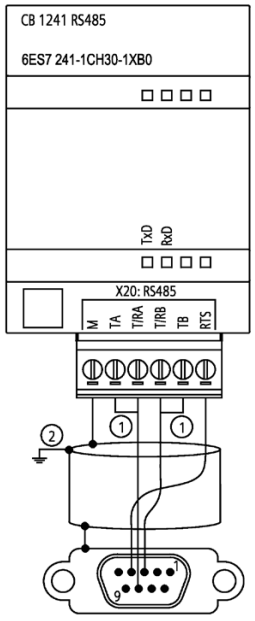
A.16.4 RS232, RS422, and RS485

A.16.4.1 CB 1241 RS485 specifications

Note

To use this CB, your CPU firmware must be V2.0 or higher.

Table A- 245 General specifications



Technical data	CB 1241 RS485
Article number	6ES7241-1CH30-1XB0
Dimensions W x H x D (mm)	38 x 62 x 21
Weight	40 grams

Table A- 246 Transmitter and receiver

Technical data	CB 1241 RS485
Type	RS485 (2-wire half-duplex)
Common mode voltage range	-7 V to +12 V, 1 second, 3 VRMS continuous
Transmitter differential output voltage	2 V min. at R_L = 100 Ω 1.5 V min. at R_L = 54 Ω
Termination and bias	10K to +5 V on B, RS485 Pin 3 10K to GND on A, RS485 Pin 4
Optional termination	Short Pin TB to Pin T/RB, effective termination impedance is 127 Ω, connects to RS485 Pin 3 Short Pin TA to Pin T/RA, effective termination impedance is 127 Ω, connects to RS485 Pin 4
Receiver input impedance	5.4K Ω min. including termination
Receiver threshold/sensitivity	+/- 0.2 V min., 60 mV typical hysteresis
Isolation RS485 signal to chassis ground RS485 signal to CPU logic common	707 V DC (type test)
Cable length, shielded	1000 m max.
Baud rate	300 baud, 600 baud, 1.2 kbits, 2.4 kbits, 4.8 kbits, 9.6 kbits (default), 19.2 kbits, 38.4 kbits, 57.6 kbits, 76.8 kbits, 115.2 kbits
Parity	No parity (default), even, odd, Mark (parity bit always set to 1), Space (parity bit always set to 0)
Number of stop bits	1 (default), 2
Flow control	Not supported
Wait time	0 to 65535 ms

Table A- 247 Power supply

Technical data	CB 1241 RS485
Power loss (dissipation)	1.5 W
Current consumption (SM Bus), max.	50 mA
Current consumption (24 V DC) max.	80 mA

CB 1241 RS485 (6ES7241-1CH30-1XB0)	
	
① Connect "TA" and TB" as shown to terminate the network. (Terminate only the end devices on the RS485 network.)	
② Use shielded twisted pair cable and connect the cable shield to ground.	

You terminate only the two ends of the RS485 network. The devices in between the two end devices are not terminated or biased. See the topic "Biasing and terminating an RS485 network connector" (Page 1068)

Table A- 248 Connector pin locations for CB 1241 RS485 (6ES7241-1CH30-1XB0)

Pin	9-Pin connector	X20
1	RS485 / Logic GND	--
2	RS485 / Not Used	--
3	RS485 / TxD+	4 - T/RB
4	RS485 / RTS	6 - RTS
5	RS485 / Logic GND	--

A.16.4.2 CM 1241 RS232 specifications

Table A- 249 General specifications

Technical data	CM 1241 RS232
Article number	6ES7241-1AH32-0XB0
Dimensions (mm)	30 x 100 x 75
Weight	150 grams

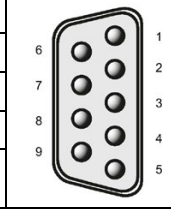

Table A- 250 Transmitter and receiver

Technical data	CM 1241 RS232
Type	RS232 (full-duplex)
Transmitter output voltage	+/- 5 V min. at R_L = 3K Ω
Transmit output voltage	+/- 15 V DC max.
Receiver input impedance	3 K Ω min.
Receiver threshold/sensitivity	0.8 V min. low, 2.4 max. high 0.5 V typical hysteresis
Receiver input voltage	+/- 30 V DC max.
Isolation RS 232 signal to chassis ground RS 232 signal to CPU logic common	707 V DC (type test)
Cable length, shielded	10 m max.
Baud rate	300 baud, 600 baud, 1.2 kbits, 2.4 kbits, 4.8 kbits, 9.6 kbits (default), 19.2 kbits, 38.4 kbits, 57.6 kbits, 76.8 kbits, 115.2 kbits
Parity	No parity (default), even, odd, Mark (parity bit always set to 1), Space (parity bit always set to 0)
Number of stop bits	1 (default), 2
Flow control	Hardware, software
Wait time	0 to 65535 ms

Table A- 251 Power supply

Technical data	CM 1241 RS232
Power loss (dissipation)	1 W
From +5 V DC	200 mA

Table A- 252 RS232 connector (male)

Pin	Description	Connector (male)	Pin	Description
1 DCD	Data carrier detect: Input		6 DSR	Data set ready: Input
2 RxD	Received data from DCE: Input		7 RTS	Request to send: Output
3 TxD	Transmitted data to DCE: Output		8 CTS	Clear to send: Input
4 DTR	Data terminal ready: Output		9 RI	Ring indicator (not used)
5 GND	Logic ground		SHELL	Chassis ground

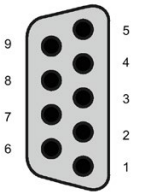
A.16.4.3 CM 1241 RS422/485 specifications

CM 1241 RS422/485 Specifications

Table A- 253 General specifications

Technical data	CM 1241 RS422/485
Article number	6ES7241-1CH32-0XB0
Dimensions W x H x H (mm)	30 x 100 x 75
Weight	155 grams

Table A- 254 Transmitter and receiver



Technical data	CM 1241 RS422/485
Type	RS422 or RS485, 9-pin sub D female connector
Common mode voltage range	-7 V to +12 V, 1 second, 3 VRMS continuous
Transmitter differential output voltage	2 V min. at R_L = 100 Ω 1.5 V min. at R_L = 54 Ω
Termination and bias	10K Ω to +5 V on B, PROFIBUS Pin 3 10K Ω to GND on A, PROFIBUS Pin 8 Internal bias options provided, or no internal bias. In all cases, external termination is required, see Biasing and terminating an RS485 network connector (Page 1068) and Configuring the RS422 and RS485 in the S7-1200 Programmable Controller System Manual (Page 1122)
Receiver input impedance	5.4K Ω min. including termination
Receiver threshold/sensitivity	+/- 0.2 V min., 60 mV typical hysteresis
Isolation RS485 signal to chassis ground RS485 signal to CPU logic common	707 V DC (type test)
Cable length, shielded	1000 m max. (baud rate dependent)
Baud rate	300 baud, 600 baud, 1.2 kbits, 2.4 kbits, 4.8 kbits, 9.6 kbits (default), 19.2 kbits, 38.4 kbits, 57.6 kbits, 76.8 kbits, 115.2 kbits
Parity	No parity (default), even, odd, Mark (parity bit always set to 1), Space (parity bit always set to 0)

Technical data	CM 1241 RS422/485
Number of stop bits	1 (default), 2
Flow control	XON/XOFF supported for the RS422 mode
Wait time	0 to 65535 ms

Table A- 255 Power supply

Technical data	CM 1241 RS422/485
Power loss (dissipation)	1.1 W
From +5 V DC	220 mA

Table A- 256 RS485 or RS422 connector (female)

Pin	Description	Connector (female)	Pin	Description
1	Logic or communication ground		6 PWR	+5 V with 100 ohm series resistor: Output
2 TxD+ [1]	Connected for RS422 Not used for RS485: Output		7	Not connected
3 TxD+ [2]	Signal B (RxD/TxD+): Input/Output		8 TXD- [2]	Signal A (RxD/TxD-): Input/Output
4 RTS [3]	Request to send (TTL level) Output		9 TXD- [1]	Connected for RS422 Not used for RS485: Output
5 GND	Logic or communication ground		SHELL	Chassis ground

[1] Pin 2 (TxD+) and Pin 9 (TxD-) are the RS422 transmit signals.

[2] Pin 3 (RxD/Tx+) and Pin 8 (RxD/TxD-) are RS485 transmit and receive signals. For RS422, Pin 3 is RxD+ and Pin 8 is RxD-.

[3] The RTS is a TTL level signal and can be used to control another half duplex device based on this signal. It is active when you transmit and is inactive all other times.

A.17 TeleService (TS Adapter and TS Adapter modular)

The following manuals contain the technical specification for the TS Adapter IE Basic and the TS Adapter modular:

- Industrial Software Engineering Tools
  Modular TS Adapter
- Industrial Software Engineering Tools
  TS Adapter IE Basic

For more information about this product and for the product documentation, refer to the product catalog web site for the TS Adapter (https://eb.automation.siemens.com/mall/en/de/Catalog/Search?searchTerm=TS%20Adapter%20IE%20basic&tab=).

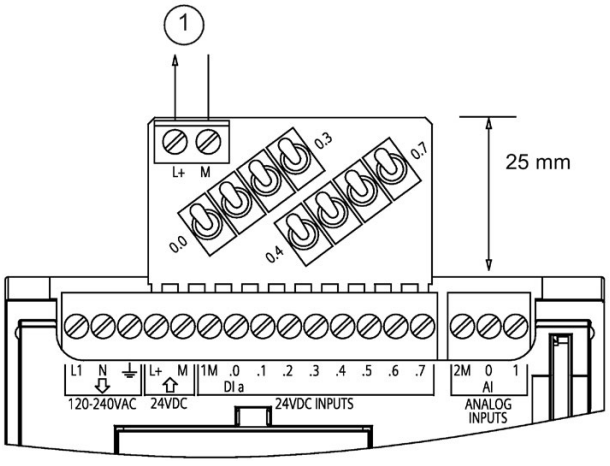
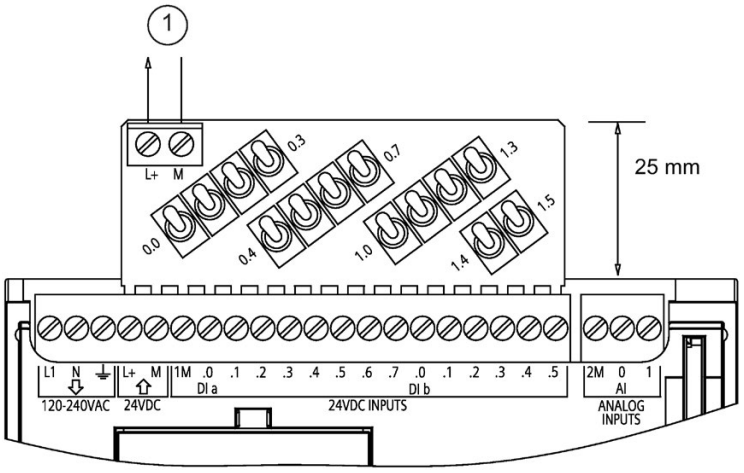
Used with CPU	CPU 1211C, CPU 1212C	CPU 1214C, CPU 1215C	CPU 1217C



WARNING

Safe use of input simulators

These input simulators are not approved for use in Class I DIV 2 or Class I Zone 2 hazardous locations. The switches present a potential spark hazard/explosion hazard if used in a Class I DIV 2 or Class I Zone 2 location. Unapproved use could result in death or serious injury to personnel, and/or damage to equipment.



Use these input simulators only in non-hazardous locations. Do not use in Class I DIV 2 or Class I Zone 2 hazardous locations.

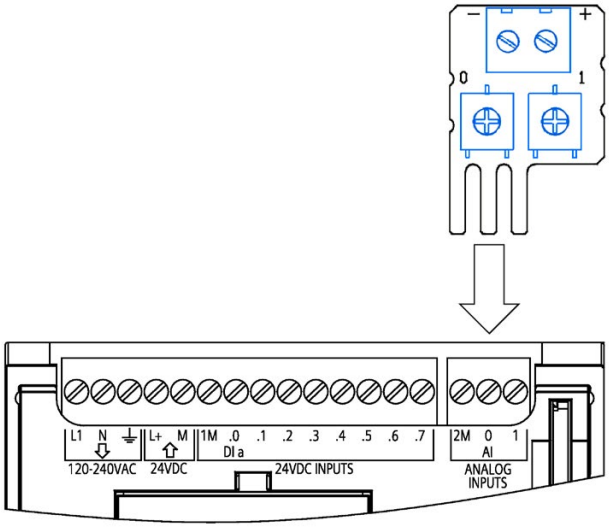
A.20 S7-1200 Potentiometer module

The S7-1200 Potentiometer module is an accessory for S7-1200 CPU. Each potentiometer creates an output voltage proportional to the position of the potentiometer to drive each of the two CPU analog inputs 0 V DC to 10 V DC. To install the potentiometer:



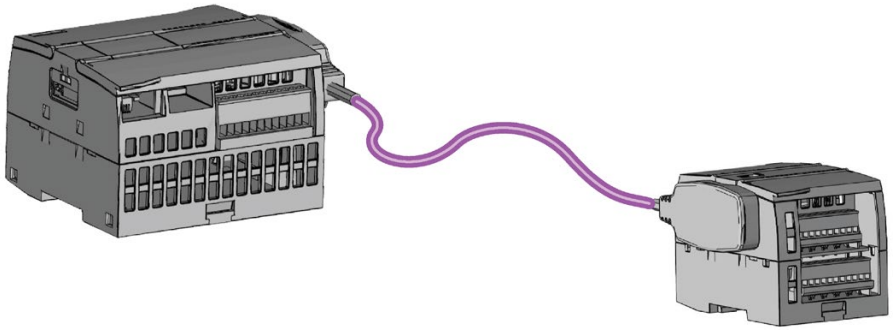
1. Insert the circuit board 'fingers' into any S7-1200 CPU analog input terminal block, and connect an external DC power supply to the 2-position connector on the potentiometer module.
2. Use a small screwdriver to make the adjustments: turn the potentiometer clockwise (to the right) to increase the voltage output, and counterclockwise (to the left) to decrease the voltage output.

Note

Follow ESD guidelines when handling the S7-1200 Potentiometer module.

Technical data	S7-1200 Potentiometer module
Article number	6ES7274-1XA30-0XA0
Used with CPU	All S7-1200 CPUs
Number of potentiometers	2
Dimensions W x H x D (mm)	20 x 33 x 14
Weight	26 grams
User-supplied voltage input at 2-position connector[1] (Class 2, Limited Power, or sensor power from PLC)	16.4 V DC to 28.8 V DC
Cable length (meters)/type	<30 m, shielded twisted pair
Input current consumption	10 mA max.
Potentiometer voltage output to S7-1200 CPU analog inputs[1]	0 V DC to 10.5 V DC min.
Isolation	Not isolated
Ambient temperature range	-20 °C to 60 °C

[1] Potentiometer module output voltage stability depends on the quality of the user-supplied voltage input at the 2-position connector - consider it as an analog input voltage.



A.21 I/O expansion cable

Table A- 258 Expansion cables

Technical Data	
Article number	6ES7290-6AA30-0XA0
Cable length	2 m
Weight	200 g

Refer to the installation section (Page 68) for information about installing and removing the S7-1200 expansion cable.

A.22 Companion products

A.22.1 PM 1207 power module

The PM 1207 is a power supply module for the SIMATIC S7-1200. It provides the following features:

- Input 120/230 V AC, output 24 V DC/2.5A

For more information about this product and for the product documentation, refer to the product catalog web site for the PM 1207 (https://mall.industry.siemens.com/mall/en/de/Catalog/Product/6EP1332-1SH71).

A.22.2 CSM 1277 compact switch module

The CSM1277 is an Industrial Ethernet compact switch module. It can be used to multiply the Ethernet interface of the S7-1200 to allow simultaneous communication with operator panels, programming devices, or other controllers. It provides the following features:

- 4 x RJ45 sockets for connecting to Industrial Ethernet
- 3 pole plug in terminal strip for connection of the external 24 V DC supply on top
- LEDs for diagnostics and status display of Industrial Ethernet ports
- Article number 6GK7277-1AA00-0AA0

For more information about this product and for the product documentation, refer to the product catalog web site for the CSM 1277 (https://eb.automation.siemens.com/mall/en/de/Catalog/Search?searchTerm=csm%201277&tab=).

A.22.3 CM CANopen module

The CM CANopen module is a plug-in module between the SIMATIC S7-1200 PLC and any device running CANopen. The CM CANopen can be configured to be both master or slave. There are two CM CANopen modules: the CANopen module (article number 021620-B), and the CANopen (Ruggedized) module (article number 021730-B).

The CANopen module provides the following features:

- Able to connect 3 modules per CPU
- Connects up to 16 CANopen slave nodes
- 256 byte input and 256 byte output per module
- 3 LEDs provide diagnostic information on module, network, and I/O status
- Supports storage of CANopen network configuration in the PLC
- The module is integratable in the hardware catalogue of the TIA Portal configuration suite
- CANopen configuration via included CANopen Configuration Studio (included) or via any other externanal CANopen configuration tool
- Complies to the CANopen communication profiles CiA 301 rev. 4.2 and the CiA 302 rev. 4.1
- Supports transparent CAN 2.0A for custom protocol handling
- Pre-made function blocks available for each PLC programming in TIA portal
- CM CANopen modules include; DSUB with screw terminals for subnetwork. CM CANopen configuration studio CD, and USB configuration cable

For more information about this product and for the product documentation, refer to the product catalog web site for the CM CANopen.

A.22.4 RF120C communications module

The RF10C allows Siemens RFID and code reading systems to be connected directly and easily to an S7-1200. The reader is connected to the RF120C via a point-to-point connecton. Up to three communications modules can be connected to an S7-1200 to the left of the CPU. The RF120C comminications module is configured via the TIA Portal. The article number for the RF120C communications module is 6GT2002-0LA00.

For more information about this product and for the product documentation, refer to the product catalog web site for the RF120C.

A.22.5 SM 1238 Energy meter module

The SM 1238 Energy Meter 480 V AC is designed for machine-level deployment in an S7-1200 system. It records over 200 different electrical measurement and energy values. It lets you create transparency about the energy requirements of individual components of a production plant down to the machine level. Using the measured values provided by the SM 1238 Energy meter module, you can determine energy consumption and power demand.

For more information about this product and for the product documentation and specifications, refer to the product catalog web site for the SM 1238 Energy meter module (https://support.industry.siemens.com/cs/ww/en/view/109483435).

A.22.6 SIWAREX electronic weighing systems

SIWAREX WP231, WP241, and WP251

The SIWAREX WP231, WP241, and WP251 electronic weighing systems can be used in the S7-1200. These modules use all the features of a modern automation system, such as integrated communication, operation and monitoring, the dignostic system as well as the configuration tools in the TIA Portal.

- The SIWAREX WP231 (https://support.industry.siemens.com/cs/us/en/view/90229056), calibrater weighing electronic (1 channel) for strain guage load cells / full bridges (1-4 MV/V) for SIMATIC S7-1200, RS485 and Ethernet - interface, onboard I/O: 4 DI / 4 DO, 1 AO (0/4...20 MA)
- The SIWAREX WP241 (https://support.industry.siemens.com/cs/ww/en/view/90229063), belt weigher electronic (1 channel) for strain guage load cells / full bridges (1-4 M/V) for SIMATIC S7-1200, RS485 and Ethernet-interface, onboard I/O: 4 DI / 4 DO, 1 AO (0/4...20 MA)
- The SIWAREX WP251, weighing electronic for batching and filling processes (1 channel) for strain guage load cells / full bridges (1-4 MV/V) for SIMATIC S7-1200, RS485 and Ethernet - interface, onboard I/O: 4 DI / 4 DO, 1 AO (0/4...20 MA),

SIWAREX WP251 (https://support.industry.siemens.com/cs/ww/en/view/109481751)

Calculating a power budget

B

The CPU has an internal power supply that provides power for the CPU itself, for any expansion modules, and for other 24 V DC user power requirements.

There are four types of expansion modules:

- Signal modules (SM) are installed on the right-side of the CPU. Each CPU allows a maximum number of signal modules possible without regard to the power budget.
  - CPU 1214C, CPU 1215C and CPU 1217C allows 8 signal modules
  - CPU 1212C allows 2 signal modules
  - CPU 1211C allows no signal modules
- Communication modules (CM) are installed on the left-side of the CPU. A maximum of 3 communication modules is allowed for any CPU without regard to the power budget.
- Signal boards (SB), communications boards (CB), and battery boards (BB) are installed on top of the CPU. A maximum of 1 signal board, communication board, or battery board is allowed for any CPU.

Use the following information as a guide for determining how much power (or current) the CPU can provide for your configuration.

Each CPU supplies both 5 V DC and 24 V DC power:

- The CPU provides 5 V DC power for the expansion modules when an expansion module is connected. If the 5 V DC power requirements for expansion modules exceed the power budget of the CPU, you must remove expansion modules until the requirement is within the power budget.
- Each CPU has a 24 V DC sensor supply that can supply 24 V DC for local input points or for relay coils on the expansion modules. If the power requirement for 24 V DC exceeds the power budget of the CPU, you can add an external 24 V DC power supply to provide 24 V DC to the expansion modules. You must manually connect the 24 V DC supply to the input points or relay coils.

WARNING

Connecting an external 24 V DC power supply in parallel with the DC sensor supply can result in a conflict between the two supplies as each seeks to establish its own preferred output voltage level.

The result of this conflict can be shortened lifetime or immediate failure of one or both power supplies, with consequent unpredictable operation of the PLC system. Unpredictable operation could result in death, severe personal injury and/or property damage.

The DC sensor supply on the CPU and any external power supply should provide power to different points. A single connection of the commons is allowed.

Some of the 24 V DC power input ports in the PLC system are interconnected, with a logic common circuit connecting multiple M terminals. The CPU 24 V DC power supply input, the SM relay coil power input, and a non-isolated analog power supply input are examples of circuits that are interconnected when designated as not isolated in the data sheets. All non-isolated M terminals must connect to the same external reference potential.

WARNING

Connecting non-isolated M terminals to different reference potentials will cause unintended current flows that may cause damage or unpredictable operation in the PLC and connected equipment.

Such damage or unpredictable operation could result in death, severe personal injury and/or property damage.

Always be sure that all non-isolated M terminals in a PLC system are connected to the same reference potential.

Information about the power budgets of the CPUs and the power requirements of the signal modules is provided in the technical specifications (Page 1343).

Note

Exceeding the power budget of the CPU may result in not being able to connect the maximum number of modules allowed for your CPU.

Example power budget

The following example shows a sample calculation of the power requirements for a configuration that includes one CPU 1214C AC/DC/Relay, one SB 1223 2 x 24 V DC Input/ 2 x 24 V DC Output, one CM 1241, three SM 1223 8 DC In/8 Relay Out, and one SM 1221 8 DC In. This example has a total of 48 inputs and 36 outputs.

Note

The CPU has already allocated the power required to drive the internal relay coils. You do not need to include the internal relay coil power requirements in a power budget calculation.

The CPU in this example provides sufficient 5 V DC current for the SMs, but does not provide enough 24 V DC current from the sensor supply for all of the inputs and expansion relay coils. The I/O requires 456 mA and the CPU provides only 400 mA. This installation requires an additional source of at least 56 mA at 24 V DC power to operate all the included 24 V DC inputs and outputs.

Table B- 1 Sample power budget

CPU power budget	**5 V DC**	**24 V DC**
CPU 1214C AC/DC/Relay	1600 mA	400 mA
Minus		
System requirements	**5 V DC**	**24 V DC**
CPU 1214C, 14 inputs	-	14 * 4 mA = 56 mA
1 SB 1223 2 x 24 V DC Input/ 2 x 24 V DC Output	50 mA	2 * 4 mA = 8 mA
1 CM 1241 RS422/485, 5 V power	220 mA	
3 SM 1223, 5 V power	3 * 145 mA = 435 mA	-
1 SM 1221, 5 V power	1 * 105 mA = 105 mA	-
3 SM 1223, 8 inputs each	-	3 * 8 * 4 mA = 96 mA
3 SM 1223, 8 relay coils each	-	3 * 8 * 11 mA = 264 mA
1 SM 1221, 8 inputs each	-	8 * 4 mA = 32 mA
Total requirements	810 mA	456 mA
Equals		
Current balance	**5 V DC**	**24 V DC**
Current balance total	790 mA	(56 mA)

Form for calculating your power budget

Use the following table to determine how much power (or current) the S7-1200 CPU can provide for your configuration. Refer to the technical specifications (Page 1343) for the power budgets of your CPU model and the power requirements of your signal modules.

Table B- 2 Calculations for a power budget

CPU power budget	**5 V DC**	**24 V DC**
Minus		
System requirements	**5 V DC**	**24 V DC**
Total requirements		
Equals		
Current balance	**5 V DC**	**24 V DC**
Current balance total

Replacing the terminal block connector

It is important to use the correct terminal block for your module. Refer to the tables below and your module specifications to determine the correct terminal block replacement.

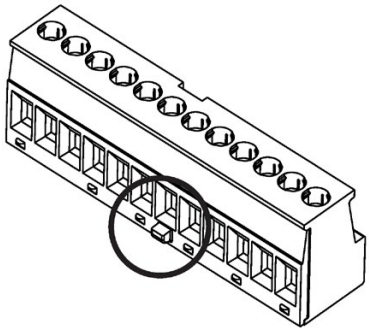
Note

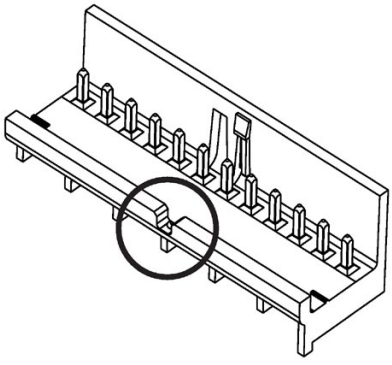
Keyed removable terminal blocks

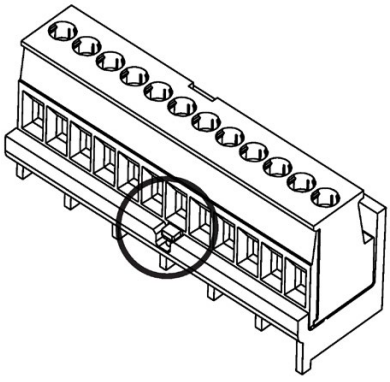
PLCs always require correct wiring to ensure safety and proper operation.

When replacing the terminal block in your CPU or SM, it is important that you use the correct terminal block and correct wiring source for your module.

The keyed feature helps prevent you from accidentally placing a high voltage wired terminal block into a low voltage module, or from placing a special voltage wired terminal block into a normal voltage module. Some terminal blocks are specifically keyed at left, at right or at middle.





Removable terminal block (keyed example shown	Key on device	Key on device only fits appropriate removable terminal block

Device exchange and spare parts compatibility

D

D.1 Exchanging a V3.0 CPU for a V4.2.x CPU

To upgrade a V3.0 CPU to a V4.2.x CPU, you must replace the CPU hardware. You cannot upgrade a V3.0 CPU to a V4.2.x CPU by firmware update.

Then in your STEP 7 project, you can replace your V3.0 CPU with a V4.2.x CPU (Page 164) and use your existing STEP 7 project that you designed for the V3.0 CPU.

When you replace a V3.0 CPU with a V4.2.x CPU, you might also want to check for and apply firmware updates (Page 144) to your connected signal and communication modules.

Note

No device exchange possible in STEP 7 from V4.2.x to V3.0

You can exchange a V3.0 CPU for a V4.2.x CPU, but you cannot exchange a V4.2.x CPU for a V3.0 CPU after you download the configuration. If you want to view or otherwise use your existing STEP 7 V3.0 project, make an archive of your STEP 7 V3.0 project prior to the device exchange.

Note that if you have not downloaded the exchanged device configuration, you can undo it. After downloading, however, you cannot undo the exchange from V3.0 to V4.2.x.

You need to be aware of some configuration and operational changes between the two CPU versions:

Upgrading STEP 7 projects

You cannot upgrade STEP 7 V11 or V12 projects directly to STEP 7 V15. You must first upgrade these projects to STEP 7 V13 SP1 or STEP 7 V13 SP2 . Then use that project as a basis for upgrade to STEP 7 V15.

WARNING

Risks with copying and pasting program logic from older versions of STEP 7

Copying program logic from an older version of STEP 7 such as STEP 7 V12 into STEP 7 V15 can cause unpredictable behavior in program execution or failures to compile. Different versions of STEP 7 implement program elements differently. The compiler does not always detect the differences if you made the changes by pasting from an older version into STEP 7 V15. Executing unpredictable program logic could result in death or severe personal injury if you do not correct the program.

When using program logic from a release of STEP 7 earlier than STEP 7 V15, always upgrade the entire project to STEP 7 V15. Then you can copy, cut, paste, and edit program logic as necessary. In STEP 7 V15, you can open a project from STEP 7 V13 SP1 or later. STEP 7 then performs the necessary compatibility conversions and upgrades the program correctly. Such upgrade conversions and corrections are necessary for proper program compilation and execution. If your project is older than STEP 7 V13 SP1, you must upgrade the project incrementally to STEP 7 V15.

Organization blocks

With V4.2.x, you can configure OB execution to be interruptible or non-interruptible (Page 103). For projects from former V3.0 CPUs, STEP 7 sets all OBs by default to be non-interruptible.

STEP 7 sets all OB priorities (Page 103) to the values they were in the V3.0 CPU STEP 7 project.

You can subsequently change the interruptability or priority settings if you choose.

The Diagnostic error interrupt OB (Page 96) start information references the submodule as a whole if no diagnostics event is pending.

CPU password protection

STEP 7 sets the password protection level (Page 204) for the V4.2.x CPU to be the equivalent password protection level that was set for the V3.0 CPU, and assigns the V3.0 password to the "Full access (no protection)" password for the V4.2.x CPU:

V3.0 protection level	V4.2.x access level
No protection	Full access (no protection)
Write protection	Read access
Write/read protection	HMI access

Note that the V4.2.x access level "No access (complete protection)" did not exist for V3.0.

Web server

If you use user-defined Web pages in your V3.0 project, store them in your project installation folder under the subfolder "UserFiles\Webserver" prior to upgrading your project. If you store your user-defined pages at this location, saving the STEP 7 project will also save the user-defined Web pages.

If you exchange a V3.0 CPU for a V4.2.x CPU, your Web server project setting (Page 983) for activating the Web server and HTTPS setting will be the same as it was in V3.0. You can then configure users, privileges, passwords (Page 984), and languages (Page 983) as needed to use the Web server. If you do not configure users with additional privileges, then you are limited as to what you can view from the standard Web pages (Page 991). The S7-1200 V4.2.x CPU does not support the former pre-configured "admin" user and password.

The S7-1200 V3.0 Web server Data log page provided a "Download and Clear" operation. The V4.2.x Web server File browser page (Page 1017), from which you access data logs, no longer provides this feature. Instead, the Web server provides the ability to download, rename, and delete data log files.

Transfer card incompatibility

You cannot use a V3.0 transfer card (Page 135) to transfer a V3.0 program to a V4.2.x CPU. You must open the V3.0 project in STEP 7, change the device to a V4.2.x CPU (Page 164), and download the STEP 7 project to your V4.2.x CPU. After you have changed your project to a V4.2.x project, you can then make a V4.2.x transfer card for subsequent program transfers.

GET/PUT communication

By default, S7-1200 V3.0 CPUs enabled GET/PUT communication. When you replace your V3.0 CPU with a V4.2.x CPU (Page 164), you see a message in the compatibility information section stating that GET/PUT is enabled.

Motion control support

S7-1200 V4.2.x CPUs do not support the V1.0 and V2.0 motion libraries. If you perform a device exchange for a STEP 7 project with V1.0 or V2.0 motion libraries, the device exchange substitutes compatible V3.0 motion control instructions (Page 714) for the V1.0 or V2.0 motion library instructions at compile.

If you perform a device exchange from a V3.0 CPU to a V4.2.x CPU for a STEP 7 project that contains two different motion control instruction versions (V3.0 and V5.0), the device exchange substitutes compatible V5.0 motion control instructions (Page 714) at compile.

During a device exchange from a V3.0 CPU to a V4.2.x CPU, the motion control Technological Object (TO) version does not automatically change from V3.0 to V5.0. If you want to upgrade to the later versions, you must go to the Instruction tree and select the required S7-1200 Motion Control version for your project as shown in the table below:

CPU version	Allowed motion control versions
V4.2.x (motion control V5.0)	V5.0 or V4.0 or V3.0
V4.1 (motion control V5.0)	V5.0 or V4.0 or V3.0
V4.0 (motion control V4.0)	V4.0 or V3.0
V3.0 (motion control V3.0)	V3.0

The TO structure is different between motion control versions V3.0 and V5.0. All associated blocks change as well. Block interfaces, watch tables, and traces update to the new motion control V5.0 structure. You can find the differences between the V3.0 CPU and V4.2.x CPU motion control axis parameters in the following two tables:

V3.0 CPU (Motion control V3.0)	V4.2.x CPU (Motion control V5.0)
Config.General.LengthUnit	Units.LengthUnit
Config.Mechanics.PulsesPerDriveRevolution	Actor.DriveParameter.PulsesPerDriveRevolution
Config.Mechanics.LeadScrew	Mechanics.LeadScrew
Config.Mechanics.InverseDirection	Actor.InverseDirection
Config.DynamicLimits.MinVelocity	DynamicLimits.MinVelocity
Config.DynamicLimits.MaxVelocity	DynamicLimits.MaxVelocity
Config.DynamicDefaults.Acceleration	DynamicDefaults.Acceleration
Config.DynamicDefaults.Deceleration	DynamicDefaults.Deceleration
Config.DynamicDefaults.EmergencyDeceleration	DynamicDefaults.EmergencyDeceleration
Config.DynamicDefaults.Jerk	DynamicDefaults.Jerk
Config.PositionLimits_SW.Active	PositionLimitsSW.Active
Config.PositionLimits_SW.MinPosition	PositionLimitsSW.MinPosition
Config.PositionLimits_SW.MaxPosition	PositionLimitsSW.MaxPosition
Config.PositionLimits_HW.Active	PositionLimitsHW.Active
Config.PositionLimits_HW.MinSwitchedLevel	PositionLimitsHW.MinSwitchLevel
Config.PositionLimits_HW.MaxSwitchedLevel	PositionLimitsHW.MaxSwitchLevel
Config.Homing.AutoReversal	Homing.AutoReversal
Config.Homing.Direction	Homing.ApproachDirection
Config.Homing.SideActiveHoming	Sensor[1].ActiveHoming.SideInput
Config.Homing.SidePassiveHoming	Sensor[1].PassiveHoming.SideInput
Config.Homing.Offset	Sensor[1].ActiveHoming.HomePositionOffset
Config.Homing.FastVelocity	Homing.ApproachVelocity
Config.Homing.SlowVelocity	Homing.ReferencingVelocity
MotionStatus.Position	Position
MotionStatus.Velocity	Velocity
MotionStatus.Distance	StatusPositioning.Distance
MotionStatus.TargetPosition	StatusPositioning.TargetPosition

V3.0 CPU (Motion control V3.0)	V4.2.x CPU (Motion control V5.0)
StatusBits.SpeedCommand	StatusBits.VelocityCommand
StatusBits.Homing	StatusBits.HomingCommand

The only "commandtable" parameter that is renamed is the array with the commands:

V3.0	V4.2.x
Config.Command[]	Command[]

Note: The array "Command[]" is a UDT of the type "TO_CmdTab_Config_Command" in V3.0 and "TO_Struct_Command" in V4.2.x.

Instruction changes

The following instructions have changes in parameters or behavior:

- RDREC and WRREC (Page 375)
- CONV (Page 285)

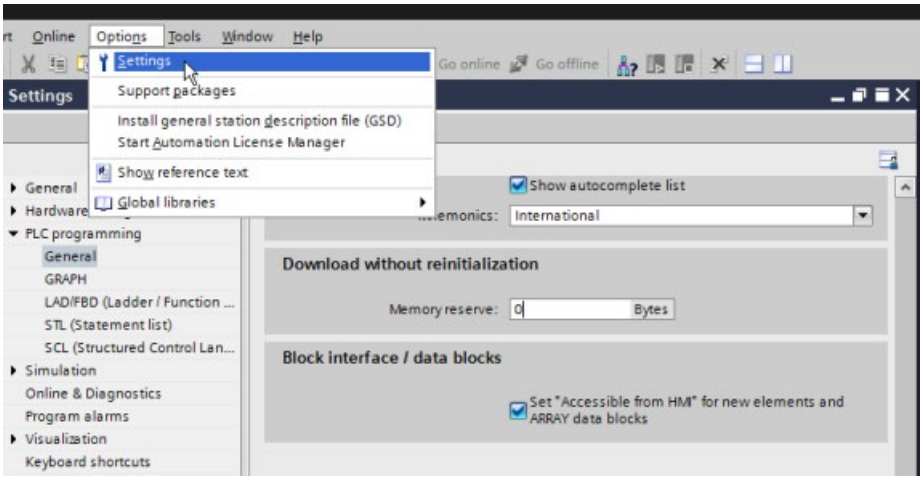
HMI panel communication

If you had one or more HMI panels (Page 33) connected to your S7-1200 V3.0 CPU, the communication to the S7-1200 V4.2.x CPU depends on the type of communication you use and the firmware version of the HMI panel. Recompile and download your project to the CPU and the HMI and/or update your HMI firmware.

Requirement to recompile program blocks

After exchanging a V3.0 CPU for a V4.2.x CPU, you must recompile all program blocks before you can download them to the V4.2.x CPU. Additionally, if any of the blocks have know-how protection (Page 207) or copy protection bound to a PLC serial number (Page 208), you must remove the protection before you compile and download the blocks. (You do not, however, need to deactivate copy protection bound to a memory card.) After a successful compile, you can reconfigure the know-how protection and/or PLC serial number copy protection. Note that if your project includes any blocks with know-how protection that an OEM (Original Equipment Manufacturer) provided, you must contact the OEM to provide V4.2.x versions of those blocks.

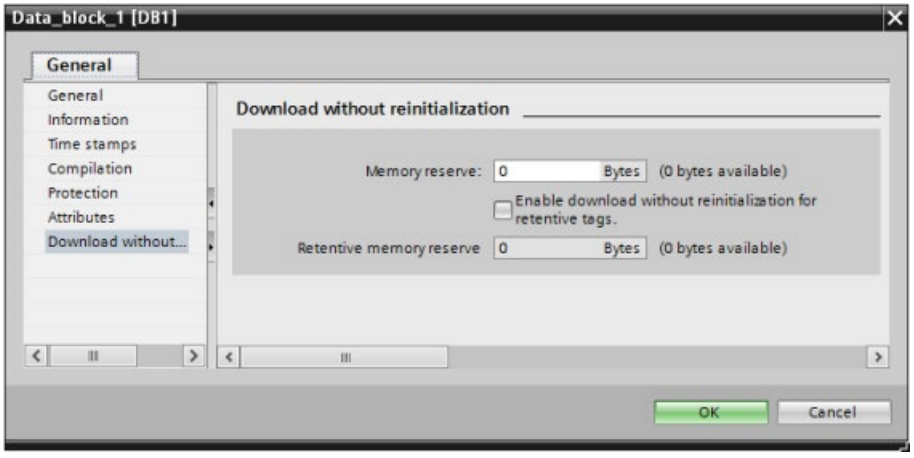
In general, Siemens recommends that you recompile the hardware configuration and software in STEP 7 and download to all devices in your project after the device exchange. Correct any errors that compiling the project finds, and recompile until you have no errors. Then, you can download the project to the V4.2.x CPU.



S7-1200 V3.0 projects might not fit in S7-1200 V4.2.x CPUs

S7-1200 V4.0 and later added a reserve area of 100 bytes to each DB to support download without reinitialization.

You can remove the 100-byte reserve area from DBs prior to attempting to download a V3.0 project to a V4.2.x CPU.



To remove the 100-byte reserve area, follow these steps before you perform the device exchange:

1. From the TIA Portal main menu, select the Options > Settings menu command.
2. From the navigation tree, open the PLC programming > General node.
3. In the "Download without reinitialization" area, set the memory reserve to 0 bytes.

If you have already performed the device exchange, you must remove the 100-byte reserve from each block individually:

1. From the project tree, right-click a data block from the Program blocks folder and select Properties from the shortcut menu.
2. In the Data block properties dialog, select the "Download without reinitialization" node.
3. Set the memory reserve to 0 bytes.
4. Repeat for each data block in your project.

Note

Projects for V4.0 and V4.1 CPUs can run without modification in V4.2.x CPUs.

AWP_Import_Fragment, 1033
AWP_In_Variable, 1024, 1028
AWP_Out_Variable, 1026
AWP_Start_Fragment, 1032

B

Backing up a CPU, 1339
Basic panels (HMI), 33
Battery board (BB)
BB 1297, 1520
inserting battery, 1521
Baud rate, 1074
BB 1297, 1520
Binding to a CPU, memory card, or password, 208
Bit logic
AND, OR, and XOR instructions, 222
normally open and closed coils, 223
normally open and closed contacts, 221
NOT instruction (invert RLO), 223
positive and negative edge instructions, 227
set and reset instructions, 224
Blocks
block calls, 83
calling an FB or FC with SCL, 196
consistency check, 219
copying blocks from an online CPU, 215
counters (quantity and memory requirements), 30, 1358, 1371, 1384, 1398, 1414
data block (DB), 83
download, 210
events, 103
function (FC), 83, 184
function block (FB), 83, 185
initial value of an FB, 185
instance data block (DB), 185
interrupts, 30, 103, 1358, 1371, 1384, 1398, 1414
linear and structured programs, 180
monitoring, 30, 1358, 1371, 1384, 1398, 1414
nesting
depth, 30, 83, 1358, 1371, 1384, 1398, 1414
number of code
blocks, 30, 1358, 1371, 1384, 1398, 1414
number of
OBs, 30, 103, 1358, 1371, 1384, 1398, 1414
organization blocks
(OBs), 30, 83, 92, 103, 1358, 1371, 1384, 1398, 14
14
password protection, 207

single instance or multi-instance DB, 185
size of the user
program, 30, 83, 1358, 1371, 1384, 1398, 1414
start-up OBs, 103
timers (quantity and memory
requirements), 30, 1358, 1371, 1384, 1398, 1414
types of, 83
types of code blocks, 83
valid FC, FB, and DB numbers, 83
Boolean or bit values, 115
Break, 1077, 1078
Browsers supported for Web server, 982
BUFFER parameter, SEND_P2P, 1107
Bus connector, 32

C

Cable
expansion, 1542
Network communication, 1068
CALCULATE (calculate), 249
scaling analogs, 43
using for complex equations, 42
Calendar, 329
Call structure, 219
Call structure local memory allocation, 118
Calling code blocks within the user program, 182
CAN_DINT (cancel time-delay interrupt), 420
CAN_TINT (cancel time of day interrupt), 417
CANopen modules
021620-B, 021630-B, 1543
Capturing values from an online DB, 1313
Cascading PID controllers, 602
CB 1241
termination and bias, 1069
CB 1241 RS485, 1533
CE approval, 1344
CEIL (generate next higher integer from floating-point number), 290
Certificate Import Wizard, 1063
Change device, 164
Changing settings for STEP 7, 45
Char (character data type), 127
Character position, message length, 1084
Character sequence
message end, 1082
message start, 1078
Chars_TO_Strg (convert array of CHAR to character string), 349
Checking the connection, 859
Clearance, airflow and cooling, 55
Clock
RD_LOC_T (read local time), 332
RD_SYS_T (read time-of-day), 332
time-of-day clock, 113
WR_LOC_T (set local time), 332
WR_SYS_T (set time-of-day), 332
Clock memory byte, 111
Closed loop motion control
analog drive, 656
configuring the axis, 656
PROFIdrive, 656
Code block
binding to a CPU, memory card, or password, 208
block calls, 83
calling code blocks within the user program, 182
copy protection, 208
counters (quantity and memory
requirements), 30, 1358, 1371, 1384, 1398, 1414
DB (data block), 83, 186
FB (function block), 83, 185
FC (function), 83, 184
initial value of an FB, 185
instance data block (DB), 185
interrupts, 30, 1358, 1371, 1384, 1398, 1414
know-how protection, 207
linear and structured programs, 180
monitoring, 30, 1358, 1371, 1384, 1398, 1414
nesting depth, 30, 1358, 1371, 1384, 1398, 1414
number of code
blocks, 30, 1358, 1371, 1384, 1398, 1414
number of OBs, 30, 1358, 1371, 1384, 1398, 1414
organization blocks
(OBs), 30, 183, 1358, 1371, 1384, 1398, 1414
size of the user
program, 30, 1358, 1371, 1384, 1398, 1414
timers (quantity and memory
requirements), 30, 1358, 1371, 1384, 1398, 1414
types of code blocks, 83
valid FC, FB, and DB numbers, 83
Coils, (See Bit logic)
Cold junction compensation, thermocouple, 1464, 1510
Columns and headers in task cards, 45
Commissioning
PID_Compact and PID_3Step instructions, 625
PID_Temp instruction, 627
Communication
active/passive, 788, 811, 972

legacy TRCV_C (receive data via Ethernet (TCP)), 829
legacy TSEND_C (send data via Ethernet (TCP)), 829
MAC address, 795
network connection, 787
number of communication connections, 784
overview, 805
PRVREC (make data record available), 401
PUT (write data to a remote CPU), 965
RALRM (receive interrupt), 383
RCVREC (receive data record), 399
RDREC (read data record), 375
T_CONFIG (configure interface), 880
TCON, 837
TDISCON, 837
TRCV, 837
TRCV_C, 817
TSEND, 837
TSEND_C, 817
TURCV (receive data via Ethernet (UDP)), 874
TUSEND (send data via Ethernet (UDP)), 874
types of communication, 781
WRREC (write data record), 375
Ethernet protocols, 805
multi-node connections, 970
Event execution and queueing, 103
Example
adding a SINAMICS S120 drive, 669
configuring edge detection on a position limit or input homing switch, 700
selecting a passive motion reference point switch level, 710
selecting an active motion reference point switch level, 711
Examples, communication
AS-i slave addressing, 958
configuring a PROFIBUS S7 connection, 977
configuring a PROFINET S7 connection, 975
CPU communication over TSEND_C or TRCV_C connections, 811
CPU communication with a common send and receive connection, 810
CPU communication with separate send and receive connections, 809
I-device as IO device and IO controller, 908
PROFINET communication protocols, 805
shared device, 917
shared I-device, 923
T_CONFIG, changing IP parameters, 887
T_CONFIG, changing IP parameters and PROFINET IO device names, 888
T_CONFIG, changing IP parameters of the NTP servers, 889
telecontrol, 1281
Examples, instructions
ATH (ASCII to hexadecimal), 352
CALCULATE, 42
CONTINUE, SCL, 317
CTRL_PWM, 482
DECO (Decode), 322
Deserialize, 265
DeviceStates, PROFIBUS and PROFINET, 456
EXIT, SCL, 318
GET_DIAG and modes, 471
GOTO (SCL), 319
HTA (Hexadecimal to ASCII), 352
LIMIT (set limit value), 257
ModuleStates, PROFIBUS and PROFINET, 462
PEEK and POKE variations, 200, 276
RETURN, SCL, 319
ROR (Rotate right), SCL, 327
RUNTIME (Measure program runtime), 310
S_CONV (convert character string), 347
Serialize, 268
SET_CINT cyclic interrupt execution and time parameter, 412
SHL (Shift left), SCL, 326
STRG_VAL (convert string to numerical value), 348
SWAP (swap bytes), 271
timer coils, 232
TM_MAIL, 1292
VAL_STRG (convert numerical value to string), 349
Examples, legacy Modbus
Legacy Modbus RTU, holding register addressing, 1267
Legacy Modbus RTU, MB_HOLD_REG parameter examples, 1265
Examples, legacy Modbus CP
MB_HOLD_REG parameter, 1245

Examples, legacy Modbus RTU
master program, 1270
slave program, 1272
Examples, legacy Modbus TCP
holding register addressing, 1247
MB_CLIENT coordinating multiple Modbus TCP requests, 1252
MB_CLIENT multiple requests with different Modbus TCP connections, 1251
MB_CLIENT output image write request, 1252
MB_CLIENT: multiple requests with common Modbus TCP connection,
MB_SERVER multiple Modbus TCP connections, 1249
Examples, Modbus
MB_CLIENT multiple requests with common Modbus TCP connection, 1171
MB_CLIENT multiple requests with different Modbus TCP connections, 1172
MB_SERVER multiple Modbus TCP connections, 1170
Modbus RTU master program, 1200
Modbus RTU slave program, 1203
Modbus TCP MB_CLIENT coordinating multiple requests, 1174
Modbus TCP MB_CLIENT ourput image write request, 1173
Modbus TCP, holding register addressing, 1166
Modbus TCP, MB_CLIENT connection parameters, 1157
Modbus TCP, MB_HOLD_REG parameter examples, 1163
Modbus TCP, MB_SERVER connection parameters, 1161
Examples, motion control
axis behavior, 743
Axis control with the TM Pulse module, 685
configuring a technology object motion command table, 691
CPU 1211C, CPU 1212C, CPU 1214C, and CPU 1215C pulse output speed configurations, 641
CPU 1217C pulse output speed configuration, 640
jerk limit, 713
jog behavior, 751
velocity, 747
velocity characteristics of MC homing, 712
Examples, PID
PID_3Step, configuration settings, 609
PID_Compact, configuration settings, 608
PID_Temp, configuration settings, 611
Examples, PtP communication
configuration, 1119
end message condition, 1083
Legacy PtP communication, RCV_CFG, 1210
message length within message, 1084
Receive_Config, 1098
running the terminal emulator example, 1127
start message condition, 1079
STEP 7 programming, 1125
terminal emulator, 1118, 1126
Examples, runtime string instructions
GetBlockName, 373
GetInstanceName, 369
GetInstancePath, 370
GetSymbolName, 363
GetSymbolPath, 366
Examples, USS communication
legacy USS communication errors reporting, 1233
USS communication error reporting, 1142
Examples, various
accessing array elements, 284
analog value processing, 120, 293
AT tag overlay, 133
configuration control (option handling), 161
CPU 1217C Differential input and application, 1427
CPU 1217C differential output and appplication, 1428
data log program, 515
downloading selected blocks in RUN mode, 1324
dragging and dropping between editors, 46
ENO evaluation in SCL, 203
nested CASE statements, SCL, 314
power budget calculation, 1546
recipe, 485, 492
S7-1200 IO-Link Master connection, 1480
slice of tagged data type, 132
trace and logic analyzer function, 1333
Examples, Web server
access from mobile device, 989
aliases, 1024, 1029
combining AWP declarations, 1034
enum types, 1030, 1031, 1045
fragment DBs, 1033
reading special variables, 1027
reading variables, 1024, 1045
special characters in AWP commands, 1035
STEP 7 program to check fragments, 1060
user-defined Web page, 1042, 1047
user-defined Web page to switch languages, 1053
writing special variables, 1028, 1047
writing variables, 1025, 1046
Exchanging a V3.0 CPU for a V4.2.x CPU, 1561
Execution speeds of instructions, 1357, 1370, 1383, 1397, 1413

EXIT, SCL, 318
EXP (form exponential value), 258
Expandable instructions, 44
Expanding the capabilities of the S7-1200, 31
Expansion cable, 1542
  installation, 68
  removal, 68
EXPT (exponentiate), 258
Extended block interface
  download in RUN mode, 1327

F

F_TRIG (set tag on negative signal edge), 228
Factory settings reset, 1303

Instructions
  & box (FBD AND logic operation), 222
  -( )- (normally open coil), 223
  -(/)- (normally closed coil), 223
  -(N)- (set operand on negative signal edge), 227
  -(P)- (set operand on positive signal edge), 227
  -(RESET_BF) (reset bit field), 225
  -(SET_BF) (set bit field), 225
  /= box (FBD negate assignment), 223
  -|/|- (normally closed contact), 221
  -||- (normally open contact), 221
  -|N|- (scan operand for negative signal edge), 227
  -|P|- (scan operand for positive signal edge), 227
  = box (FBD assignment), 223
  >=1 box (FBD OR logic operation), 222
  ABS (form absolute value), 255
  ACOS (form arccosine value), 258
  ACT_TINT (activate time of day interrupt), 418
  ADD (add), 250
  adding inputs or outputs to LAD or FBD instructions, 44
  AND (logic operation), 320
  AS-i distributed I/O, 374
  ASIN (form arcsine value), 258
  ATAN (form arctangent value), 258
  ATH (convert ASCII string to hexadecimal number), 351
  ATTACH (attach an OB to an interrupt event), 408
  ATTR_DB (Read data block attribute), 528
  CALCULATE, 42
  CALCULATE (calculate), 249
  calendar, 329
  CAN_DINT (cancel time-delay interrupt), 420
  CAN_TINT (cancel time of day interrupt), 417
  CASE (SCL), 313
  CEIL (generate next higher integer from floating-point number), 290
  Chars_TO_Strg (convert array of CHAR to character string), 349
  clock, 332
  columns and headers, 45, 816, 828, 836, 847, 1130, 1151, 1177, 1221, 1235, 1253
  common parameters, 891
  compare values, 244
  CONCAT (combine character strings), 355
  CONTINUE (SCL), 317
  CONV (convert value), 285
  COS (form cosine value), 258
  CountOfElements (Get number of ARRAY elements), 282
  CREATE_DB (Create data block), 520
  CTD (count down), 238
  CTRL_HSC (control high-speed counter), 570
  CTRL_HSC_EXT (Control high-speed counter (extended)), 542

CTRL_PTO (pulse train output), 474
CTRL_PWM (pulse width modulation), 473
CTU (count up), 238
CTUD (count up and down), 238
DataLogClose (close data log), 505
DataLogCreate (create data log), 496
DataLogNewFile (data log in new file), 507
DataLogOpen (open data log), 500
DataLogWrite (write data log), 501
date, 329
DB_ANY_TO_VARIANT (Convert DB_ANY to VARIANT, 295
DEC (decrement), 254
DECO (decode), 321
DELETE (delete characters in a character string), 357
DELETE_DB (Delete data block), 530
DEMUX (demultiplex), 324
Deserialize, 263
DETACH (detach an OB from an interrupt event), 408
DeviceStates (read module status of an I/O system), 455
DIS_AIRT (disable execution of higher priority interrupts and asynchronous error events), 423
DIV (divide), 250
DPNRM_DG (read diagnostic data from a DP slave), 404
DPRD_DAT (read consistent data of a DP standard slave), 396
DPWR_DAT (write consistent data of a DP standard slave), 396
drag and drop, 40
drag and drop between editors, 46
EN_AIRT (enable execution of higher priority interrupts and asynchronous error events)), 423
ENCO (encode), 321
ENDIS_PW (enable disable passwords), 302
EQ_ElemType (Compare data type of an ARRAY element for EQUAL with the data type of a tag), 247
EQ_Type (Compare data type for EQUAL with the data type of a tag), 247
EXIT (SCL), 318
EXP (form exponential value), 258
expandable instructions, 44
EXPT (exponentiate), 258
F_TRIG (set tag on negative signal edge), 228
favorites, 41
FieldRead (read field), 283
FieldWrite (write field), 283
FILL_BLK (fill block), 269
FIND (find characters in a character string), 360
FLOOR (generate next lower integer from floating-point number), 290
FOR (SCL), 314
force operation, 1319
FRAC (return fraction), 258
Gen_UsrMsg (Generate user diagnostic alarms), 424
GEO2LOG (Determine the hardware identifier based upon slot information), 532
GET (read data from a remote CPU), 965
GET_DIAG (read diagnostic information), 466
GET_ERROR (get error locally), 306
GET_ERROR_ID (get error ID locally), 307
Get_Features (get advanced features), 1113
Get_IM_Data (read the identification and maintenance data), 439
GetBlockName (Read out name of the block), 372
GetInstanceName (Read out name of block instance), 367
GetSInstancePath (Query composite global name of the block instance), 370
GetSymbolName (Read out a tag on the input parameter), 361
GetSymbolPath (Query composite global name of the input parameter assignment), 364
GOTO (SCL), 319
HTA (convert hexadecimal number to ASCII string), 351
IF-THEN (SCL), 312
IN_Range (value within range), 245
INC (increment), 254
INSERT (insert characters in a character string), 358
inserting, 40
INV (create ones complement), 321
IO2MOD (Determine the hardware identifier from an I/O address, 535
IS_ARRAY (Check for ARRAY), 249
IS_NULL (Query for EQUALS zero pointer), 248
JMP (jump if RLO = 1), 297
JMP_LIST (define jump list), 298
JMPN (jump if RLO = 0), 297
Label (jump label), 297
LED (read LED status), 438
LEFT (read the left characters of a character string), 356
legacy TCON, TDISCON, TSEND, and TRCV instructions, 848
legacy TRCV_C (receive data via Ethernet (TCP)), 829
legacy TSEND_C (send data via Ethernet (TCP)), 829

legacy USS status codes, 1232
LEN (determine the length of a character string), 354
LIMIT (set limit value), 257
LN (form natural logarithm), 258
LOG2GEO (Determine the slot from the hardware identifier), 534
LOWER_BOUND (read out ARRAY low limit), 272
MAX (get maximum), 256
MAX_LEN (maximum length of a character string), 353
MB_CLIENT, 1151
MC_ChangeDynamic (change dynamic settings for the axis), 737
MC_CommandTable, 734
MC_Halt (pause axis), 723
MC_Home (home axis), 720
MC_MoveAbsolute (position axis absolutely), 725
MC_MoveJog (move axis in jog mode), 732
MC_MoveRelative (position axis relatively), 728
MC_MoveVelocity (move axis at predefined velocity), 730
MC_Power (release/block axis), 716
MC_ReadParam (read parameters of a technology object), 741
MC_Reset (confirm error), 719
MC_WriteParam (write to parameters of a technology object), 739
MID (read the middle characters of a character string), 356
MIN (get minimum), 256
MOD (return remainder of division), 252
Modbus_Comm_Load (Configure SIPLUS I/O or port on the PtP module for Modbus RTU), 1178
Modbus_Master (Communicate using SIPLUS I/O or the PtP port as Modbus RTU master), 1182
Modbus_Slave (Communicate using SIPLUS I/O or the PtP port as Modbus RTU slave), 1190
ModuleStates (read module status information of a module), 460
monitor, 1313
monitoring status or value, 1312
motion control, 714
MOVE (move value), 260
MOVE_BLK (move block), 260
MUL (multiply), 250
MUX (multiplex), 323
N (scan operand for negative signal edge), 227
N_TRIG (scan RLO for negative signal edge), 228
N= box and N coil (set operand on negative signal edge), 227
NE_ElemType (Compare data type for UNEQUAL with the data type of a tag), 247
NE_Type (Compare data type for UNEQUAL with the data type of a tag), 247
NEG (create twos complement), 253
NORM_X (normalize), 291
NOT (invert RLO), 223
NOT_NULL (Query for UNEQUALS zero pointer), 248
NOT_OK (check invalidity), 246
OK (check validity), 246
OR (logic operation), 320
OUT_Range (value outside range), 245
P (scan operand for positive signal edge), 227
P_TRIG (scan RLO for positive signal edge), 228
P= box and P coil (set operand on positive signal edge), 227
P3964_Config (Configuring the 3964(R) protocol), 1101
PEEK and POKE variations, 200, 276
PID_Compact (universal PID controller with integrated tuning), 578
PID_Temp (universal PID controller that allows handling of temperature control), 596
Port_Config (port configuration), 1090
PROFIBUS distributed I/O, 374
PROFINET distributed I/O, 374
program control (SCL), 311
PRVREC (make data record available), 401
PUT (write data to a remote CPU), 965
QRY_CINT (query cyclic interrupt parameters), 413
QRY_DINT (query time-delay interrupt status), 420
QRY_TINT (query status of time of day interrupt), 419
R (reset output), 224
R_TRIG (set tag on positive signal edge), 228
RALRM (receive interupt), 383
RCVREC (receive data record), 399
RD_ADDR (determine the IO addresses from the hardware identifier), 537
RD_LOC_T (read local time), 332
RD_SYS_T (read time-of-day), 332
RDREC (read data record), 375
RE_TRIGR, 107
RE_TRIGR (restart cycle monitoring time), 304
READ_BIG (Read data in big little endian format), 278
READ_DBL (read from data block in load memory), 525
READ_LITTLE (Read data in little endian format), 278
Receive_Config (receive configuration), 1095

Receive_P2P (receive Point-to-Point), 1108
Receive_Reset (receiver reset), 1110
RecipeExport (recipe export), 488
RecipeImport (recipe import), 490
REPEAT (SCL), 316
REPLACE (replace characters in a character string), 359
reset output, 224
RESET_BF (reset bit field), 225
RET (return), 301
RETURN (SCL), 319
RIGHT (read the right characters of a character string), 356
ROL (rotate left) and ROR (rotate right), 327
ROUND (round numerical value), 289
RS (reset/set flip-flop), 225
RT (reset timer), 230
RTM (runtime meters), 337
RUNTIME (Measure program runtime), 309
S (set output), 224
S_CONV (convert character string), 340
S_MOV (move chracter string), 339
SCALE_X (scale), 291
scaling analog values, 43
SCL conversion instructions, 286
SEL (select), 323
Send_Config (send configuration), 1093
Send_P2P (send Point-to-Point data), 1103
Serialize, 266
set output, 224
SET_BF (set bit field), 225
SET_CINT (set cyclic interrupt parameters), 411
Set_Features (set advanced features), 1114
SET_TIMEZONE (set time zone), 336
SET_TINTL (set date and time of day interrupt), 415
SGN_GET (get RS232 signals), 1110
SHL (shift left) and SHR (shift right), 326
Signal_Set (set RS232 signals), 1112
SIN (form sine value), 258
SQR (form square), 258
SQRT (form square root), 258
SR (set/reset flip-flop), 225
SRT_DINT (start time-delay interrupt), 420
status, 1313
STP (exit program), 305
Strg_TO_Chars (convert character string to array of CHAR), 349
STRG_VAL (convert character string to numerical value), 340
SUB (subtract), 250
SWAP (swap bytes), 271
SWITCH (jump distributor), 299
T_ADD (add times), 330
T_COMBINE (combine times), 331
T_CONFIG (configure interface), 880
T_CONV (convert times and extract), 329
T_DIAG, 859
T_DIFF (time difference), 331
T_RESET, 857
T_SUB (subtract times), 330
TAN (form tangent value), 258
TCON, 837
TDISCON, 837
time, 329
timer, 230
TM_MAIL (send email), 1287
TOF (off-delay timer), 230
TON (on-delay timer), 230
TONR (on-delay retentive timer), 230
TP (pulse timer), 230
TRCV, 837
TRCV_C, 817, 900
TRUNC (truncate numerical value), 289
TSEND, 837
TSEND_C, 817, 898
TURCV (receive data via Ethernet (UDP)), 874
TUSEND (send data via Ethernet (UDP)), 874
UFILL_BLK (fill block uninterruptible), 269
UMOVE_BLK (move block uninterruptible), 260
UPPER_BOUND (read out ARRAY high limit), 274
USS status codes, 1141
USS_Drive_Control (Swap data with drive), 1135
USS_Port_Scan (Edit communication via USS network), 1134
USS_Read_Param (readout parameters from the drive), 1138
USS_Write_Param (change parameters in the drive), 1139
VAL_STRG (convert numerical value to character string), 340
VARIANT_TO_DB_ANY (Convert VARIANT to DB_ANY), 294
VariantGet (Read VARIANT tag value), 280
VariantPut (Write VARIANT tag value), 281
versions of
instructions, 45, 816, 828, 836, 847, 1130, 1151, 1177, 1221, 1235, 1253
WHILE (SCL), 315
WR_LOC_T (set local time), 332
WR_SYS_T (set time-of-day), 332
WRIT_DBL (write to data block in load memory), 525
WRITE_BIG (Write data in big endian format), 278

WRITE_LITTLE (Write data in little endian format), 278
WRREC (write data record), 375
WWW (synchronizing user-defined Web pages), 1038
x box (FBD XOR logic operation), 222
XOR (logic operation), 320
Instructions, legacy
MB_CLIENT (communicate via PROFINET as Modbus TCP client), 1236
MB_COMM_LOAD (configure port on the PtP module for Modbus RTU), 1254
MB_MASTER (communicate via the PtP port as Modbus master), 1257
MB_SERVER (communicate via PROFINET as Modbus TCP server), 1243
MB_SLAVE (communicate via the PtP port as Modbus slave), 1263
PORT_CFG (configure communication parameters dynamically), 1204
RCV_CFG (configure serial receive parameters dynamically), 1208
RCV_PTP (enable receive messages), 1215
RCV_RST (delete receive buffer), 1216
SEND_CFG (configure serial transmission parameters dynamically), 1206
SEND_PTP (transmit send buffer data), 1212
SGN_GET (Query RS232 signals), 1217
SGN_SET (set RS-232 signals), 1218
USS_DRV (Swap data with drive), 1226
USS_PORT (Edit communication via USS network), 1225
USS_RPM (readout parameters from the drive), 1229
USS_WPM (change parameters in the drive), 1230
Inter-character gap, 1082
Interrupts
ATTACH (attach an OB to an interrupt event), 408
CAN_DINT (cancel time-delay interrupt), 420
DETACH (detach an OB from an interrupt event, 408
interrupt latency, 103
overview, 92
QRY_DINT (query time-delay interrupt status), 420
SRT_DINT (start time-delay interrupt), 420

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Preface

This document is part of the **SIMOTION P documentation package**.

This documentation describes the SIMOTION P320-4 hardware platform which can be delivered in the SIMOTION P320-4 E and SIMOTION P320-4 S hardware versions:

- SIMOTION P320-4 E with the Windows Embedded Standard 7 32-bit operating system and real-time expansion for SIMOTION.
  Successor to SIMOTION P320-3.
- SIMOTION P320-4 E with the Windows 7 Ultimate 32-bit operating system and real-time expansion for SIMOTION.
  Successor to SIMOTION P350-3.

References

The following documents contain the descriptions for the SIMOTION P hardware platform:

- SIMOTION P320-4 E / P320-4 S, Manual, Edition 11/2016
- SIMOTION P320-4 E / P320-4 S, Commissioning and Hardware Installation Manual, Edition 11/2016

Validity range

This manual applies to the SIMOTION P320-4 E and SIMOTION P320-4 S devices as of product level SIMOTION V4.5.

Standards

The SIMOTION system was developed in accordance with ISO 9001 quality guidelines.

Chapters in this documentation

The following sections describe the purpose and the use of this documentation:

- Safety instructions
  Contains fundamental safety instructions for SIMOTION and specific safety instructions for SIMOTION P320-4.
- Description
  System overview and product description for SIMOTION P320-4. The communication versions are also described.
- Use planning
  Points to note in advance: upon delivery, the permitted installation positions, environmental and ambient conditions and electromagnetic compatibility.

- Interfaces
  Description of the interfaces and operator control and display elements for SIMOTION P320-4.
- Installation/mounting
  An overview of the installation of the SIMOTION P320-4 taking into account the mounting positions.
- Connecting
  This section provides general information and important notes that you must observe when connecting the SIMOTION P320-4.
- Troubleshooting/FAQs
  List of possible errors and their remedies.
- Technical specifications
  This section contains an overview of the technical data, which is listed in detail for the individual components.
- Dimension drawings
  In this section you can find dimension drawings and dimensions of the SIMOTION P320-4.
- Spare parts
  You can find information about the spare parts for the SIMOTION P320-4 here.
- Appendix
  In addition to the safety information, the annexes also contain information about the standards, approvals and EGB guideline.
- Index
  Alphabetical directory for locating information.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION V4.5:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P

- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

https://support.industry.siemens.com/cs/ww/en/view/109480700

Additional information

Click the following link to find information on the following topics:

- Documentation overview
- Additional links to download documents
- Using documentation online (find and search manuals/information)

https://support.industry.siemens.com/cs/ww/en/view/109479653

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

https://support.industry.siemens.com/My/ww/en/documentation

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

http://www.siemens.com/sitrain

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

https://support.industry.siemens.com/cs/de/en/ps/14505/faq

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

https://support.industry.siemens.com/cs/ww/en/sc/2090

Disposal and recycling of the device

The disposal of the products described in this manual must be performed in compliance with the valid national regulations.

To a great extent, the products can be recycled owing to their low pollutant content. To recycle and dispose of your old device in an environmentally friendly way, please contact a waste disposal service certified for electronic waste.

If you have any further questions about disposal and recycling, please contact your local Siemens contact person. Contact details can be found in our contacts database on the Internet at: http://www.automation.siemens.com/partner/index.asp

Table of contents

Preface **3**

1 Safety instructions **11**

1.1 Fundamental safety instructions 11
1.1.1 General safety instructions 11
1.1.2 Safety instructions for electromagnetic fields (EMF) 14
1.1.3 Handling electrostatic sensitive devices (ESD) 14
1.1.4 Industrial security 15
1.1.5 Danger to life due to software manipulation when using removable storage media 16
1.1.6 Residual risks of power drive systems 16

1.2 Specific safety instructions for the SIMOTION P320-4 17
1.2.1 General safety instructions for the SIMOTION P320-4 17
1.2.2 Notes on use 20

2 Industrial security **21**

2.1 Security concept for SIMOTION P320-4 21
2.1.1 Security 21

2.2 Why is industrial security so important? 23
2.2.1 Trends in the IT sector 24
2.2.2 Possible corporate security holes 24

2.3 General security measures 25
2.3.1 Overview 25
2.3.2 Plant security 27
2.3.2.1 Physical protection of critical production areas 27
2.3.3 Network security 28
2.3.3.1 Network segmentation 28
2.3.4 System integrity 31
2.3.4.1 System hardening 31
2.3.4.2 Patch management 32

2.4 Product-specific measures 33
2.4.1 Virus scanners, Windows security patches, SIMOTION P 33
2.4.2 Changing the Windows user password 34
2.4.3 Changing the AutoLogin 38
2.4.4 Deactivating the remote desktop connection 45

3 Description **49**

3.1 System overview 49

3.2 SIMOTION P320-4 product description 50
3.2.1 SIMOTION P320-4 overview 50
3.2.2 Features 51
3.2.3 SIMOTION P320-4 (hardware) structure 53
3.2.4 Interfaces and operating elements 54
3.2.5 SIMOTION P Runtime (software) structure 54
3.2.6 Components 55

3.3 HMI and SIMOTION SCOUT....57
3.3.1 HMI and SIMOTION SCOUT Overview....57
3.3.2 Local HMI or ES on SIMOTION P320-4....58
3.3.2.1 Setting up a network bridge - MAC bridge miniport....59
3.3.3 HMI or ES via PROFINET....70
3.3.4 HMI or ES via Ethernet....71
3.3.5 HMI or ES via IsoPROFIBUS (optional)....73

9.5 Power requirements of the components....126
9.6 Integrated DC power supply....127
9.7 Technical data for the SITOP smart 24 V/10 A....127
9.8 Typical power consumption....129
10 Dimension drawings....131
10.1 Overview of the dimensional drawings....131
10.2 Device dimension drawing for standard rail mounting....131
10.3 Device dimension drawing for vertical mounting....133
10.4 Dimension drawing of device with one expansion card....135
11 Spare parts....137
11.1 Available spare parts for SIMOTION P320-4....137
A Standards and approvals....139
A.1 General rules....139
B ESD Guideline....141
B.1 ESD definition....141
B.2 Electrostatic charging of individuals....141
B.3 Basic measures for protection against discharge of static electricity....142
Index....143

Safety instructions

1

1.1 Fundamental safety instructions

1.1.1 General safety instructions

⚠ DANGER

Danger to life due to live parts and other energy sources

Death or serious injury can result when live parts are touched.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, six steps apply when establishing safety:

1. Prepare for shutdown and notify all those who will be affected by the procedure.
2. Disconnect the machine from the supply.
   - Switch off the machine.
   - Wait until the discharge time specified on the warning labels has elapsed.
   - Check that it really is in a no-voltage condition, from phase conductor to phase conductor and phase conductor to protective conductor.
   - Check whether the existing auxiliary supply circuits are de-energized.
   - Ensure that the motors cannot move.
3. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water.
4. Isolate or neutralize all hazardous energy sources by closing switches, grounding or short-circuiting or closing valves, for example.
5. Secure the energy sources against switching on again.
6. Ensure that the correct machine is completely interlocked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Touching live components can result in death or severe injury.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Danger to life from touching live parts on damaged devices

Improper handling of devices can result in damage.

For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Observe the limit values specified in the technical specifications during transport, storage, and operation.
- Do not use damaged devices.

⚠ WARNING

Danger to life through electric shock due to unconnected cable shields

Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the cores of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Danger to life due to electric shock when not grounded

For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Danger to life due to fire spreading if housing is inadequate

Fire and smoke development can cause severe personal injury or material damage.

- Install devices without a protective housing in a metal control cabinet (or protect the device by another equivalent measure) in such a way that contact with fire inside and outside the device is prevented.
- Ensure that smoke can only escape via controlled and monitored paths.

⚠ WARNING

Danger to life from unexpected movement of machines when using mobile wireless devices or mobile phones

Using mobile radios or mobile phones with a transmit power > 1 W closer than approx. 2 m to the components may cause the devices to malfunction, influence the functional safety of machines therefore putting people at risk or causing material damage.

- Switch off wireless devices or mobile phones in the immediate vicinity of the components.

⚠ WARNING

Danger to life due to fire if overheating occurs because of insufficient ventilation clearances

Inadequate ventilation clearances can cause overheating of components followed by fire and smoke development. This can cause death or serious injury. This can also result in increased downtime and reduced service life for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

⚠ WARNING

Danger of an accident occurring due to missing or illegible warning labels

Missing or illegible warning labels can result in accidents involving death or serious injury.

- Check that the warning labels are complete based on the documentation.
- Attach any missing warning labels to the components, in the national language if necessary.
- Replace illegible warning labels.

⚠ WARNING

Danger to life when safety functions are inactive

Safety functions that are inactive or that have not been adjusted accordingly can cause operational faults on machines that could lead to serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

Note

Important safety notices for safety functions

If you want to use safety functions, you must observe the safety notices in the safety manuals.

1.1.2 Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

1.1.3 Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

1.1.4 Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit http://www.siemens.com/industrialsecurity.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under http://www.siemens.com/industrialsecurity..

⚠ WARNING

Danger as a result of unsafe operating states resulting from software manipulation

Software manipulation (e.g. by viruses, Trojan horses, malware, worms) can cause unsafe operating states to develop in your installation which can lead to death, severe injuries and/or material damage.

- Keep the software up to date.
  Information and newsletters can be found at:
  http://support.automation.siemens.com
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial security concept for the installation or machine.
  For more detailed information, go to:
  http://www.siemens.com/industrialsecurity
- Make sure that you include all installed products into the integrated industrial security concept.

1.1.5 Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

1.1.6 Residual risks of power drive systems

When performing the risk assessment for a machine or plant in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or plant constructor must take into account the following residual risks associated with the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance and repairs caused by, for example:
   - Hardware and/or software errors in the sensors, control system, actuators, and cables and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices / mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-rays, ionizing radiation and cosmic radiation
2. Unusually high temperatures, including open flames, as well as emissions of light, noise, particles, gases, etc., can occur inside and outside the components under fault conditions caused by, for example:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage

3. Hazardous shock voltages caused by, for example:
   - Component failure
   - Influence during electrostatic charging
   - Induction of voltages in moving motors
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

1.2 Specific safety instructions for the SIMOTION P320-4

1.2.1 General safety instructions for the SIMOTION P320-4

⚠ WARNING

Life-threatening voltages are present with an open control cabinet

When you install the device in a control cabinet, some areas or components in the open control cabinet may be carrying life-threatening voltages.

If you touch these areas or components, you may be killed by electric shock.

Switch off the power supply to the cabinet before opening it.

System expansions

NOTICE

Damage through system expansions

Device and system expansions may be faulty and can affect the entire machine or plant.

The installation of expansions can damage the device, machine or plant.

Device and system expansions may violate safety rules and regulations regarding radio interference suppression.

If you install or exchange system expansions and damage your device, the warranty becomes void.

Note the following for system expansions:

- Only install system expansion devices designed for this device. Contact your technical support team or where you purchased your PC to find out which system expansion devices may safely be installed.
- Observe the information on electromagnetic compatibility (Page 139).

NOTICE

"Open Type" UL508

Note that the device is classified as "Open Type" for use in the area of Industrial Control Equipment (UL508). Installation of the device in an enclosure according to UL508 is conditional for approval or operation according to UL508.

Battery and rechargeable battery

⚠ WARNING

Risk of explosion and release of harmful substances

Improper handling of lithium batteries can result in an explosion of the batteries.

Explosion of the batteries and the released pollutants can cause severe physical injury. Worn batteries jeopardize the function of the device.

Note the following when handling lithium batteries:

- Replace used batteries in good time, see the section "Replacing the backup battery" in the Commissioning and Hardware Installation Manual.
- Replace the lithium battery only with an identical battery or types recommended by the manufacturer (Article No.: A5E30314053).
- Do not throw lithium batteries into fire, do not solder on the cell body, do not recharge, do not open, do not short-circuit, do not reverse polarity, do not heat above 100°C and protect from direct sunlight, moisture and condensation.

High frequency radiation

NOTICE

Unintentional operating situations

High frequency radiation, e g. from a cellular phone, interferes with device functions and can result in malfunctioning of the device.

Persons are injured and the plant is damaged.

Avoid high-frequency radiation:

- Remove radiation sources from the environment of the device.
- Switch off radiating devices.
- Reduce the radio output of radiating devices.
- Observe the information on electromagnetic compatibility (Page 139).

ESD Guideline

Electrostatic sensitive devices can be labeled with an appropriate symbol.

NOTICE

Electrostatic sensitive devices (ESD)

When you touch electrostatic sensitive components, you can destroy them through voltages that are far below the human perception threshold.

If you work with components that can be destroyed by electrostatic discharge, observe the ESD Guideline.

Further information

You can find more detailed information about the **EGB Guideline** in Annex B in the section with the same name.

1.2.2 Notes on use

⚠ WARNING

Hazards on an unprotected machine or plant

According to the results of a risk analysis, hazards can occur on an unprotected machine. The hazards can result in personal injury.

According to the risk analysis, the risk of personal injury can be avoided with the following measures:

- Additional protective devices on the machine or plant. With this, especially the programming, configuration and wiring of the inserted I/O modules have to be executed, in accordance with the necessary risk analysis identified safety performance (SIL, PL or Cat.).
- The correct use of the device has to be verified with a function test on the system. This test can detect programming, configuration and wiring errors.
- Documentation of the test results that you can enter in the relevant safety records when required.

NOTICE

Ambient conditions

Ambient conditions for which the device is not suitable can cause faults or damage the device.

Note the following:

- Operate the device only in closed rooms. Failure to comply nullifies the warranty.
- Operate the device only in accordance with the ambient conditions specified in the technical specifications.
- Protect the device against dust, moisture and heat.
- Do not expose the device to direct sunlight or other strong sources of light.
- Without additional measures, such as a supply of clean air, the device may not be used in locations with harsh operating conditions caused by acidic vapors or gases.
- Observe the permissible mounting positions of the device.
- Do not obstruct the venting slots of the device.

Note

Use in an industrial environment without additional protective measures

This device was designed for use in a normal industrial environment according to IEC 60721-3-3.

Industrial security

2

2.1 Security concept for SIMOTION P320-4

2.1.1 Security

Note

Observe the general security information in this documentation for Industrial security (Page 15).

Regular change of the Windows password

Note

For security reasons, the Windows password should be changed regularly.

It is essential that the AutoLogin is also adapted for this purpose.

You can find instructions in the following sections:

- Changing the Windows user password (Page 34)
- AutoLogin for SIMOTION P (Page 38).

Unlocking Windows

Note

Windows locked

Windows may be accidentally locked, e.g. through shortcut key Windows + L.

If you do not know the password for the SIMOTION P320-4, please contact the Siemens Industry Online Support (https://support.industry.siemens.com/cs/?lc=en-DE).

Windows firewall

Note

Windows firewall

To allows the Windows IP to be accessed externally, this must be set as an exception in the Windows firewall **File and Printer Sharing**. Otherwise, there is only limited access to Windows from outside.

Security and networks

Note

You will find information on the security of networks in Section General security measures (Page 25).

Remote desktop connection

Note that for the SIMOTION P320-4 with Headless operation, you require a user name and password for a remote desktop connection. Per default, the remote desktop connection is already set up.

Note

Deactivating the remote desktop connection

If you do **not** use the remote desktop connection, it must be deactivated for security reasons.

See Section Deactivating the remote desktop connection (Page 45)

SIMOTION IT

Note

Security concept

Note the security concept of HTTP/S, FTP and Telnet access on the Web server when working with SIMOTION IT.

You will find information in the SIMOTION IT Diagnostics and Configuration Diagnostics Manual or the SIMOTION online help in Section Security concept.

Note

User administration

Note the information on the user administration when working with SIMOTION IT.

You will find information in the SIMOTION IT Diagnostics and Configuration Diagnostics Manual or the SIMOTION online help in Section User administration.

Information on industrial security

The following sections are taken from the Motion Control Industrial Security Configuration Manual:

- Why is industrial security so important? (Page 23)
- General security measures (Page 25)
- Product-specific measures (virus scanners) (Page 33)

You can view the entire document in the Industry Online Support (https://support.industry.siemens.com/cs/ww/en/view/108862708).

2.2 Why is industrial security so important?

The topic of data security and access protection (security) is becoming more and more important in industrial environments. The progressive networking of entire industrial plants, the vertical integration and networking of the individual levels of a company, and new technologies, such as remote maintenance and remote access, are leading to increased requirements for protecting industrial plants.

The threats are diverse and the consequences far-reaching.

Possible threats:

- Espionage of data, recipes, etc.
- Sabotage of production plants
- System stoppage, e.g. due to virus infection and malware
- Manipulation of data or application software
- Unauthorized use of system functions

Possible effects of a security incident

- Loss of intellectual property
- Loss of production or reduced product quality
- Company image and economic damage

- Catastrophic environmental influences
- Danger to persons and machines

2.2.1 Trends in the IT sector

Overview

There are many new trends which affect industrial security:

- Cloud computing in general
  The number of network connections across the world is constantly increasing. This enables innovations such as cloud computing and the applications that go hand in hand with it. In conjunction with cloud computing, there has been a massive increase in the number of mobile devices, such as mobile phones and tablet PCs.
- Wireless technology
  On the other hand, the increasing use of mobile devices has only become possible thanks to the ubiquitous availability of mobile networks. Wireless LAN is also becoming increasingly available.
- Smart Grid
  Networking is not only limited to data networks, it also influences our energy infrastructure.
- Worldwide remote access to plants, machines and mobile applications
- The "Internet of things"
  Millions of electronic devices are becoming network-capable and are communicating via the Internet, such as onboard computers in cars, which send warranty information to dealers, or water meter sensors that transmit water consumption data to municipal water suppliers via radio.

However, in order for everything from cloud computing to sensors to work without service disruptions, you need reliable network infrastructures that are well protected against attacks from malware and hackers.

2.2.2 Possible corporate security holes

Possible security holes or weak points

The security chain of a company is only as strong as its weakest link. Security holes can exist at numerous points. The following list gives only a few examples:

- Employees
- Production plants
- Network infrastructure
- Data centers
- PC workstations

- Laptops
- Tablet PCs
- Printers
- Smartphones
- Portable storage media
- Guidelines and regulations

For this reason, a holistic approach is required to deal with the issue of security. Coordinated guidelines and regulations are required that cover all areas: Devices, systems, processes and employees.

2.3 General security measures

2.3.1 Overview

In the following section you will learn about the general security measures you can take in order to protect your system from threats. All of the measures are recommended.

Additional specific security measures for SINUMERIK, SIMOTION and SINAMICS products can be found in Section Product-specific security measures (Page 33).

Basically, the measures should be coordinated with one another and correspond to the ring-shaped principle of the "Defense in Depth" strategy. The measures are structured according to the "onion" principle and each measure forms an additional protective layer around the core: the production plant.

Figure 2-1 Defense in depth strategy

- **Plant security**
  Plant security represents the outermost protective ring. Plant security includes comprehensive physical security measures, e.g. entry checks, which should be closely coordinated with protective measures for IT security.
- **Network security**
  The measures, grouped under the keyword "Network security", form the core of the protective measures. This refers to the segmentation of the plant network with limited and secure communication between subnetworks ("secure islands") and the interface check with the use of firewalls.
- **System integrity**
  "System integrity" represents the combination two major measures. PC-based systems and the control level must be protected against attacks. Steps include the following measures:
  - User authentication for machine or plant operators with individual authorization levels
  - Integrated access protection mechanisms in the automation components to prevent unauthorized changes via the engineering system or during maintenance
  - The use of antivirus and whitelisting software to protect PC systems against malware
  - Maintenance and update processes to keep the automation systems up-to-date (e.g. patch management, firmware updates, etc.)

2.3.2 Plant security

2.3.2.1 Physical protection of critical production areas

Unauthorized persons may be able to enter the production site/building and damage or alter production equipment as a result of gaps in a company's physical security. Confidential information can also be lost. This can be prevented if both the company's site and the production areas are protected accordingly.

Company security

The company's physical security can be ensured via the following measures:

- Closed off and monitored company premises
- Entry control, keys / card readers and/or security personnel
- Escorting of external personnel by company employees

Physical production security

The physical security of a production location can also be ensured via the following measures:

- Separate access control for production areas.
- Installation of critical components in securely lockable cabinets / switching rooms including monitoring and alarm signaling options
- Prohibited production areas with restricted access rights
- Configuration of the radio field to restrict the WLAN range so that it is not available outside the defined areas (e.g. factory building).
- Guidelines that prevent the use of third-party data storage media (e.g. USB sticks) and IT devices (e.g. notebooks) classified as insecure on the control.

Further information

Further information on integrated security solutions can be found on the Surveillance page (http://www.buildingtechnologies.siemens.com/bt/global/en/security-solution/Pages/security-solution.aspx).

2.3.3 Network security

2.3.3.1 Network segmentation

Separation between production and office networks

One important protective measure for your control is the strict separation of the production networks and the other company networks. This separation creates protection zones for your production networks.

Note

The products – drives, controllers, commissioning tools (e.g. STARTER or Startdrive) – described in this manual must only be operated in protection zones.

Separation by means of a firewall system

In the simplest scenario, separation is achieved by means of an individual firewall system which controls and regulates communication between networks.

Separation via a DMZ network

In the more secure version, the coupling is established via a separate DMZ network. In this case, direct communication between the production network and the company network is completely prevented by firewalls and only takes place indirectly via servers in the DMZ network.

Note

The production networks should also be divided into separate automation cells in order to protect critical communication mechanisms.

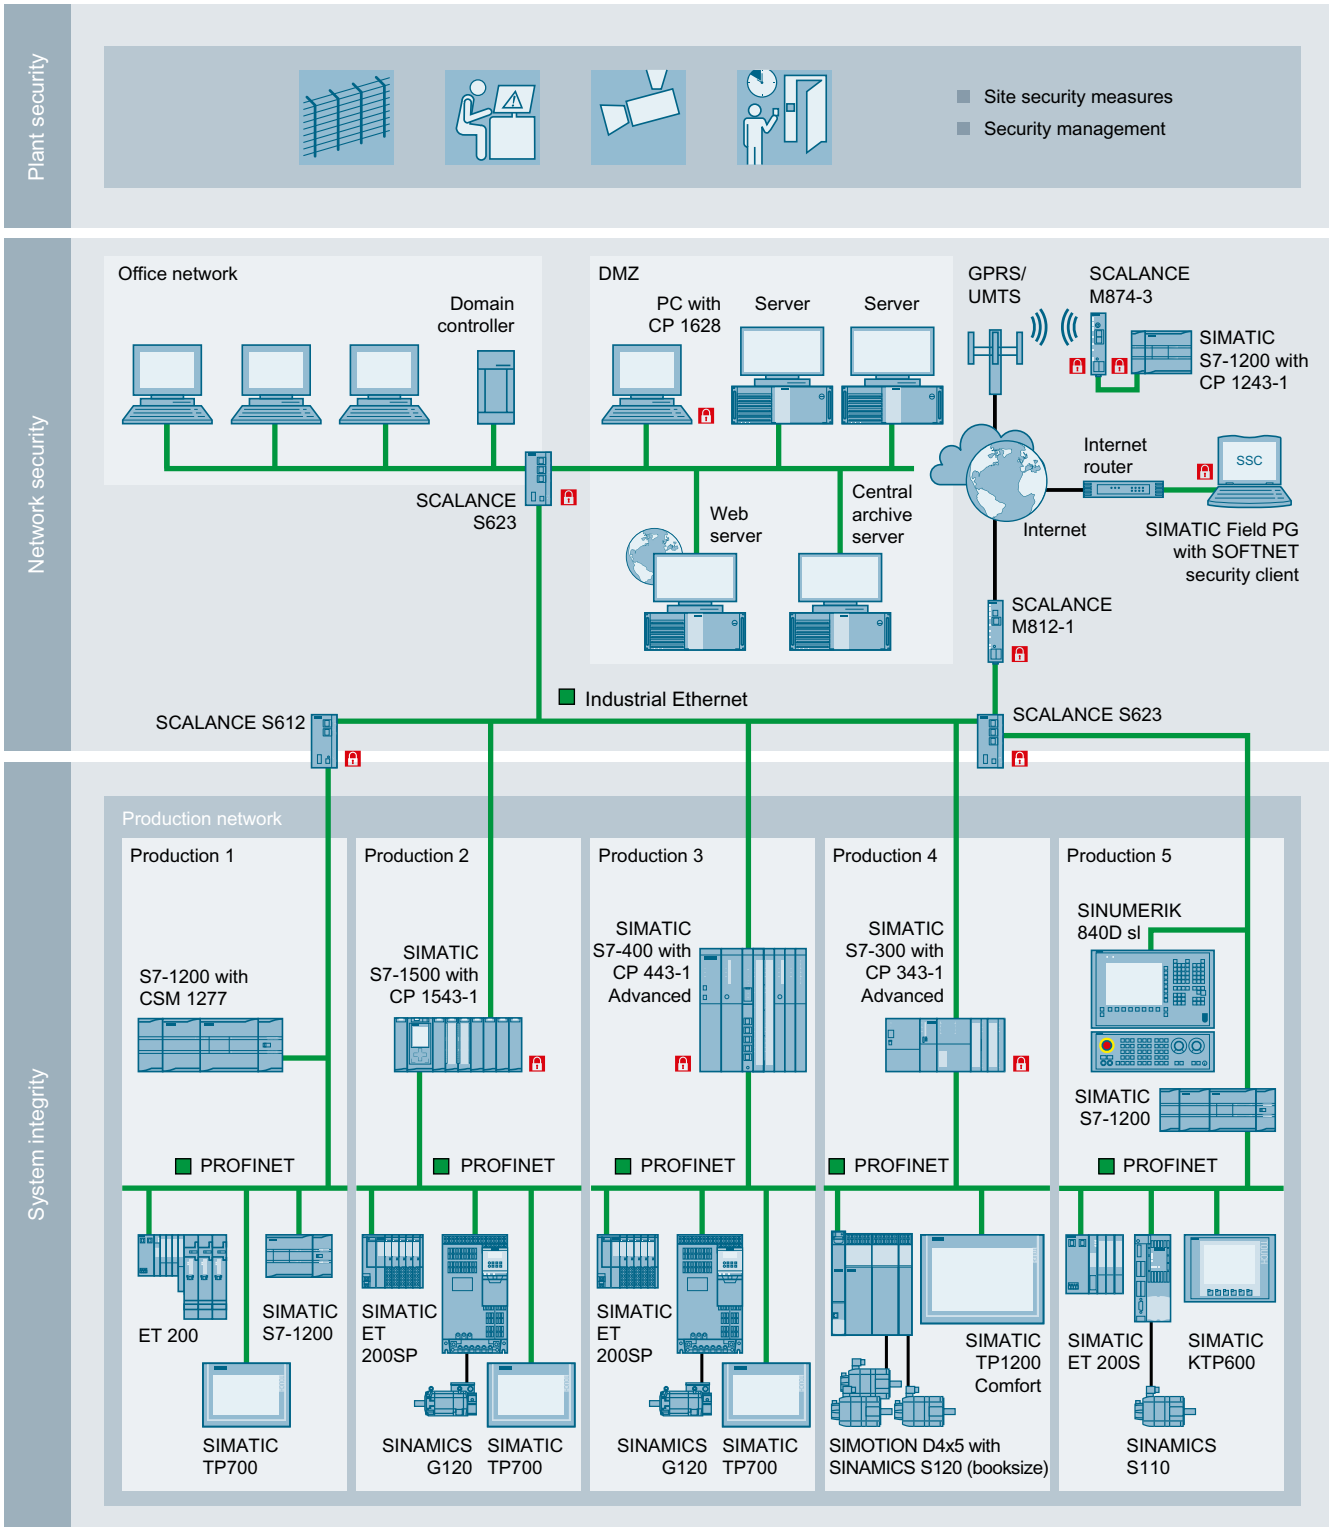
General security measures

Observe the general security measures even within protection zones, for example:

- Virus scanners (Page 31)
- Reduction of attack points (Page 31)

Network segmentation with SCALANCE S

Siemens provides SCALANCE S security modules to meet network protection and network segmentation requirements.



SCALANCE S security modules

SCALANCE S security modules with Security Integrated provide:

- Stateful inspection firewall
  In order to implement user-specific control and logging, firewall rules can also be specified that only apply to certain users.
- VPN via IPsec (data encryption and authentication)
  This establishes a secure tunnel between authenticated users whose data cannot be intercepted or manipulated. The most important aspect is the protection against external access via the Internet.
- NAT/NATP (address translation)
- Router functionality (PPPoE, DDNS) for broadband Internet access (DSL, cable)
- S623 with additional VPN port (DMZ) enables the secure connection of an additional network for service and remote maintenance purposes. S623 also permits the secure, redundant connection of subordinate networks by means of routers and firewall redundancy.

Principle

This application example shows cell segmentation by several SCALANCE S modules, each of which is upstream of the automation cell. The data traffic to and from the devices within automation cells can be filtered and controlled with the SCALANCE S firewall. If required, the traffic between the cells can be encrypted and authenticated. Secure channels and client access from the PCs to the cells can be established via SOFTNET Security Client, VPN client software for PCs.

2.3.4 System integrity

2.3.4.1 System hardening

Reduction of attack points

Network services and ports

Activated services represent a risk. To minimize the risk, only the necessary services for all of the automation components should be activated. Ensure that all activated services are taken into account (especially web servers, FTP, remote maintenance, etc.) in the security concept.

A description of the ports used can be found in the Manuals and Function Manuals of the respective products.

User accounts

Any active user account allows access to the system is thus a potential risk. Therefore, take the following security measures:

- Reduction of configured/activated user accounts to the actually needed minimum
- Use of secure access data for existing accounts
- Regular checks, especially of the locally configured user accounts
- Regular change of passwords

Passwords

NOTICE
Changing default passwords The misuse of passwords can also represent a considerable security risk. We recommend that default passwords be changed during the commissioning and changed at regularly defined intervals as required.

Virus scanner

The use of a virus scanner must not impact the production operations of a plant. As the last consequence, this will lead to even a virus-infected computer not being permitted to immediately shut down if this would cause the control of the production process to be lost.

In order to be used on industrial control components, a virus scanner should therefore meet the following requirements:

Virus scanner requirements

- If a local firewall that has been adapted to the production operations is used, it must be possible to install the virus scanner without its own firewall.
- The virus scan clients can be divided into (product- and task-specific) groups and configured separately.
- It must be possible to deactivate the automatic distribution of the virus signatures and other updates.
- It must be possible to carry out the distribution of the virus signatures and updates manually and in groups.
- It must be possible to conduct a file scan and system scan manually and in groups.
- For the virus detection scenario, a message can be configured without a file action such as "Delete", "Clean", etc. being automatically carried out.
- It must be possible to log all of the messages on the virus scan server.
- On a virus scan client, it must be possible to suppress the local message window because it could obscure important messages from the production process.

Note

Installation of software

The installation of software is often a process which represents a serious and complicated change to the respective system. The storage location of the files to be installed must always be free of viruses (e.g. a file server with its own virus scanner or DVD checked for viruses).

2.3.4.2 Patch management

Microsoft security updates

The **WSUS** (Windows Server Update Service) system functionality provided by Microsoft is available for current Windows systems. WSUS supports administrators by providing Microsoft updates in large local networks. WSUS automatically downloads update packages from the Internet (Microsoft Update) and offers them to the Windows clients for installation.

The fully automatic update process ensures that Microsoft security updates are always available on Siemens clients.

2.4 Product-specific measures

2.4.1 Virus scanners, Windows security patches, SIMOTION P

General information on virus scanners

Once an industrial PC system is connected to the Internet, either directly or via an internal company network, there is a danger that it can become infected with a virus. However, malicious software is not only able to reach the system via the Intranet/Internet, but also, for example, via a removable storage device (such as a USB memory stick) attached to the system for backing up data.

SIMOTION P320-4 virus scanners

A virus scanner that runs on Microsoft Windows, as used in office or home computers, has a deep impact on a system's processes. There are, for example, processes such as real-time scans or regular system scans. Such interventions can cause performance issues for the system, and as a result, for the SIMOTION Runtime software. Although the SIMOTION Runtime software runs in a real-time environment, it still depends on the available system resources.

Note

Because of the resulting performance impairments, the installation and use of a standard virus scanner on a SIMOTION P320-4 during system runtime does not make sense and is not permitted.

Using a virus scanner

As a standard virus scanner cannot be used for SIMOTION P320-4, an alternative procedure is followed. The virus scanner is installed to a separately bootable Windows PE operating system. It is started, for example, from a CD or a USB storage device and then performs a virus scan.

Note

FAQ Service & Support portal

More information on using a virus scanner on a SIMOTION P320-4 can be found in the FAQ "How can a virus scanner be used on a SIMOTION P320-4?" (https://support.industry.siemens.com/cs/ww/en/view/59381507) which is available as a download from the Service & Support portal.

Windows security patches

A brief test is performed when a new SIMOTION version is released. During this brief test, a check is performed to establish whether the installation of the security update has affected any basic functions.

2.4.2 Changing the Windows user password

Permitting the Windows password to be changed

Before the Windows password can be changed, it must be permitted for the user.

If the following procedure is not observed, an error message is issued and the Windows password cannot be changed.

Note the following procedure:

1. Select the entry point **Control Panel** > **All Control Panel Items** > **Administrative Tools** > **Computer Management**.
   Double-click **Computer Management**.

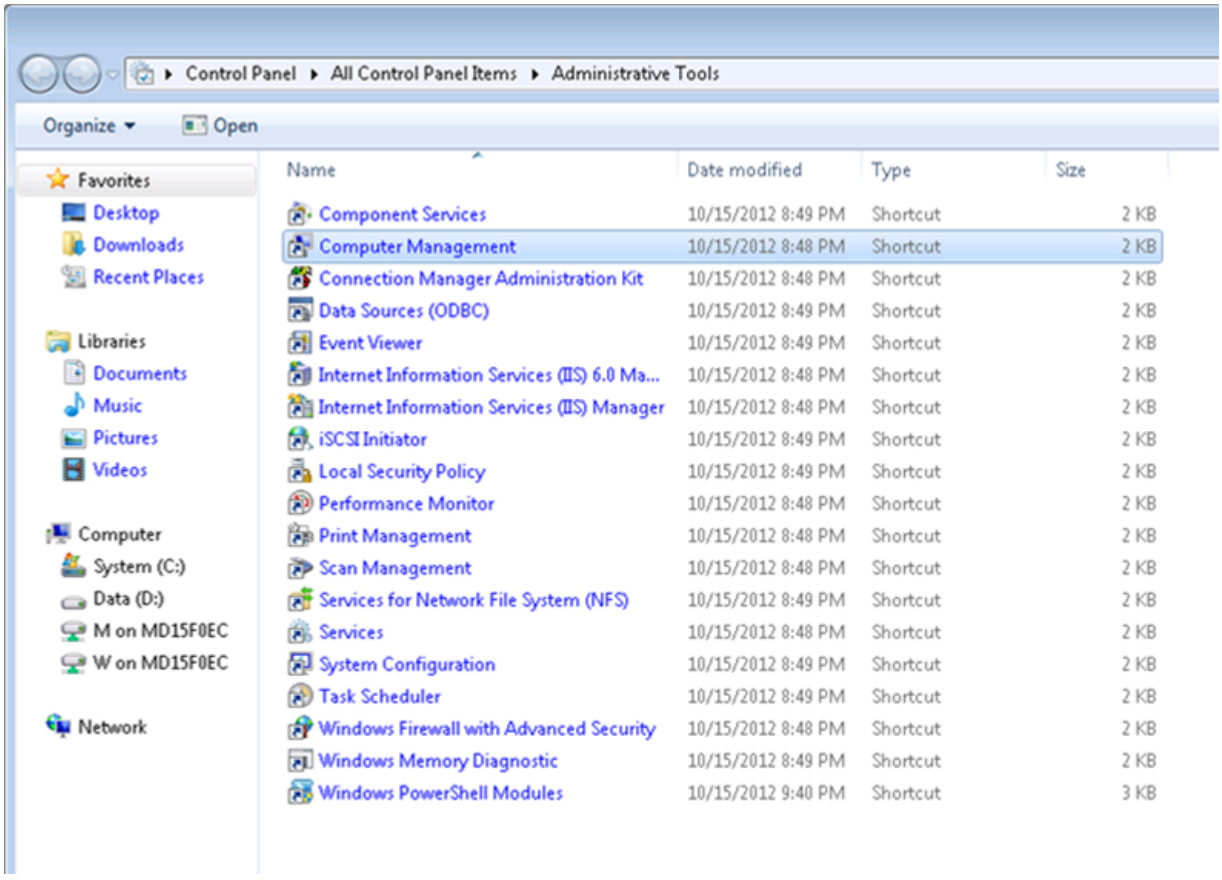

Figure 2-2 Homepage:

2. The **Users** folder is displayed at **Local Users and Groups** in the **Computer Management** window.
   Click the **Users** folder. The available user groups are displayed.

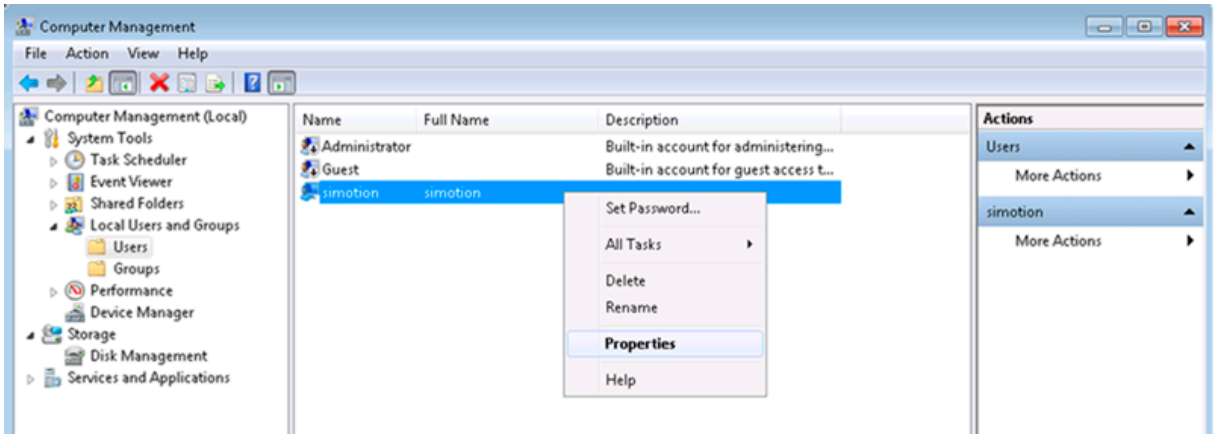

Figure 2-3 Computer management

3. With the selection of **Users simotion**, you can display the properties via **Properties**.
4. Deactivate the "**User cannot change password**" checkbox in the **General** tab on the **simotion Properties** dialog box.
   This checkbox must be deactivated for the user to change the Windows password.

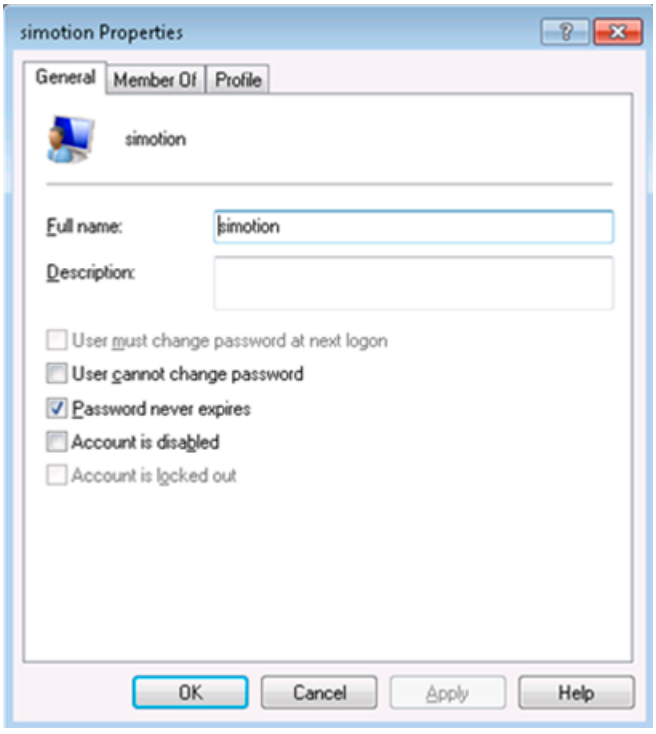

Figure 2-4 SIMOTION properties

Changing the Windows password

You can find general information on the Windows password on the website at Microsoft - Changing des Windows-password (http://windows.microsoft.com/en-us/windows/change-windows-password#change-windows-password=windows-7).

To change the Windows password, proceed as follows:

1. Press Ctrl+Alt+Del. The following Windows window opens.

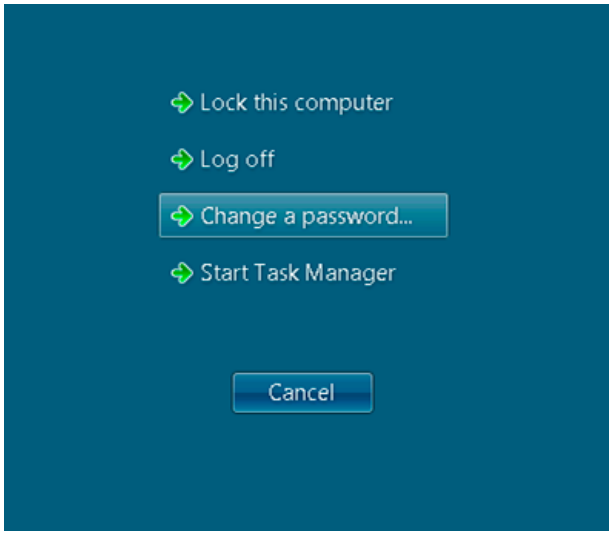

Figure 2-5 Changing the Windows password

2. After you have confirmed **Change a password...** , the Windows window to change the Windows password opens.
   First enter your current password and then the new Windows password. You must enter the new Windows password a second time for confirmation.

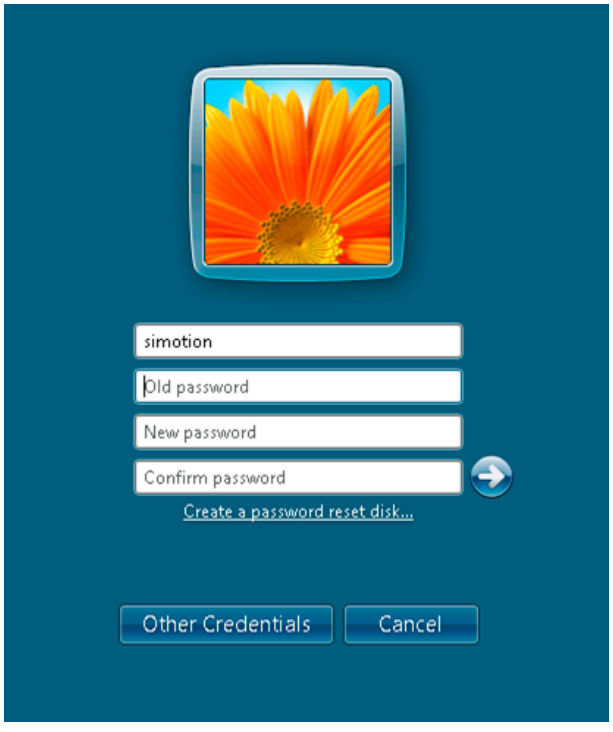

Figure 2-6 Entering the new Windows password

3. The password was changed successfully.

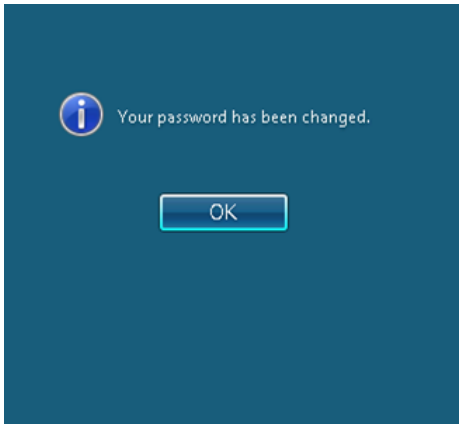

Figure 2-7 Confirmation of change

4. In the event of an error when the "User cannot change password" checkbox is activated, the following error message is displayed.
The Windows password has not been changed.

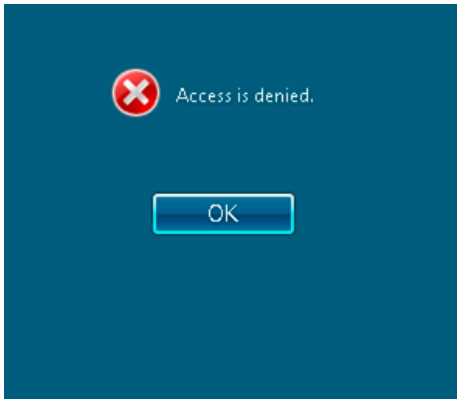

Figure 2-8 Error message when changing the Windows password has not been permitted.

2.4.3 Changing the AutoLogin

The password for the AutoLogin must be changed when the user has changed the Windows password.

The Windows user password is changed in the normal way, e.g. "Change Password" screen.
See also Section Changing the Windows user password (Page 34).

Automatically Log On

SIMOTION P320-4 is preset so that the user does not have to enter the user name and the password to log on.

Preparation for changing the AutoLogin

In order that an AutoLogin still functions after changing the Windows password, the password for the AutoLogin must be changed.

The required procedure is shown in the following so that the change of the AutoLogin for SIMOTION P320-4 can be prepared:

1. Open the **Computer Management** window via **Control Panel** > **All Control Panel Items** > **Administrative Tools** .

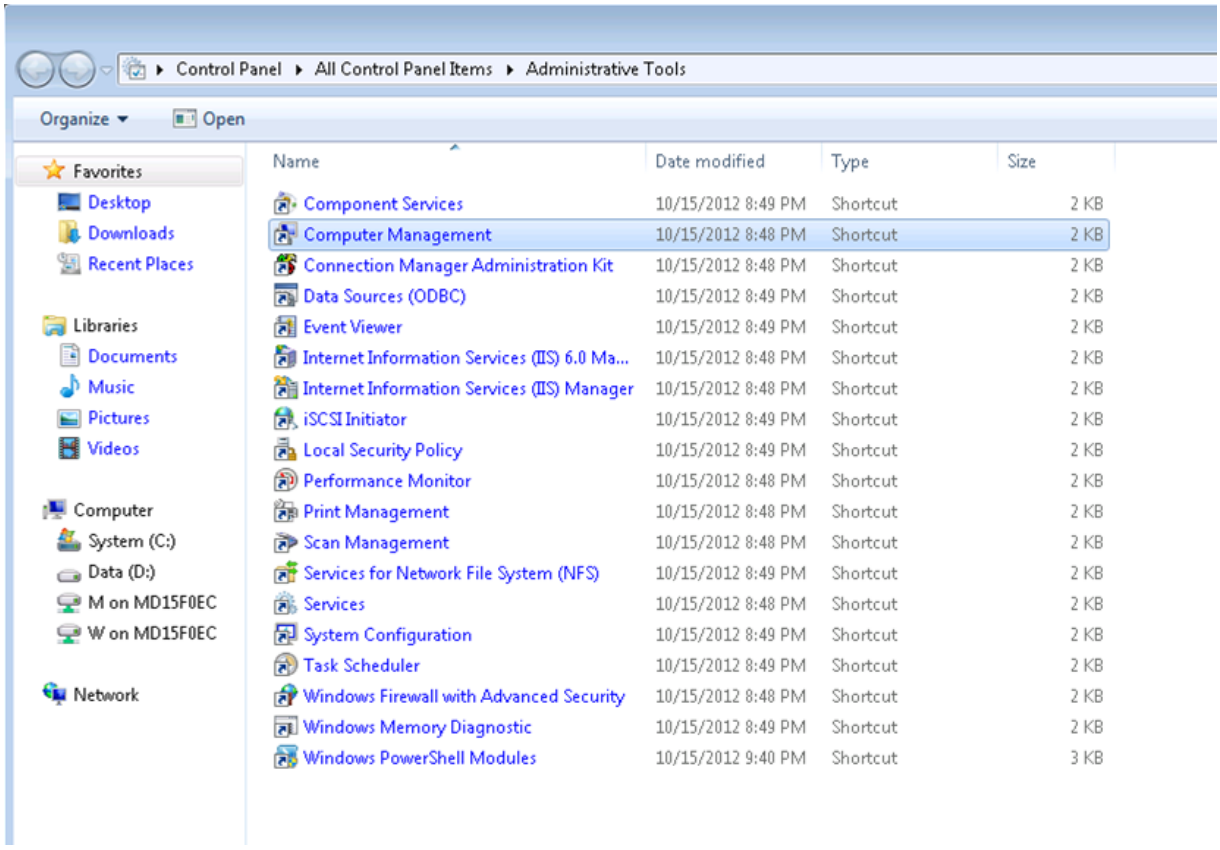

Figure 2-9 Computer Management entry point

2. The **Users** folder is displayed at **Local Users and Groups** in the **Computer Management** window.
   Click the **Users** folder. The available user groups are displayed.

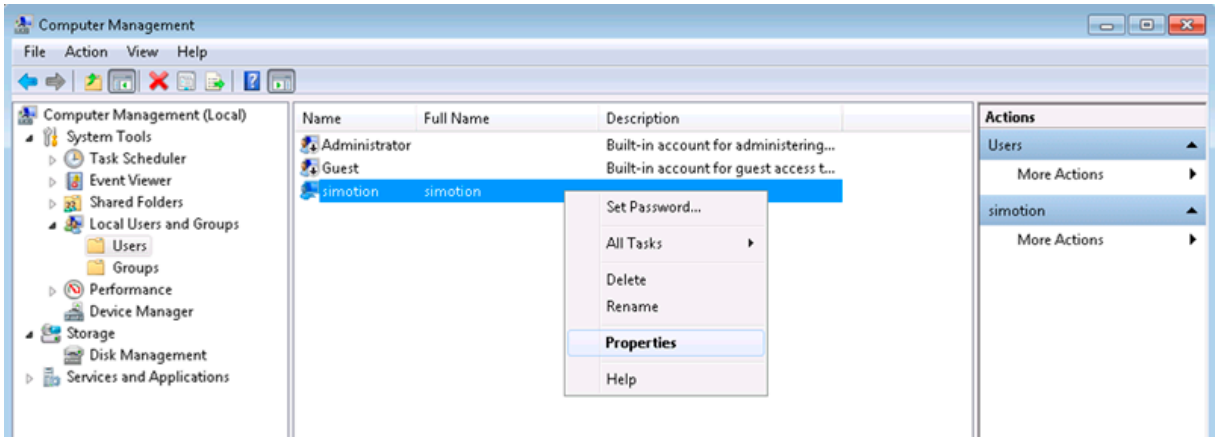

Figure 2-10 Computer Management - Users

3. With the selection of **Users> simotion**, you can display the properties via **Properties**.
4. Deactivate the **User cannot change password** checkbox in the **simotion Properties** dialog box.

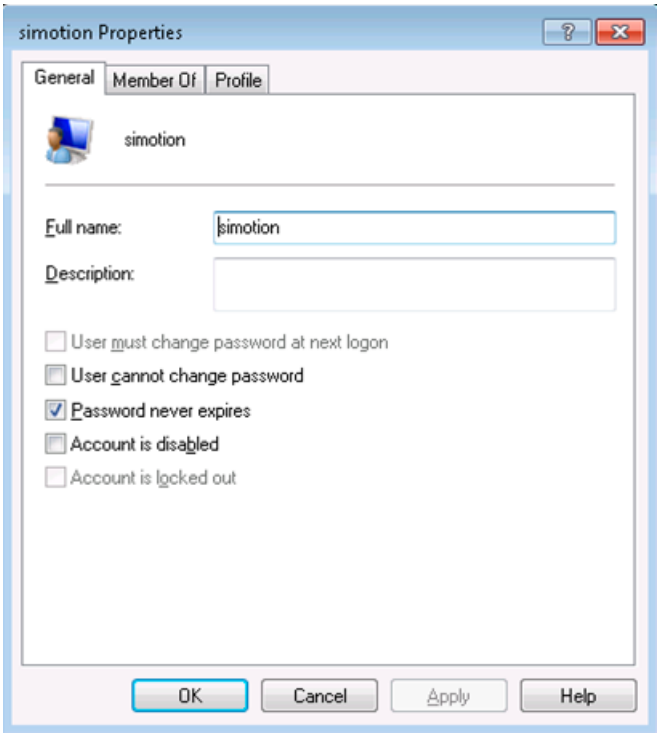

Figure 2-11 simotion Properties - General dialog box

5. Confirm with **OK.**

Changing the password for AutoLogin

To change the password for the AutoLogin, proceed as follows:

1. Open the search via **Windows-Start** and enter: **netplwiz**

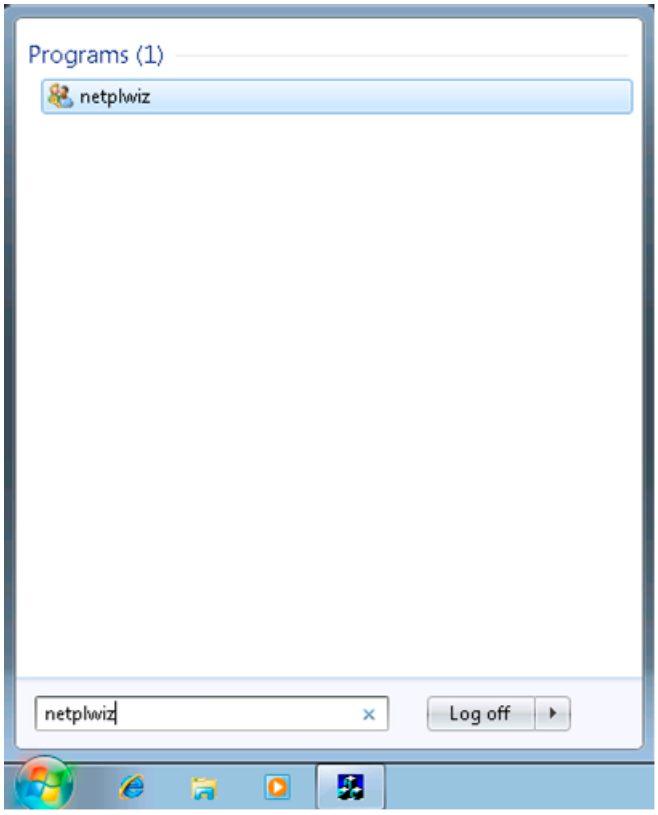

Figure 2-12 Programs netplwiz

2. The following **User Accounts** dialog box opens.

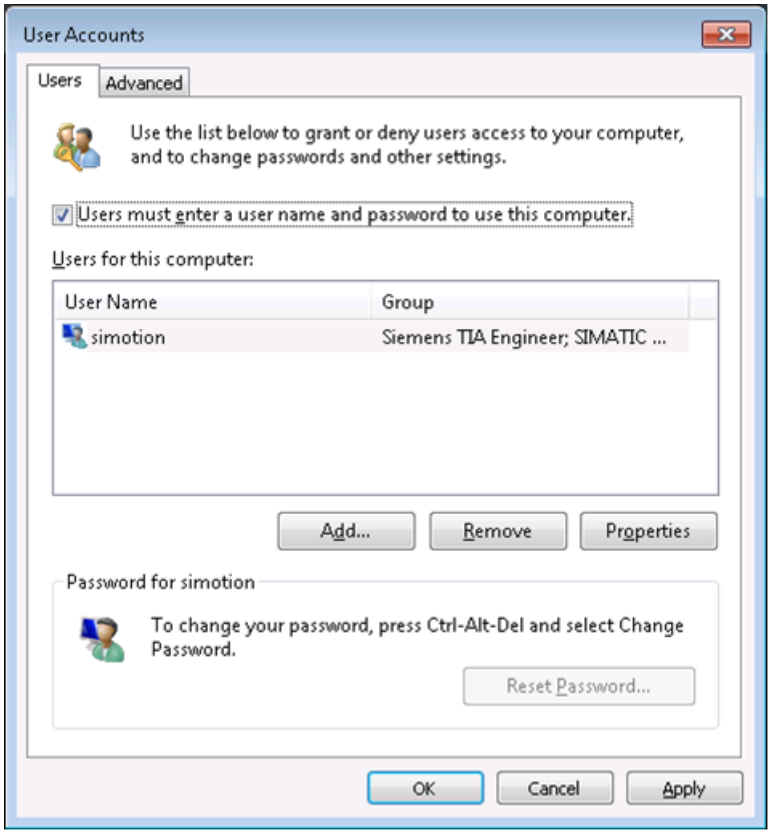

Figure 2-13 User Accounts

3. In the **Users** tab, activate the **Users must enter a user name and password to use this computer** checkbox.
   The **Apply** button is now active. Deactivate the checkbox and accept the changes now with the **OK** or **Apply** button.
   This is necessary so that the **Automatically Log On** dialog box is subsequently displayed.

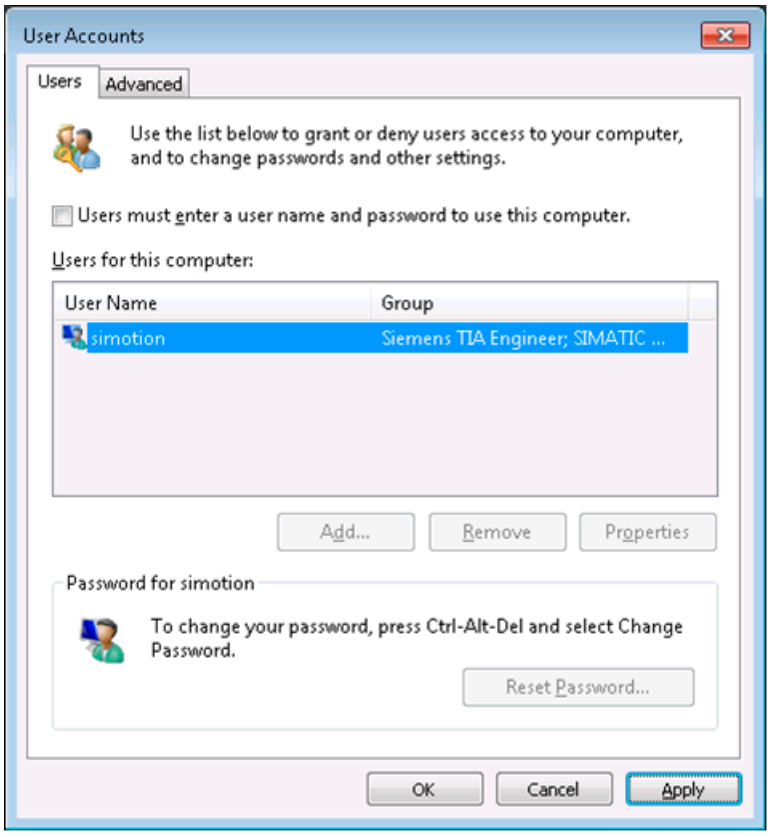

Figure 2-14 User accounts

4. Enter your changed Windows user password in the **Automatically Log On** dialog box and confirm it by entering it a second time.

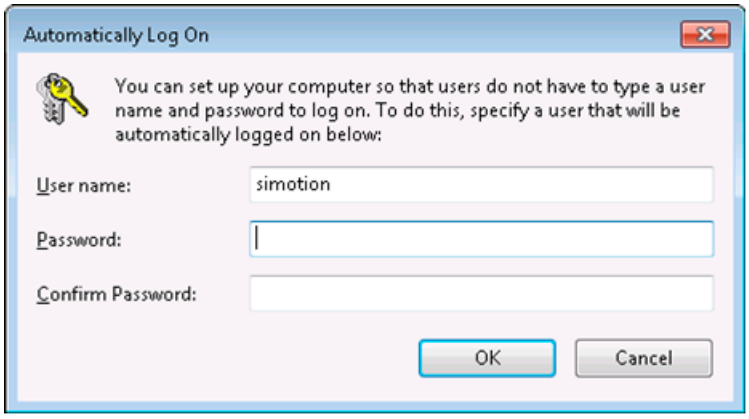

Figure 2-15 Automatically Log On dialog box

5. Confirm the password with **OK**.

2.4.4 Deactivating the remote desktop connection

Deactivating the remote desktop connection

NOTICE
Deactivating the remote desktop connection
To ensure that the remote desktop connection is not used, it must be explicitly deactivated.

Procedure for deactivating the remote desktop connection

1. Using the Control Panel, select **System** > **Remote settings**.

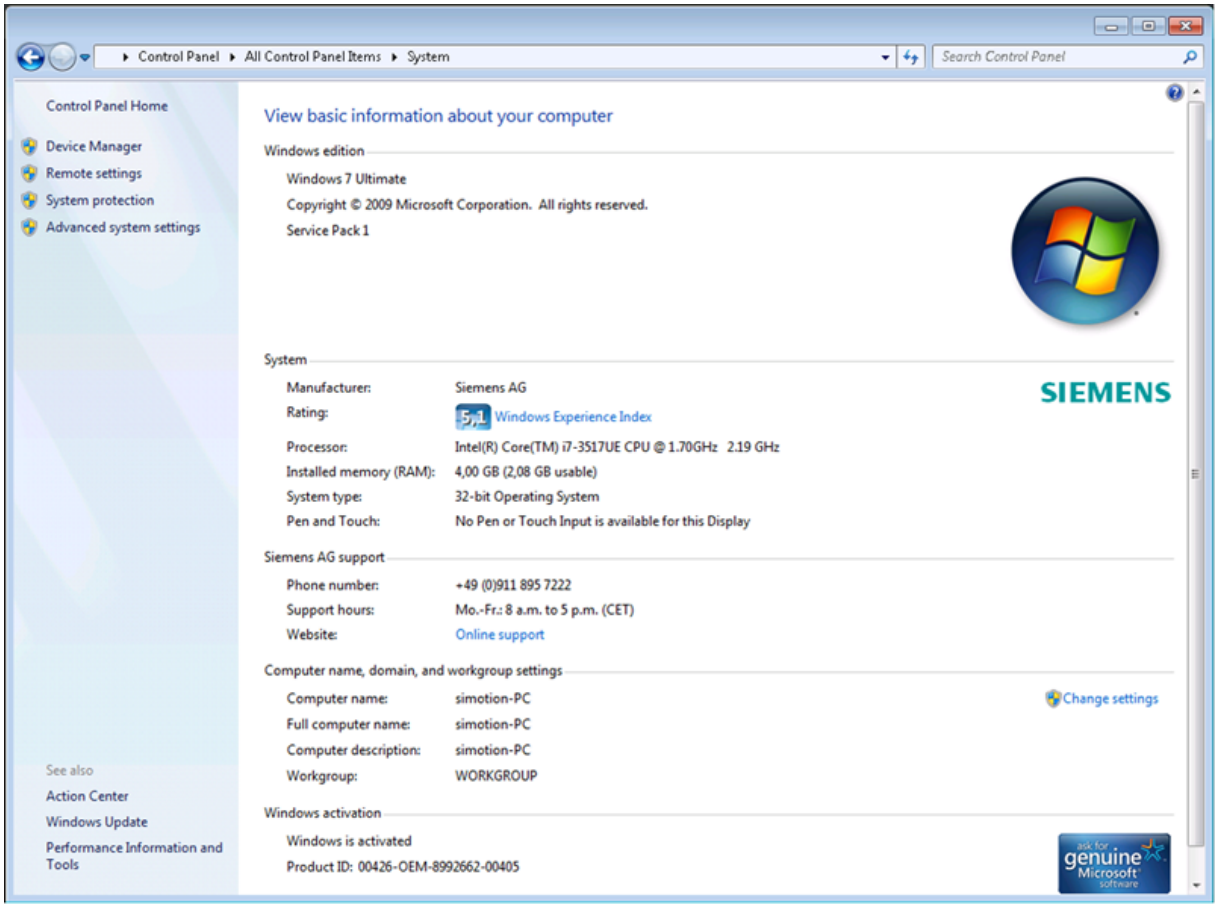

Figure 2-16 Remote settings

2. Select the **Remote** tab in the **System Properties** dialog box.

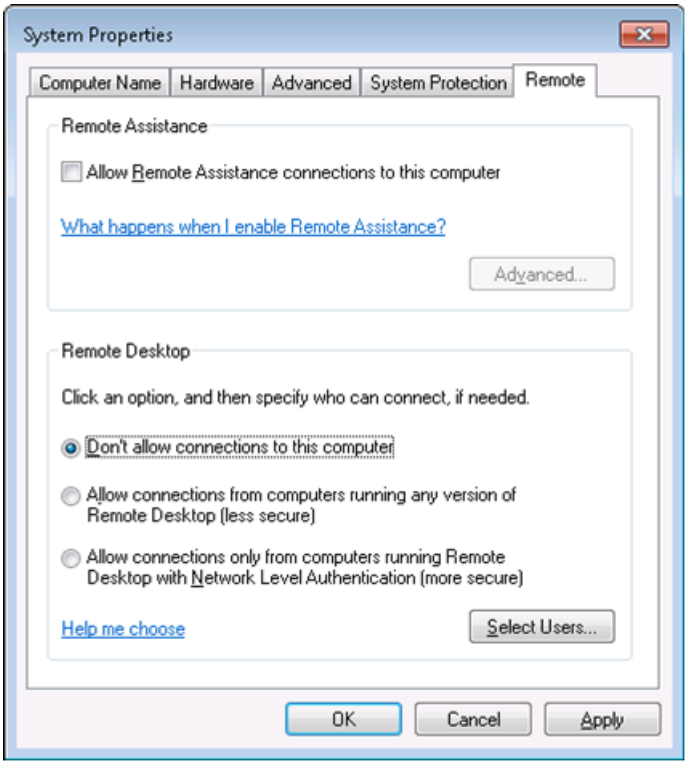

Figure 2-17 System Properties dialog box

3. Select the **Don't allow connections to this computer** option at **Remote Desktop**.
4. Confirm with **OK**.

Any remote desktop access is deactivated with this operation.

Description 3

3.1 System overview

Overview

SIMOTION P is a PC-based, open Motion Control System from SIMOTION.
Control, motion control, and HMI functions are executed together with standard PC applications on the SIMOTION P hardware platform. SIMOTION P combines the compatibility of the Windows operating system with real-time capability of SIMOTION P Runtime.

The fully independent SIMOTION P Runtime runs in parallel to Windows on SIMOTION P. This real-time expansion makes it possible to implement demanding motion control applications with high performance requirements on platforms of the SIMOTION P range. The hardware consists of a computing unit with innovative Intel technology, which is ready for operation at the time of delivery.

The drives and I/O devices are connected either via PROFINET onboard or IsoPROFIBUS board (optional).

The SIMATIC Flat Panel IFP1500, IFP1900 and IFP2200 can be used for the operation of the SIMOTION P320-4 hardware platform in a distributed configuration.

SIMOTION P320-4 versions

The SIMOTION P320-4 can control various I/O systems and HMI components via PROFINET onboard or the optional IsoPROFIBUS board.
If required, a USB DVD drive can be connected, for example.

The following versions of the SIMOTION P320-4 are available:

- SIMOTION P320-4 E
  with the Windows Embedded Standard 7 32-bit operating system and real-time expansion for SIMOTION.
- SIMOTION P320-4 S
  with the Windows 7 Ultimate 32-bit operating system and real-time expansion for SIMOTION.

Application

The SIMOTION P320-4 applications are directed at machines that require a high level of integration of PLC, motion control and technology functions on account of the increasing use of servo drives:

- Packaging machines
- Plastic and rubber processing machines
- Presses, wire-drawing machines
- Textile machines

- Printing machines
- Machines for processing wood, glass, ceramics, and stone
- Production lines in the renewable energy sector, e.g. solar technology, wind power installations

3.2 SIMOTION P320-4 product description

3.2.1 SIMOTION P320-4 overview

The SIMOTION P320-4 provides high-level industrial performance. It features:

- Compact design
- Maintenance-free operation
- High degree of ruggedness
- Long-term availability

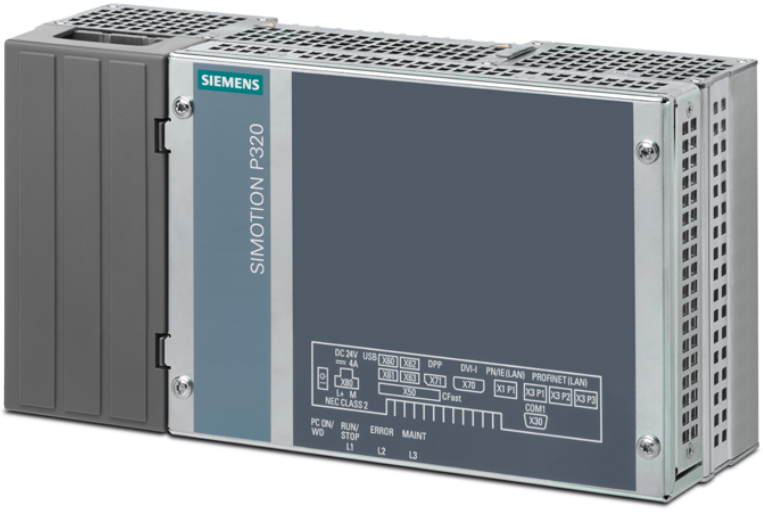

Figure 3-1 SIMOTION P320-4 view

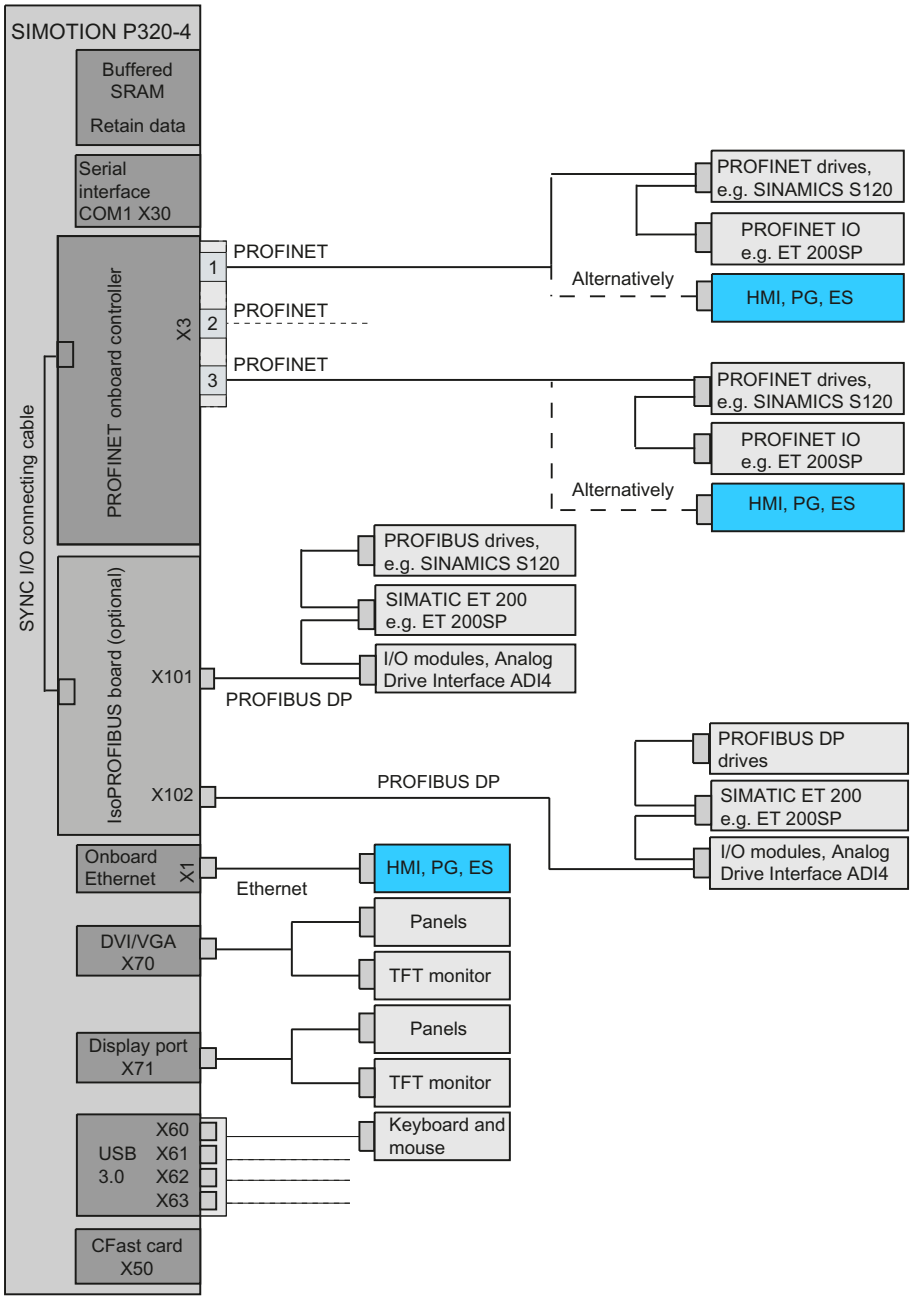
Figure 3-2 SIMOTION P320-4 (open perspective) with plugged-in optional IsoPROFIBUS board

3.2.2 Features



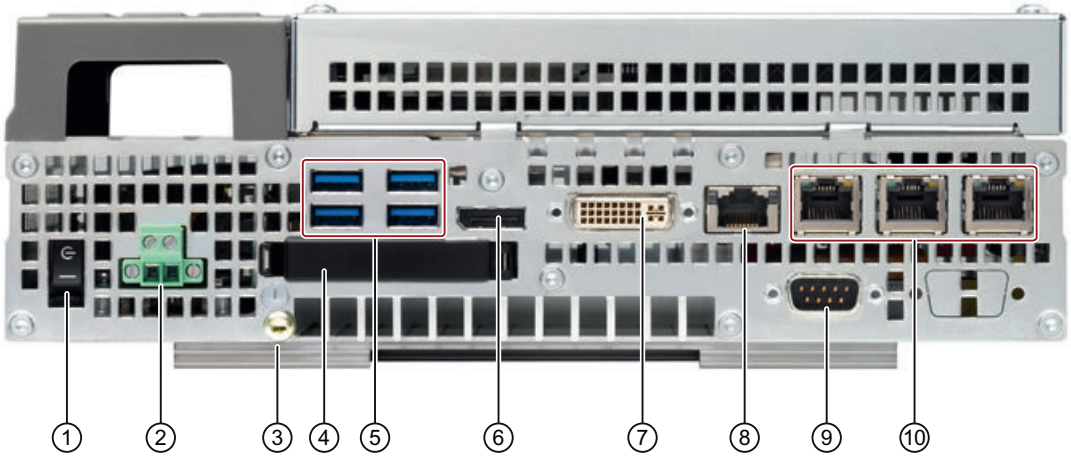
Basic data	
Installation	• Standard rail mounting • Vertical mounting
Processor	
P320-4 E **P320-4 S**	Intel Core i3-3217UE, 2 x 1.6 GHz, 3 MB cache Intel Core i7-3517UE, 2 x 1.7 GHz, 4 MB cache
Main memory	4 GB DDR3 RAM
Optional IsoPROFIBUS board (PROFIBUS DP)	2 x SUB-D socket with configurable baud rates (9.6 Kbit/s - 12 Mbps)
Graphics	• Integrated Intel HD2000 or HD4000 • DVI resolution of 640 × 480 pixels up to 1920 × 1200 pixels • Display port resolution max. 1920 × 1200 pixels • Graphics memory is occupied in the main memory (dynamic UMA)
Power supply	24 VDC (-20%/+20%) max. 4 A
Operating conditions	Operation without fan
Drives and storage media	
CFast card or SSD (Solid State Disk)	Depending on the hardware version of the SIMOTION P320-4

Basic data	
P320-4 E	**2 x CFast card** Internal interface: CFast External interface: CFast
P320-4 S	**SSD (Solid State Disk)** Internal interface: SSD **CFast card** External interface: CFast
USB stick	External, can be connected via USB interface
Interfaces	
Serial	COM (RS 232)
Graphics	DVI-I: Suitable for use as DVI or VGA DPP++: Display port, DVI via DPP-to-DVI adapter
USB	4 × USB 3.0, simultaneous operation of high current, backward compatible with USB 2.0/1.1
Ethernet	1 × RJ45 (10/100/1000 Mbps)
PROFINET I/O	3 × RJ45 (100 Mbps)
Keyboard, mouse	Can be connected via USB interface

Software	
Operating systems	
P320-4 E	Windows Embedded Standard 7 32-bit
P320-4 S	Windows 7 Ultimate 32-bit

3.2.3 SIMOTION P320-4 (hardware) structure

The following figure shows the integration of the SIMOTION P320-4 with integrated PROFINET onboard and optional IsoPROFIBUS board in a target system.



HMI Human Machine Interface
PG Programming device
ES Engineering system

Figure 3-3 SIMOTION P320-4 system overview

3.2.4 Interfaces and operating elements

SIMOTION P320-4

①	On/off switch	Position **OFF** is the delivery state. The on/off switch does not isolate the device from the power supply.
②	24 V DC	Power supply connection
③	Protective conductor	Protective conductor terminal
④	Memory card slot	Cover for the CFast card
⑤	4 × USB 3.0	USB 3.0 high current, backward compatible with USB 2.0/1.1
⑥	Display port	Display port connection for digital monitor
⑦	DVI-I	DVI connector for CRT or LCD monitor with DVI interface
⑧	Ethernet	RJ45 Ethernet connection for 10/100/1000 Mbps
⑨	COM1	Serial interface
⑩	3 × PROFINET	PROFINET ports with three RJ45 sockets

3.2.5 SIMOTION P Runtime (software) structure

SIMOTION P Runtime contains the SIMOTION P Kernel which performs the motion control and interface control.

A SIMOTION project is planned, configured, assigned parameters, commissioned and programmed via the SIMOTION SCOUT engineering system (ES).

The user data can be stored on the data media of the SIMOTION P320-4 .

Siemens WinCC flexible software can be used to visualize operational sequences or to operate the machine. Third-party systems can be linked via the OPC interface.

SIMOTION P Runtime

With the SIMOTION P320-4, the PLC and motion control functionality (starting from position controller upwards) is located centrally in a strictly deterministic task outside the Windows operating system.

Its main field of application is centralized motion control and control tasks requiring close coordination between multiple axes and/or input/output modules.

Functionality ranges from simple positioning to high-performance synchronous operation.

SIMOTION SCOUT

The SIMOTION SCOUT engineering system can be installed on the SIMOTION P320-4 S or connected via the interfaces integrated in SIMOTION P320-4 .

SIMOTION SCOUT TIA

As of version V4.5, the SIMOTION SCOUT TIA engineering system no longer supports the Windows 7 32-bit operating system and therefore cannot be installed.

HMI software

HMI/Runtime software can be operated on the same PC, e.g. the Siemens WinCC flexible software. Other software packages can be linked by means of the OPC interface.

The **HMI software** is used as the general term in the following.

Internal communication

A locally installed HMI can use the local communication to access the following:

- Variables in SIMOTION RT
- Drives on PROFINET IO or PROFIBUS DP
- Other SIMOTION devices on PROFINET IO or PROFIBUS DP

Scope of delivery

The system software supplied with the SIMOTION P320-4 is either already installed on the SIMOTION P320-4 storage medium or is ready to be installed:

- SIMOTION P Kernel
- SIMOTION IT
- SIMOTION IT VM Virtuell Machine (subject to license)

3.2.6 Components

The most important components of the SIMOTION P320-4 and their functions are listed below.

Distributed I/O systems (PROFINET)

Table 3-1 Components for distributed I/O

Component	Function
SIMATIC ET 200M	Modular I/O system for cabinet installation and high channel densities.
SIMATIC ET 200S	Finely modular I/O system for cabinet installation including motor starters, safety technology, and individual grouping of the load groups.
SIMATIC ET 200SP	Finely scalable I/O system for cabinet installation; SIMATIC ET 200SP features a single-cable and multi-cable connection with push-in terminals, compact dimensions, high performance, and low part variety.
SIMATIC ET 200MP	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-1500 packaging system. SIMATIC ET 200MP permits the shortest bus cycle times and fastest response time even with large volumes of data.
SIMATIC ET 200eco	I/O system with IP67 degree of protection for machine-related, cabinet-free applications, featuring a flexible and fast connection system in ECOFAST or M12.
SIMATIC ET 200pro	Modular I/O system with IP65/67 degree of protection for machine-related, cabinet-free applications, including motor starters.

Note

Note that not all modules of the above-mentioned I/Os or I/O systems have been released for SIMOTION.

There may also be system-dependent functional differences with regard to the use on SIMOTION and on SIMATIC.
For example, special process-control functions (e.g. HART modules, etc.) are not supported by SIMOTION for the ET 200M distributed I/O system.

For a detailed and routinely updated list of I/O modules enabled with SIMOTION as well as application information, visit us online at:

SIEMENS Industry Online Support - Product support - Supplementary system components (https://support.industry.siemens.com/cs/de/en)

Further modules are integrated via the GSD file of the device's manufacturer.

Note

Note that in individual cases, additional supplementary conditions must be fulfilled.

Drive systems (via PROFINET IO)

Table 3-2 List of typically connected drive systems

Component	Function
SINAMICS S120	Servo drives, innovative single-axis and multi-axis solution

Optional components

Table 3-3 Optional components

Centralized I/O	Function
IsoPROFIBUS board	PROFIBUS connection
UPS	Uninterruptible Power Supply The drivers for the UPS are not pre-installed on the PC. Install the current drivers that are supplied with the UPS.

Note

An IsoPROFIBUS board may be inserted in addition to the PROFINET onboard.

3.3 HMI and SIMOTION SCOUT

3.3.1 HMI and SIMOTION SCOUT Overview

The operational sequences on the SIMOTION P320-4 are either monitored via the HMI system (Human Machine Interface) or the SIMOTION SCOUT engineering system.

The HMI or ES software can be connected using the following variants:

- Local (Page 58)
- via PROFINET (Page 70)
- via Ethernet (Page 71)
- via IsoPROFIBUS (optional) (Page 73)

Local communication of the HMI/ES

Only one local connection to the local SIMOTION Runtime is possible. If HMI or ES is also installed locally, **PC internal** can access other controllers/devices via PROFINET / PROFIBUS.

See Section Local HMI or ES on SIMOTION P320-4 (Page 58).

Communication of the HMI / ES via PROFINET / Ethernet / PROFIBUS

By using one of these communication variants, you can control and monitor several SIMOTION devices.

3.3.2 Local HMI or ES on SIMOTION P320-4

The model described below is used for the communication of the SIMOTION P320-4 with a local HMI or ES. The SIMOTION SCOUT engineering system or the HMI system can be installed directly on the **SIMOTION P320-4 S**.

For this model, you must set the communication (access point) to **TCP/IP** .

The SIMOTION P320-4 is already configured for this communication version at the time of delivery.

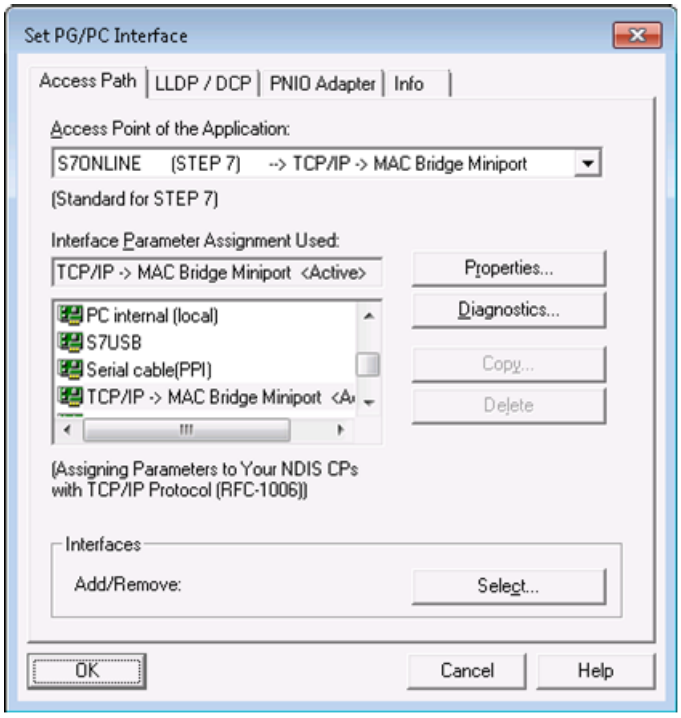


Figure 3-4 Set PG/PC Interface - TCP/IP -> MAC Bridge Miniport dialog box

Note

Local communication via Ethernet (TCP/IP)

For the communication via Ethernet (TCP/IP) to function locally, a link must be available to the Ethernet interface or a LAN cable must be connected **or** the MAC bridge set up.

Note

Setting up the MAC bridge miniport

See also Section Setting up a network bridge - MAC bridge miniport (Page 59)

Note

Only HMI-Runtime can be installed on the **SIMOTION P320-4 E** version.

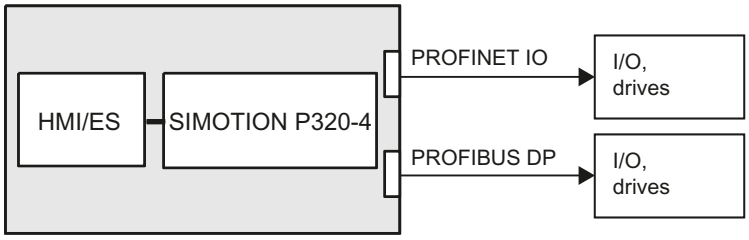

Figure 3-5 Model: Local HMI or ES

Alternatively to TCP/IP , SIMOTION SCOUT can also communicate locally via PC internal (local) .

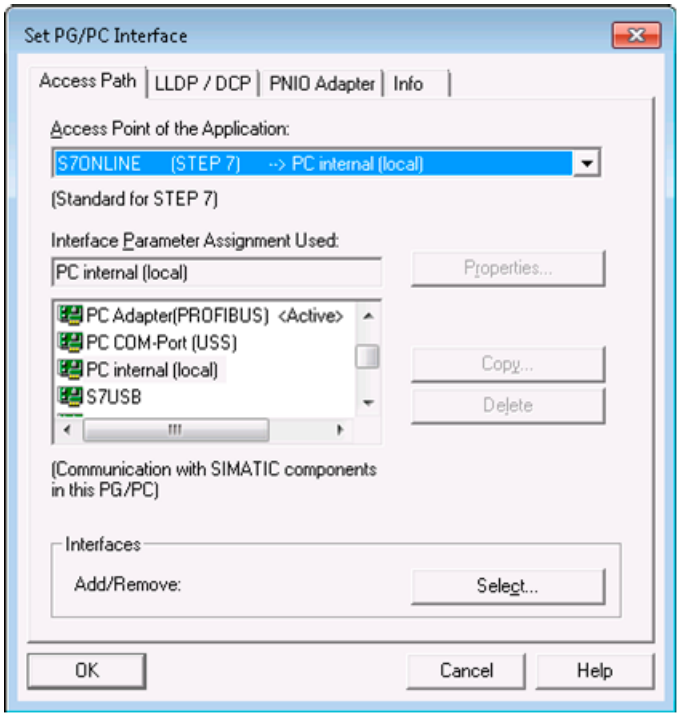

Figure 3-6 Set PG/PC Interface - PC internal (local) dialog box

3.3.2.1 Setting up a network bridge - MAC bridge miniport

Note

If you are working with SIMOTION P320-4 version V4.5, the Network Bridge is already preset.

The network bridge is not preset for version V4.4 and must be set up as described in the following.

The following is a step-by-step description of how the network bridge **MAC Bridge Miniport** is set up.

Network connections initial situation

Open the **Network and Internet** via the Control Panel.

- Select **Control Panel** > **All Control Panel Items** > **Network and Sharing Center** > **Change adapter settings**.
- Open the **Network and Internet** > **Network Connections** dialog box.
  The network connections of your PC are shown here.

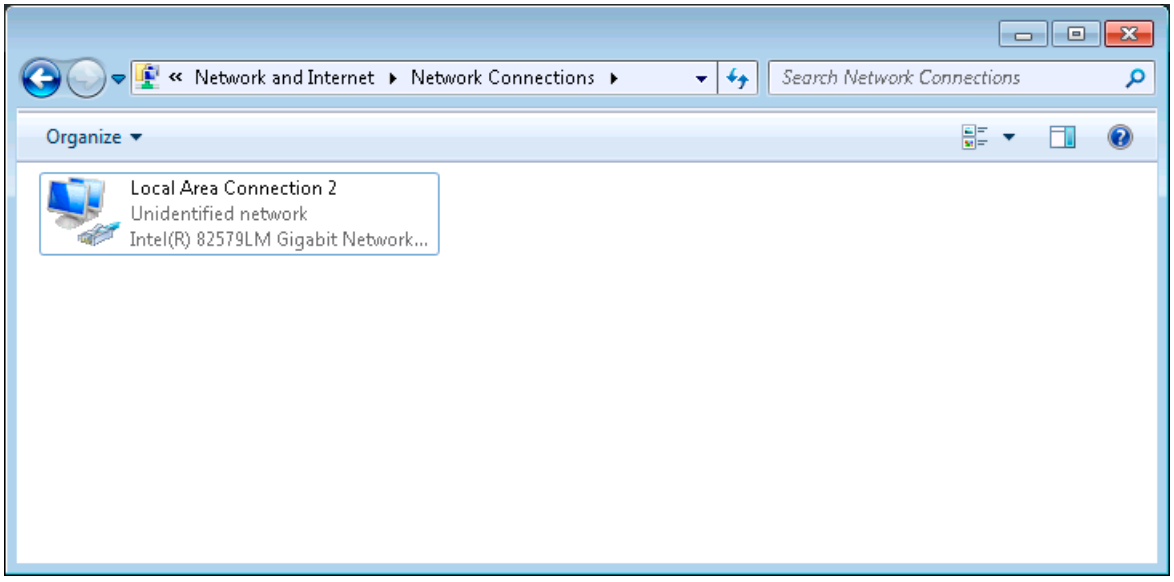

Figure 3-7 Initial situation - Network connections

Device Manager

Open the Device Manager via the Control Panel:

Control Panel > All Control Panel Items > System > Device Manager.

1. Select the **Network adapters** in the dialog box below the "SIMOTION PC".
   The available network connections are shown here.

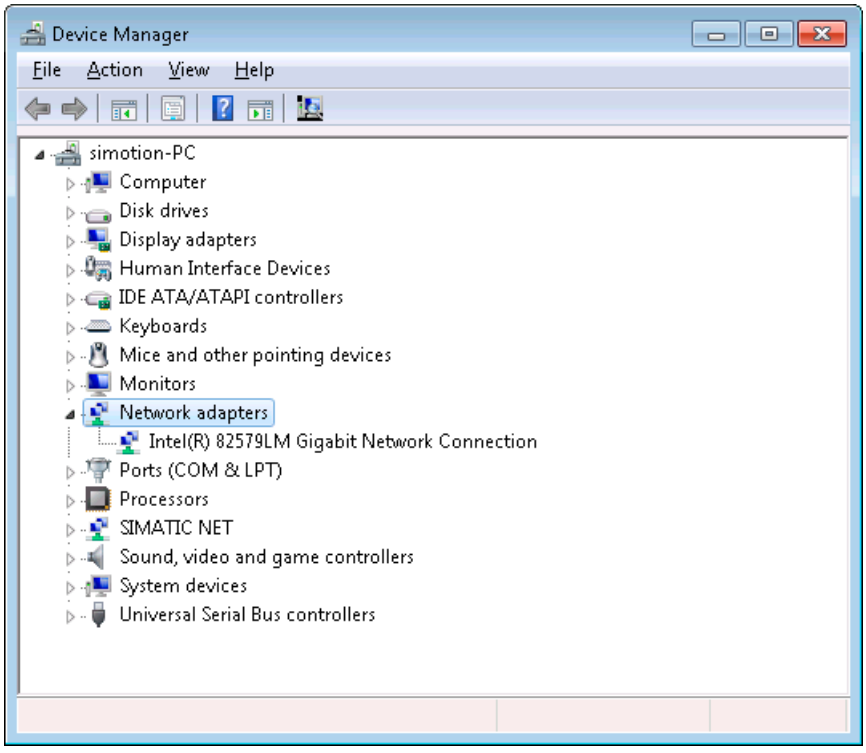

Figure 3-8 Opening the Device Manager

2. Install the **Microsoft Loopback Adapter** via the Device Manager.
3. To do this, select the menu **Action > Add legacy hardware**.
   The **Add Hardware Wizard** then opens.

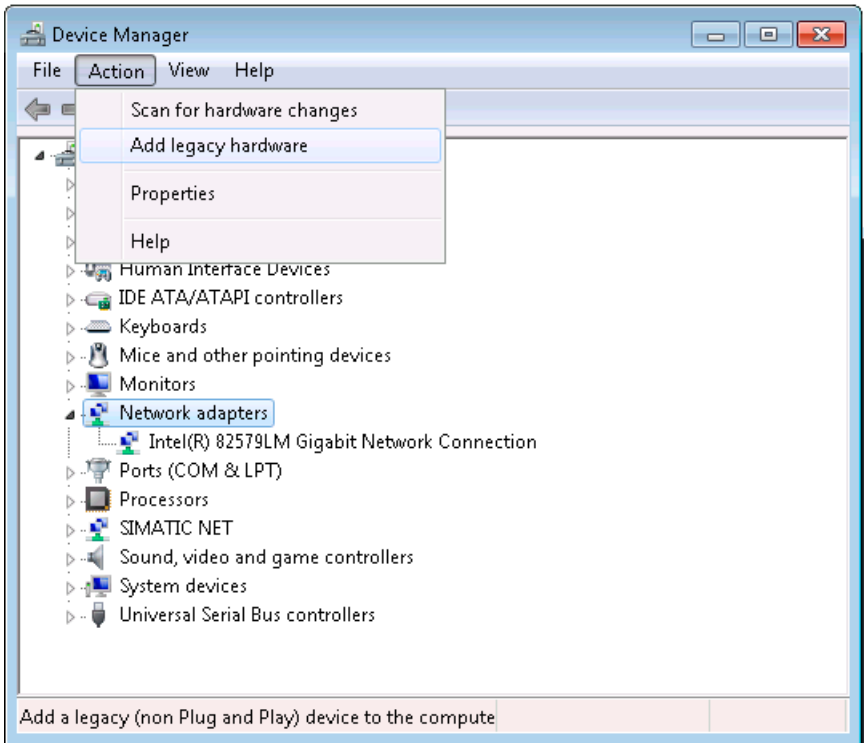

Figure 3-9 Device Manager - Action menu

Add Hardware Wizard

Use the **Add Hardware Wizard** to install the network bridge.

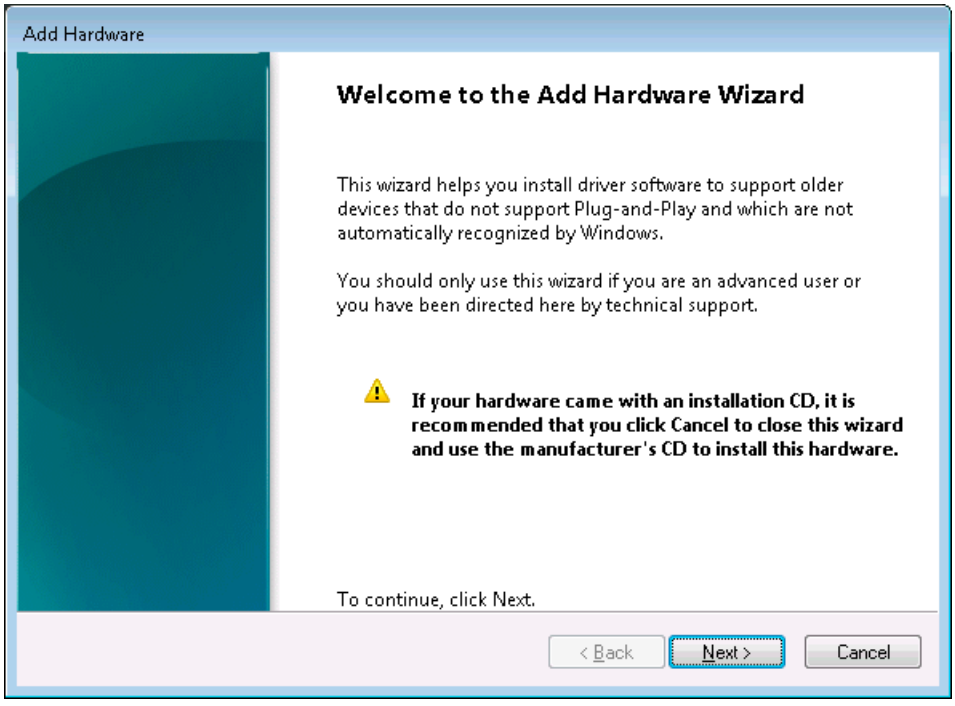

Figure 3-10 Add Hardware - Starting the wizard

1. Click **Next** to start the software wizard.
2. Select the option: **Install the hardware that I manually select from a list (Advanced)** and continue in the wizard with **Next**.

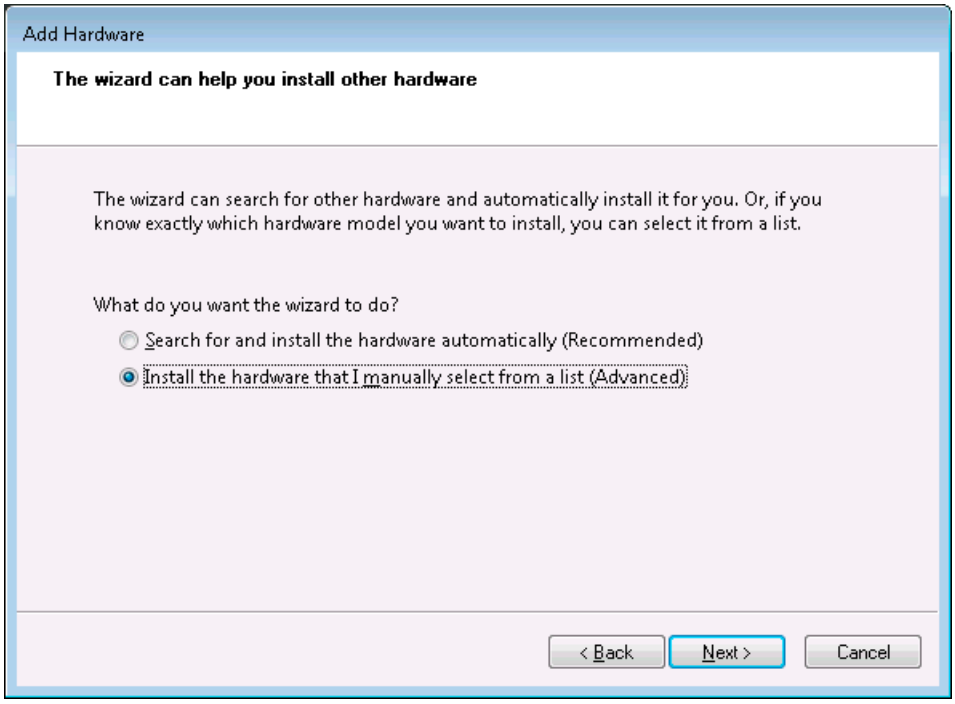

Figure 3-11 Add Hardware - Manual selection from a list

3. Select **Network adapters** in the dialog box now open and continue in the wizard with **Next**.

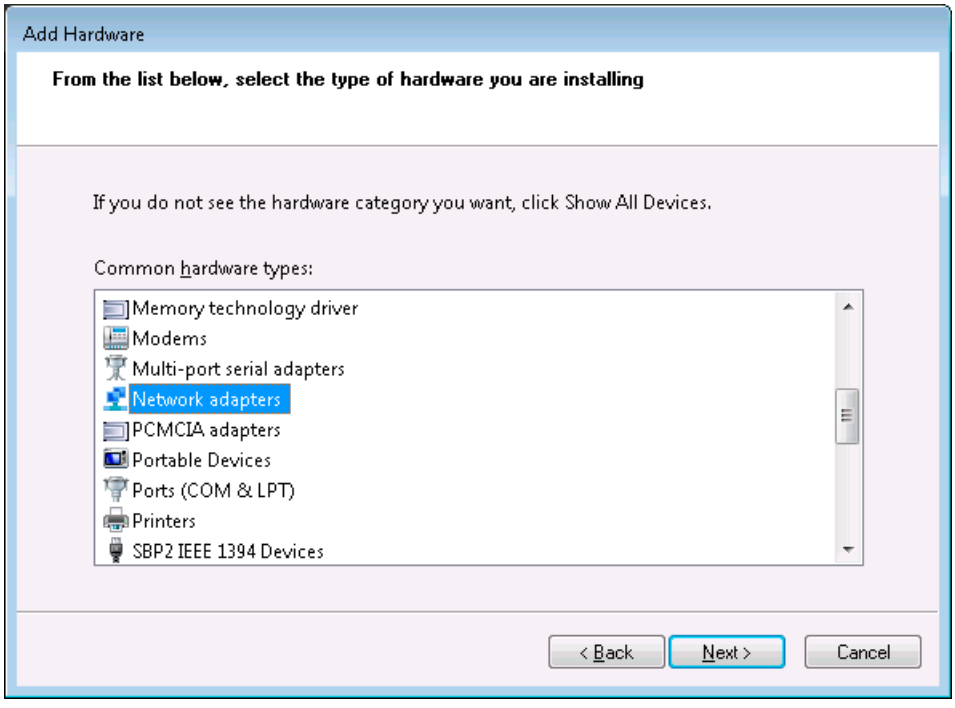

Figure 3-12 Select Add Hardware - Network adapters

4. In the following dialog box, select the **Microsoft Loopback Adapter**.
5. To do this, select Microsoft at **Manufacturer** and the Microsoft Loopback Adapter at **Network Adapter**.
6. Continue in the wizard with **Next**.

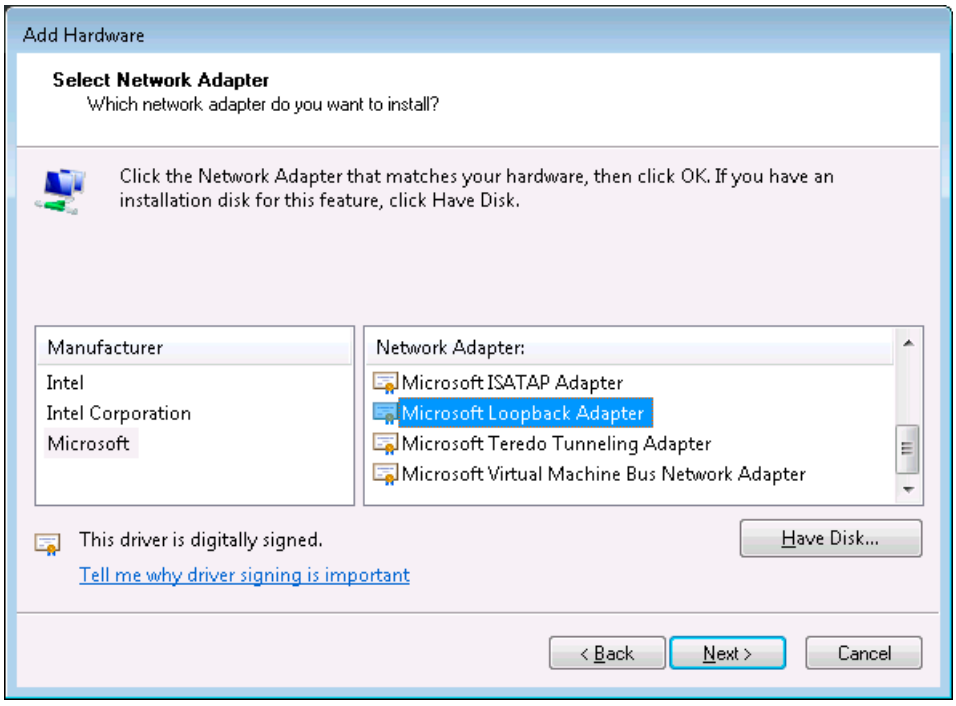

Figure 3-13 Add Hardware - Selecting the desired Network Adapter

7. The selected Network Adapter is shown in the following dialog box.
   Click **Next** to confirm and install.

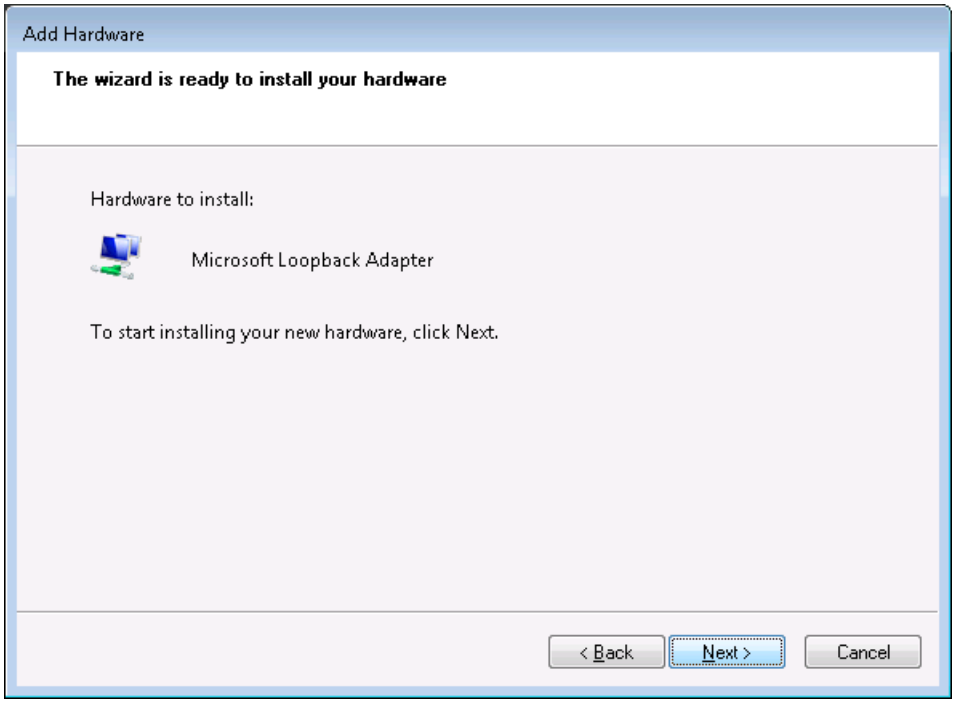

Figure 3-14 Add Hardware - Selected Network Adapter can be installed

8. After finishing the installation, the following dialog box is displayed.
   Exit the wizard with **Finish**.

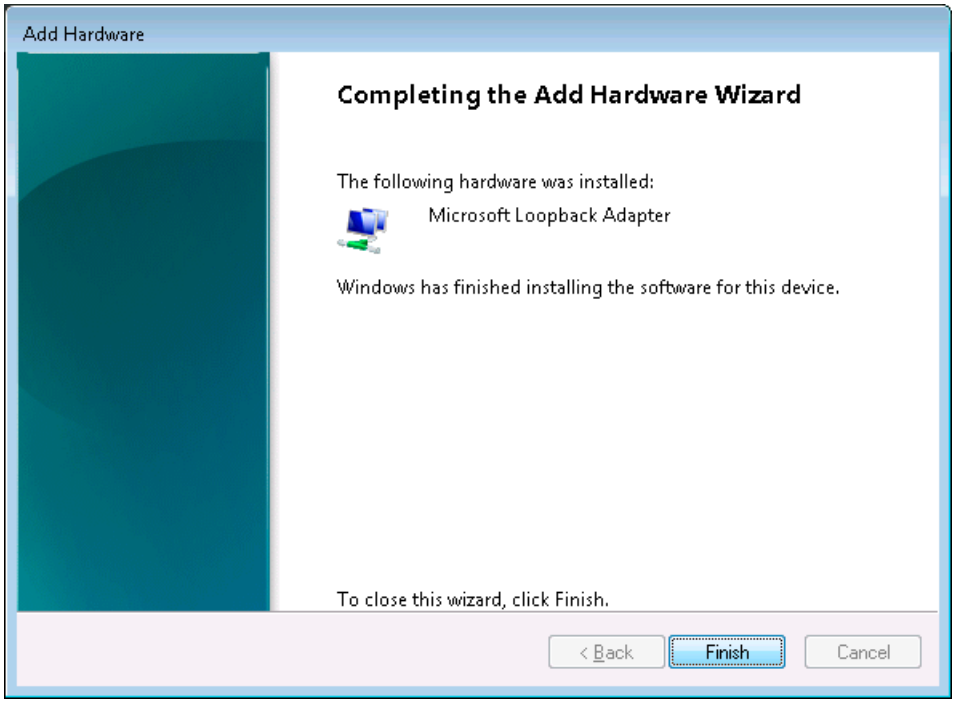

Figure 3-15 Add Hardware - Installation of the Microsoft Loopback Adapter is finished

Checking the installation of the network adapter

You can check the successful installation of the **Microsoft Loopback Adapters** in the

- Device Manager
- Internet connections

Device Manager

The Microsoft Loopback Adapter is displayed at **Network adapters** in the Device Manager.

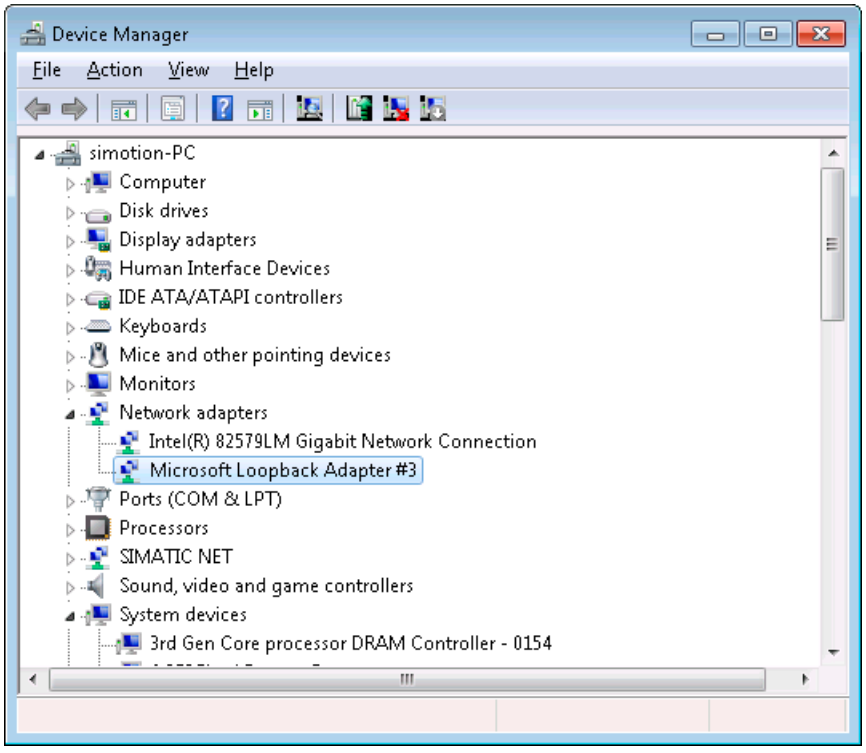

Figure 3-16 Device Manager - Microsoft loopback adapter

Network connections

The newly installed Microsoft Loopback Adapter is also displayed at **Network Connections**.

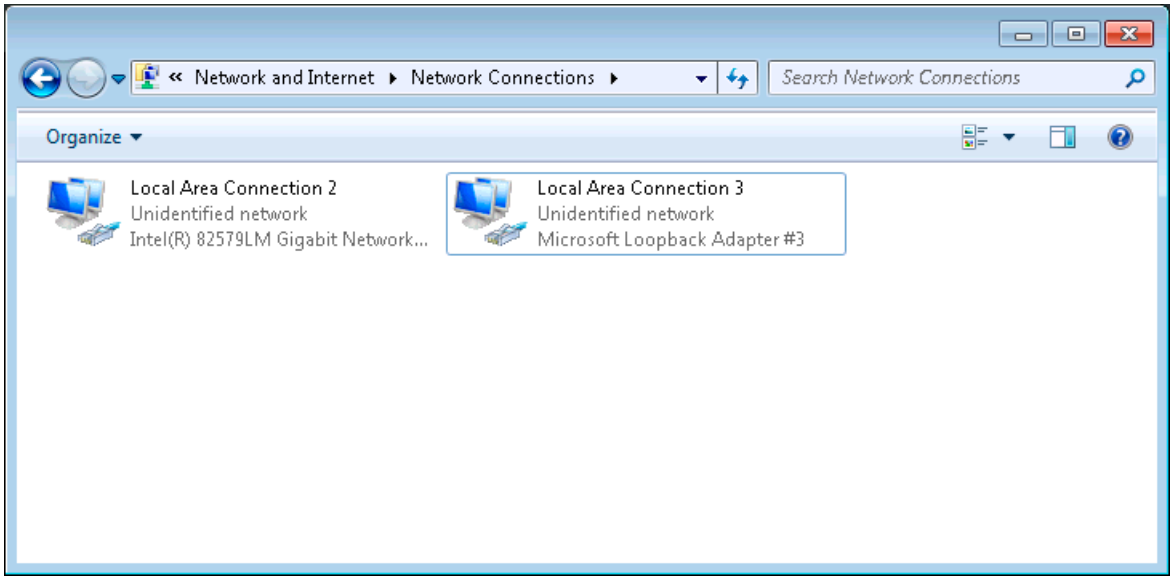

Figure 3-17 Network connections - Display of the newly installed Microsoft loopback adapter

Creating the network bridge

To activate the network bridge, proceed as follows:

1. Select both adapters at Network Connections
2. Select Bridge Connections via the context menu.

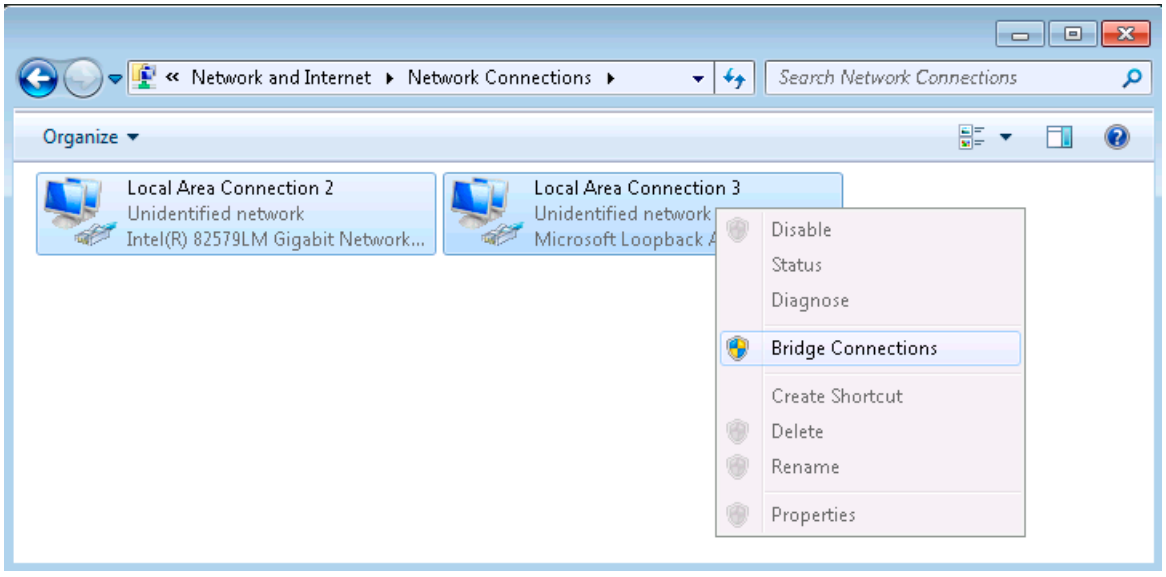

Figure 3-18 Network Connections - Setting the Bridge Connection

3. The Network Bridge MAC Bridge Miniport is displayed.

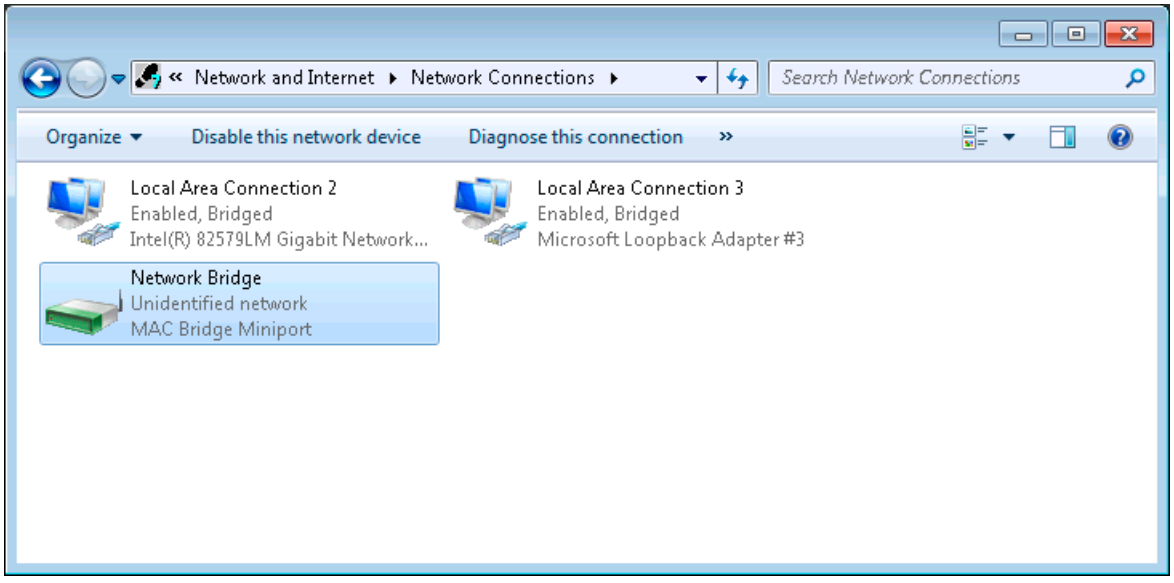

Figure 3-19 Network Connections - Display of the Network Bridge MAC Bridge Miniport

4. To initialize the network bridge, execute the **sp_bridge.cmd** Windows command script.
   The additional script can be found at C:\SiMotion\tools\sp_bridge.cmd
   After executing the batch file, the network bridge has been set up.

Setting "Set PG/PC interface"

Now open the PG/PC interface to complete the setting for the **Network Bridge** .

1. Open the **Set PG/PC Interface** dialog box via the **Control Panel** entry point.
2. Deactivate the **MAC Bridge Miniport DCP** checkbox in the **LLDP / DCP** tab.
   If you do not deactivate the MAC Bridge Miniport DCP, the SIMOTION P320-4 may not be found via Accessible nodes.

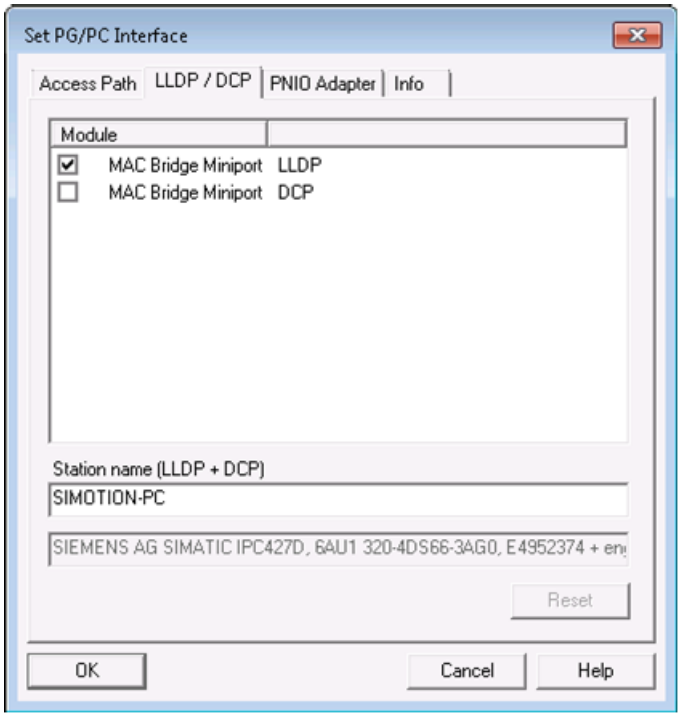

Figure 3-20 Set PG/PC interface

The settings for the network bridge have now been completed.

3.3.3 HMI or ES via PROFINET

Networking via PROFINET

PROFINET is the innovative and open Industrial Ethernet standard (EN 61158) for industrial automation. With PROFINET, devices can be linked up from the field level through to the management level.

With PROFINET, an external HMI or ES can also be integrated into the network and data can be exchanged directly with the SIMOTION P320-4 device.

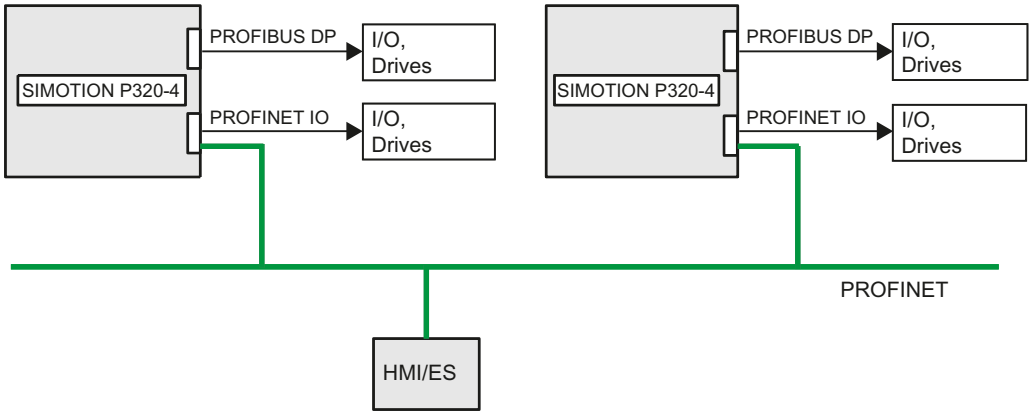

Figure 3-21 Model: Networking via PROFINET

References

You can find further information on the HMI in the documentation:

- SIMOTION Runtime Basic Functions, Section HMI (Human Machine Interface) coupling.
- SIMOTION SCOUT, Configuration Manual
- SIMOTION SCOUT TIA, Configuration Manual
- SIMOTION SCOUT TIA Device Proxy, Configuration Manual

3.3.4 HMI or ES via Ethernet

Networking via Ethernet

A complex interconnection with several HMIs or ESs is only possible using an Ethernet communication. This allows both an external HMI or ES to access several SIMOTION devices or one SIMOTION device to access another one, for example, to display the production data.

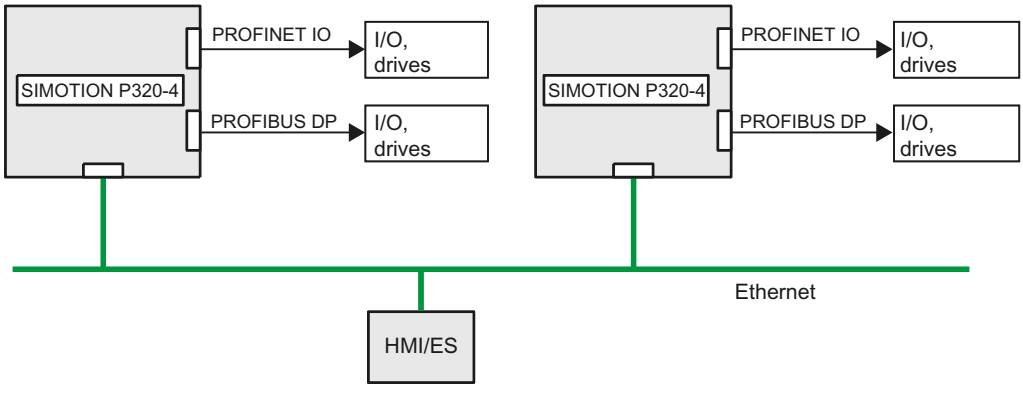

Figure 3-22 Model: Networking via Ethernet

The following services are possible on a SIMOTION device via Ethernet:

- HMI software
  WinCC flexible or the OPC server can use Ethernet to access one or more SIMOTION devices.
- SIMOTION SCOUT Engineering System
  SIMOTION SCOUT can also use Ethernet to access one or more SIMOTION devices.
- SIMOTION IT
  SIMOTION P320-4 offers communication with standard IT protocols (HTTP) over the integrated Ethernet interface.
  This makes it possible to access data or diagnostic information in the SIMOTION P320-4 from any location via intranet or the Internet.
- HTTP (browser, OPC XML)
  Setting in WebCFG.xml - default 80
- HTTPS (browser, OPC XML)
  Setting in WebCfg.xml - default 443
- FTP 21
- Telnet

Note

Information on the SIMOTION IT security concept

More detailed information on the SIMOTION IT security concept of HTTP/S, FTP and Telnet access on the Web server can be found in the following documentation:

- SIMOTION IT Diagnostics and Configuration, Diagnostics Manual, Section security concept

References

You can find further information in the documentation for SIMOTION IT:

- SIMOTION IT Diagnostics and Configuration
- SIMOTION IT Programming and Web Services
- SIMOTION IT Virtual Machine and Servlets

3.3.5 HMI or ES via IsoPROFIBUS (optional)

Networking via PROFIBUS DP

If you connect a central HMI via PROFIBUS DP, the X101 and X102 interfaces of the IsoPROFIBUS board are available.

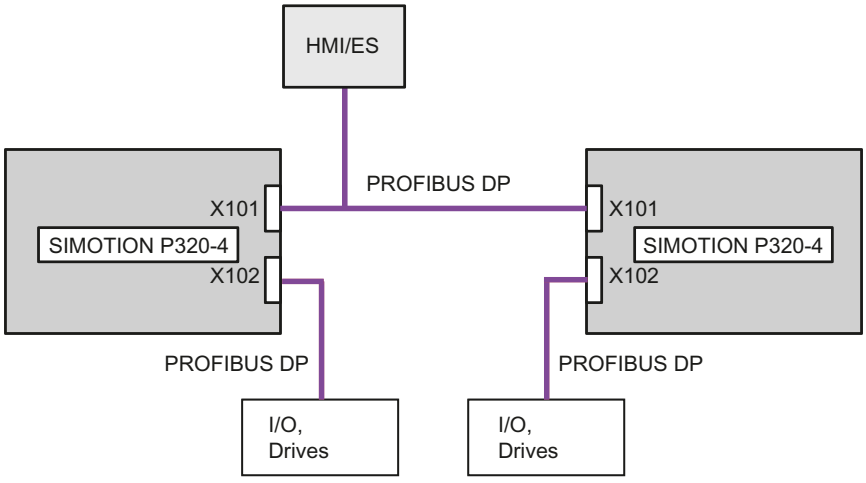

Figure 3-23 Model: Networking via PROFIBUS DP

References

You can find further information on the HMI in the documentation:

- SIMOTION Runtime Basic Functions, section HMI (Human Machine Interface) coupling.

Application planning

4

4.1 Unpacking and checking the delivery

Procedure

1. When accepting a delivery, please check the packaging for visible transport damage.
2. If any transport damage is present at the time of delivery, lodge a complaint at the shipping company in charge. Have the shipper confirm the transport damage immediately.
3. Unpack the device at its installation location.
4. Keep the **original packaging** in case you have to transport the device again.

   Note

   Damage to the device during transport and storage

   If a device is transported or stored without packaging, then shocks, vibrations, pressure and moisture may impact the unprotected device.
   A damaged packaging indicates that ambient conditions have already had a massive impact on the device.

   The device may be damaged.

   Do not dispose of the original packaging. Pack the device for transport and storage in the **original packaging**.

5. Check the contents of the packaging and any accessories you may have ordered for completeness and damage.

6. If the contents of the packaging are incomplete, damaged or do not match your order, inform the responsible delivery service **immediately**.

⚠ WARNING
Electric shock and fire hazard due to damaged device A damaged device can be under hazardous voltage and trigger a fire in the machine or plant. A damaged device has unpredictable properties and states. Death or serious injury could occur. Make sure that the damaged device is not inadvertently installed and put into operation. Label the damaged device and keep it locked away. Send off the device for immediate repair.

NOTICE
Damage from condensation If the device is subjected to low temperatures or extreme fluctuations in temperature during transportation, for example in cold weather, moisture could build up on or inside the HMI device. Moisture can result in short-circuits in electrical circuits and damage the device. In order to prevent damage to the device, proceed as follows: • Store the device in a dry place. • Bring the device to room temperature before starting it up. • Do not expose the device to direct heat radiation from a heating device. • If condensation develops, wait approximately 12 hours or until the device is completely dry before switching it on.

7. Please keep the enclosed documentation, it belongs to the device. You need the documentation when you commission the device for the first time.
8. Write down the identification data of the device.

4.2 Identification data of the device

Based on the identification data, the SIMOTION P320-4 device can be identified when service is required or in case of theft.

You also require the identification data in order to view further information on your SIMOTION P320-4 in the **Product Equipment Data** (PED) database.
All the important components of your SIMOTION P320-4 are stored in the PED. The entire history of the device is stored there, including the service reports.
To identify yourself in the PED database, enter the article number and the serial number of your device.

Link to the PED database

The Product Equipment Data database is available on the Internet via the following link (http://www.siemens.com/ped).

Identification data

Enter the identification data in the following table:

Identification data	Source	Value
Serial number	Rating plate	S VP ...
Article number of the device	Rating plate	6AU1320-...
Microsoft Windows Product Key Certificate of Authenticity (COA)	Rear of the device	Only devices with preinstalled Windows operating systems have COA labels
Ethernet address 1	BIOS setup, menu "Advanced", "Peripheral Configuration"	Input by the user.
PROFINET onboard MAC Address Layer 2		
PROFINET onboard MAC Address PROFINET		

SIMOTION P320-4 rating plate

Example of SIMOTION P320-4 S (standard)

You will find the following data on the rating plate of the SIMOTION P320-4:

- Device designation (here): SIMOTION P320-4 S
- Article number of the device (here): 6AU1320-4DS66-3AG0
- Serial number S VP<...>
  The computing unit is uniquely identifiable with the serial number at S VP <...>.
  <...> is an 8-digit character string.
- cULus Approval
- CE marking

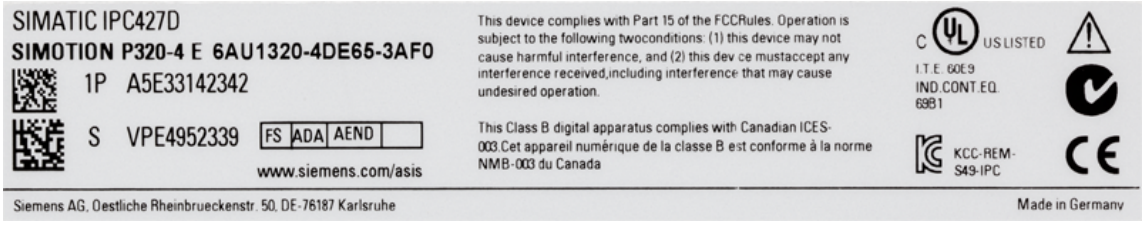

Figure 4-1 SIMOTION P320-4 rating plate

MAC addresses

Example of SIMOTION P320-4 S (standard)

In addition to the data that is found on the SIMOTION P320-4 rating plate, the MAC address plate also contains the **Onboard MAC addresses** for:

- ETHERNET (LAN) X1: VIPCTYSMAC1
- PROFINET (LAN) X3: VIPCTYSPROFINET

The data cited here is not real data.

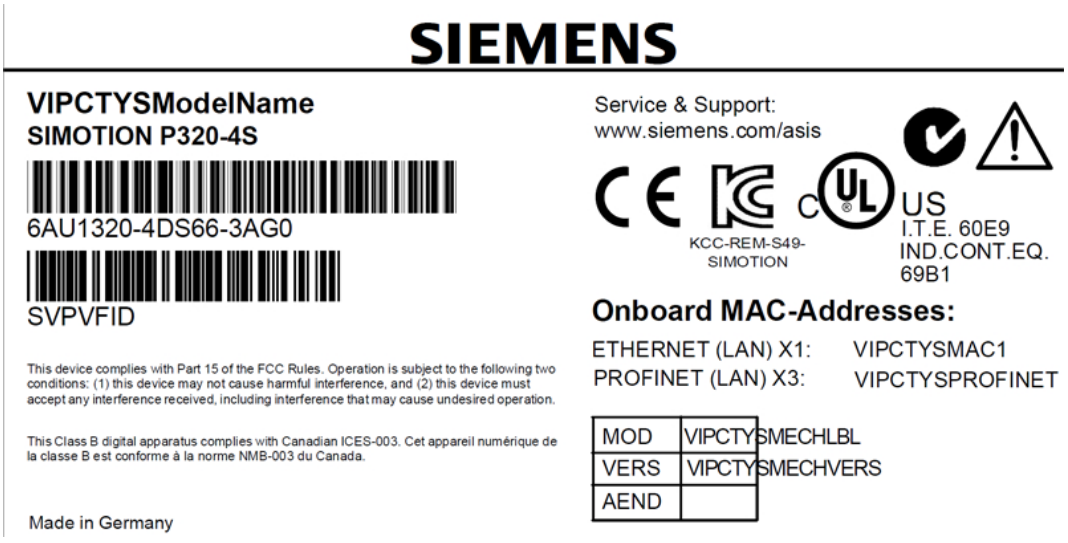

Figure 4-2 SIMOTION P320-4 S rating plate - MAC addresses

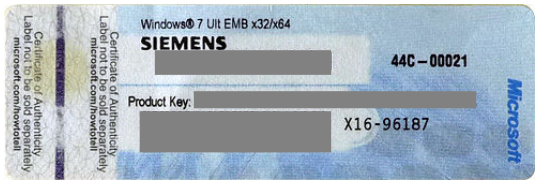
Example of a COA label



Microsoft Windows "Product Key" of the "Certificate of Authenticity" (COA):
The COA label is attached to the rear of all devices containing a Windows Embedded Standard 7 or Windows 7 operating system.

- COA label of a device with Windows Embedded Standard 7 32-bit operating system

Figure 4-3 ipc477d label coa 01

- COA label of a device with Windows 7 operating system

4.3 Permissible mounting positions

Information on the permissible mounting positions for the SIMOTION P320-4 can be found in the section Installation/mounting > Permissible mounting positions (Page 95).

4.4 Environmental conditions

Operating conditions

The SIMOTION P320-4 is designed for use in stationary, weather-protected locations.
The operating conditions exceed requirements according to EN 61131-2.

Observe the following points during installation:

- Note the climatic and mechanical environmental conditions specified in Section Technical specifications (Page 121).
- The device is designed for use in a normal industrial environment. Without additional protective measures (such as the provision of clean air), the SIMOTION P320-4 computing unit cannot be used in places with severe operating environments, for example, locations with corrosive vapors or gases.
- The clearance in the area of the ventilation slots must be at least 100 mm, so that the SIMOTION P320-4 receives sufficient ventilation.
- Do not cover the ventilation slots of the device.
- The DC power supply does not meet requirements according to EN 60950-1 in the area of the power unit connection. As such, SIMOTION P320-4 must be installed so that it is part of an operating area with restricted access (e.g. a locked control cabinet, console or server room).
- Always observe the mounting positions permitted for this device.
- The connected or installed I/O should not generate a reverse voltage greater than 0.5 V in the device.

⚠ WARNING

Invalidation of the approvals

Failure to adhere to these conditions when installing the system will invalidate approvals according to UL 60950-1, UL 508, and EN 60950-1!

Use prohibition

Without additional measures, the SIMOTION P320-4 should not be used in

- Locations with a high percentage of ionizing radiation
- Aggressive environments characterized, for example, by:
  - Dust accumulation
  - Corrosive vapors or gases
- at locations outside of the prescribed ambient conditions
- Installations requiring special monitoring such as:
  - Elevator installations
  - Electrical plants in particularly hazardous areas

An additional measure for using the SIMOTION P320-4 could be its installation in a cabinet.

Ambient conditions

For the mechanical and climatic environmental conditions, refer to the technical specifications in the section Ambient conditions (Page 124).

4.5 Electromagnetic compatibility

Definition

Standards for electromagnetic compatibility (EMC) are fulfilled if the EMC Installation Guideline is complied with.

See also:

Further information is provided in the Appendix, Section General regulations (Page 139).

Interfaces

5

5.1 Hardware components of the SIMOTION P320-4

Note

The article numbers of the components listed below can be obtained from the online catalog in the Siemens Industry Mall (http://www.siemens.com/industrymall).

SIMOTION P320-4 complete system

The SIMOTION P320-4 device is supplied with the integrated PROFINET onboard communication module.

An additional IsoPROFIBUS board can be inserted as required.

SIMOTION P320-4 spare parts

The SIMOTION P320-4 consists of the following hardware components:

- **SIMOTION P320-4** computing unit
- **Back-up battery** for the motherboard of the SIMOTION P320-4
- IsoPROFIBUS board (optional communication module for the SIMOTION P320-4)

Operation and display

The following hardware components for operation and display can be used:

- SIMATIC Industrial Flat Panel, in the variants IFP1500, IFP1900 or IFP2200.

Power supply of the SIMOTION P320-4

The power supply must satisfy the requirements as described in section Connecting the power supply (24 VDC) (Page 109). This can be ensured by using the following devices, for example:

- SITOP smart 24 V / 10 A
- 24 VDC UPS (optional)

Drives and I/O modules

The drives and I/O modules released for use with SIMOTION are specified on the website: www.siemens.com/simotion (www.siemens.com/simotion)

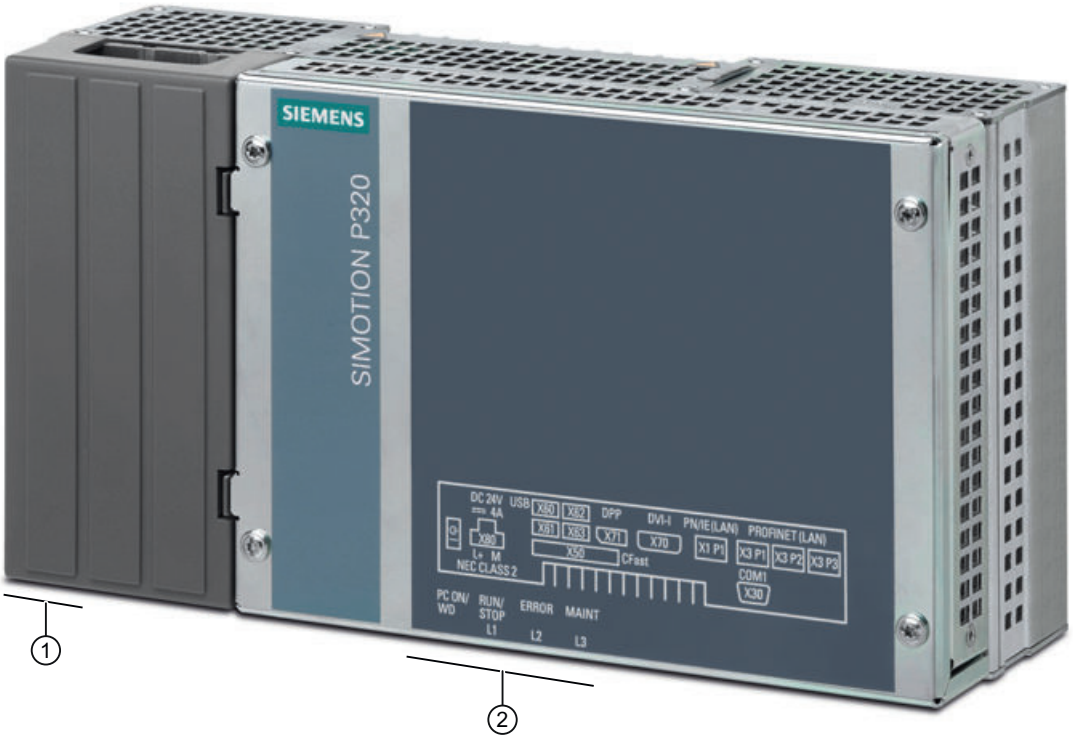
Note

Please note that not all modules of the I/O or I/O systems mentioned are approved for SIMOTION. Moreover, system-related functional differences can occur when these I/O or I/O systems are used on SIMOTION rather than SIMATIC. For example, special process-control functions (hot swapping, etc.) are not supported by SIMOTION for the ET 200M distributed I/O system.

A detailed and routinely updated list of I/O modules released for SIMOTION as well as instructions on their use is provided on the Internet at Siemens Product Support (https://support.industry.siemens.com/cs/ww/en/view/11886029).

In addition to the I/O modules approved for SIMOTION, all certified standard slaves can, in principle, be connected to SIMOTION provided that they support the following data traffic:

- Cyclic data traffic (DP V0)
- Acyclic data traffic (DP V1)
- Isochronous data traffic (DP V2)



These modules are integrated via the GSD file of the device's manufacturer.

Note

Please note that in individual cases, additional boundary conditions must be fulfilled in order to integrate a standard slave into SIMOTION.

5.2 Overview of operator control and display elements

The following figure shows the arrangement of the indication and control elements of the SIMOTION P320-4.

① On/Off switch
② Operating displays (LEDs)

Figure 5-1 SIMOTION P320-4 control and display elements

5.3 Control elements

On/Off switch

① **Requirement**:
The BIOS setup entry **After Power Failure** is set to **Power on**.
The On/Off switch is used to switch the SIMOTION P320-4 on.

Figure 5-2 SIMOTION P320-4 - operator controls

⚠ WARNING

De-energize the SIMOTION P320-4!

The On/Off switch does not disconnect the device from the power supply system.
When the switch is in position **0** (Off), the device is still supplied with mains voltage.

To remove power from the device, the power supply plug must be removed.

NOTICE

Close down the operating system first

First close down the operating system before switching off the device with the on/off switch, otherwise data may get lost.

5.4 Status displays

The status indicators below the interfaces are described in the following table.

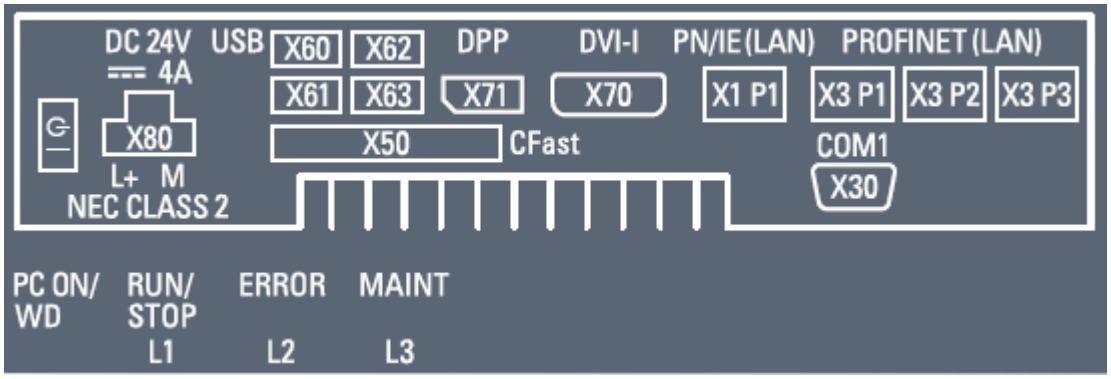


Figure 5-3 SIMOTION P320-4 status indicator

LED	Meaning	State	Description
PC ON/ WD	Power supply	Green	BIOS ready to boot. Indicates the correct supply voltage of 3.3 V, 5 V and 12 V from the integrated power unit.
		Off	Not relevant.
		Green/yellow flash-ing (1 Hz)	BIOS in POST, power switch on.
		Yellow	Idle state
RUN/STOP or L1	RUN STOP	Off	SIMOTION P Runtime is not running.
		Green	SIMOTION P320-4 in RUN.
		Yellow	SIMOTION P320-4 in STOP.
		Green/yellow: Flashes quickly (2 Hz)	DCP flashing
		Yellow: Flashes quickly (5 Hz)	FAULT state (only in combination with L2 and L3)

LED	Meaning	State	Description
ERROR or L2 (SF PROFINET LED)	-	Off	SIMOTION P320-4 is working error-free.
	Error	Red: Continuous light	Bus error at the PROFINET interface.
		Red: Flashes quickly (2 Hz)	Erroneous configuration.
		Red: Flashes quickly (5 Hz)	FAULT state (only in combination with L1 und L3)
	INIT	Red: Flashes slowly (0.5 Hz)	During the INIT process, the SF PROFINET LED is controlled by the boot loader. The precise flashing behavior therefore cannot be determined and displayed. In the INIT state, 0.5 Hz flashing is displayed in the SIMOTION P State. If no project has yet been loaded, 0.5 Hz flashing is also displayed for the INIT, which, in this case, is also retained in the Running state.
MAINT or L3 (SF LED)	-	Off	SIMOTION P320-4 works error-free.
	Error	Red	An event has occurred which needs to be acknowledged (alarm, message, notification). (See Diagnostics Guide)
		Red: Flashes slowly (0.5 Hz)	License missing for licensed technology objects. Carry out the licensing to correct the error. Further information on the licensing can be found in the SIMOTION P320-4 E / SIMOTION P320-4 S Commissioning and Hardware Installation Manual.
		Red: Flashes quickly (5 Hz)	FAULT state (only in combination with L1 and L2) A fault has occurred to which the user program cannot respond. The following actions may be required to rectify the fault: • Power OFF/ON • Recommissioning

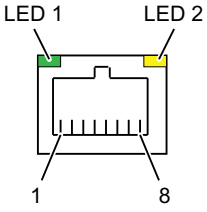
5.5 Overview of the SIMOTION P320-4 interfaces

The following table provides an overview of the SIMOTION P320-4 interfaces.

Table 5-1 Overview of the interfaces

Interface	Description	Further information
PROFINET	Three PROFINET ports with RJ45 socket	PROFINET onboard interface (Page 87)
Ethernet	1 x 8-pole RJ45 interface	Ethernet RJ45 interface (Page 88)
DVI-I	26-pin socket for connection of a CRT or LCD monitor with DVI interface or VGA with DVI/VGA adapter	DVI-I interface (Page 88)

Interface	Description	Further information
Display port	20-pole DPP interface	Display port interface (Page 90)
USB 3.0	Lower USB channel 0, upper USB channel 1 Lower USB channel 2, upper USB channel 3	USB 3.0 interface (Page 90)
CFast card	Slot for CFast card 50-pin CF socket, types I/II	CFast card (Page 91)
COM1	Serial interface *V.24*	Serial interface COM1 (Page 92)
IsoPROFIBUS board (optional)	2 x 9-pin socket	IsoPROFIBUS board (optional) (Page 92)



5.6 PROFINET onboard

Interface assignment

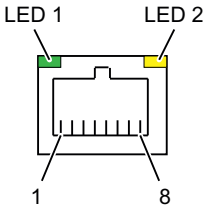
Designation: PROFINET LAN, X3, 3 ports: P1, P2, P3

Type: 8-pin RJ45 socket

PROFINET onboard LAN (X3) interface

Pin no.	Short description	Meaning	Input/output
1	RD+	Receive data [2]	Input
2	RD-	Receive data [2]	Input
3	TD+	Send data [2]	Output
4, 5 [1]	SYMR	Internal 75 Ohm terminating resistor	-
6	TD-	Receive data [2]	Output
7, 8 [1]	SYMT-	Internal 75 Ohm terminating resistor	-
S	-	Shield	-
-	LED 1	Lights up green: Link	-
-	LED 2	Lights up yellow: Activity	-

[1] Optional product feature



[2] Autonegotiation and autocrossover are supported.

5.7 Ethernet

Interface assignment

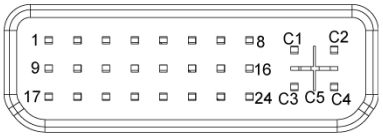
Designation: PN/IND. Ethernet (LAN), X1

Type: 8-pin RJ45 socket

Ethernet RJ45 interface			
			
Pin no.	**Short description**	**Meaning**	**Input/output**
1	BI_DA+	Bi-directional data A+	Input/output
2	BI_DA-	Bi-directional data A-	Input/output
3	BI_DB+	Bi-directional data B+	Input/output
4	BI_DC+	Bi-directional data C+	Input/output
5	BI_DC-	Bi-directional data C-	Input/output
6	BI_DB-	Bi-directional data B-	Input/output
7	BI_DD+	Bi-directional data D+	Input/output
8	BI_DD-	Bi-directional data D-	Input/output
S	–	Shield	–
	LED 1	Off: 10 Mbps Green light: 100 Mbps Orange light: 1000 Mbps	–
	LED 2	Lit: Active connection, e.g., to a hub Flashing: Activity	–

Note

The interfaces available on the device have been numbered for unique identification.



This numbering may deviate, however, from the numbering assigned by the operating system.

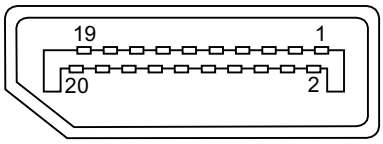
5.8 DVI-I

Interface assignment

Designation: DVI/VGA, X70

Type: 26-pin socket

DVI-I interface (standard socket)			
			
Pin no.	**Short description**	**Meaning**	**Input/output**



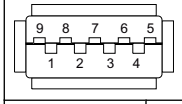
DVI-I interface (standard socket)			
1	TMDS Data2-	DVI data channel	Output
2	TMDS Data2+	DVI data channel	Output
3	TMDS Data2/4 shield	Cable shield	-
4	NC	-	-
5	NC	-	-
6	DDC clock (SCL)	Display Data Channel – Clock	Input/output
7	DDC data (SDA)	Display Data Channel – Data	Input/output
8	Analog vertical sync (VSYNC)	Analog Vertical Sync Signal	Output
9	TMDS Data1-	DVI data channel	Output
10	TMDS Data1+	DVI data channel	Output
11	TMDS Data1/3 shield	Cable shield	-
12	NC	-	-
13	NC	-	-
14	+5 V power (VCC)	+5 V power for DCC	Output
15	Ground (return for +5 V, Hsync and Vsync) (GND)	Analog ground	-
16	Hot Plug Detect	-	-
17	TMDS data 0-	DVI data channel	Output
18	TMDS data 0+	DVI data channel	Output
19	TMDS Data0/5 shield	Cable shield	-
20	NC	-	-
21	NC	-	-
22	TMDS clock shield	Cable shield	-
23	TMDS clock+	DVI clock channel	Output
24	TMDS clock-	DVI clock channel	Output
C1	Analog red (R)	Analog red signal	Output
C2	Analog green (G)	Analog green signal	Output
C3	Analog blue (B)	Analog blue signal	Output
C4	Analog horizontal sync (HSYNC)	Analog horizontal sSync signal	Output
C5	Analog ground (analog R, G, & return) (GND)	Analog ground	-

5.9 DisplayPort

Interface assignment

Designation: Display port interface, X71

Type: 20-pole DPP interface



Display port interface			
			
Pin no.	**Short designation**	**Meaning**	**Input/output**
1	ML_Lane0+	DP data 0+	Output
2	GND	Ground	-
3	ML_Lane0-	DP data 0-	Output
4	ML_Lane1+	DP data 1+	Output
5	GND	Ground	-
6	ML_Lane1-	DP data 1-	Output
7	ML_Lane2+	DP data 2+	Output
8	GND	Ground	-
9	ML_Lane2-	DP data 2-	Output
10	ML_Lane3+	DP data 3+	Output
11	GND	Ground	-
12	ML_Lane3-	DP data 3-	Output
13	CONFIG1 CAD	Cable Adapter Detect	Input
14	CONFIG2	Ground (PullDown)	-
15	AUX_CH+	Auxiliary channel+	Bidirectional
16	GND	Ground	-
17	AUX_CH-	Auxiliary channel-	Bidirectional
18	HPD	Hot Plug Detect	Input
19	GND	Ground	-
20	DP_PWR	+3.3V (fused)	Output

5.10 USB 3.0

Interface assignment

Designation: USB X62, X61, X62, X63

Type: 9-channel *high current*

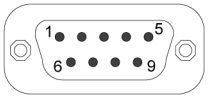
USB 3.0 interface			
			
Pin no.	**Short designation**	**Meaning**	**Input/output**
1	VBUS	+ 5 V (fused)	Output
2	D-	Data line	Input/output

USB 3.0 interface			
3	D+	Data line	Input/output
4	GND	Ground	–
5	RX-	Data line	Input
6	RX+	Data line	Input
7	GND	Ground	–
8	TX-	Data line	Output
9	TX+	Data line	Output

5.11 CFast card

Pin assignment of the interface

Designation: CFast X50



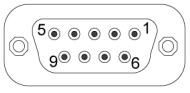
Pin no.	Short designation	Meaning
S1	SGND	Signal GND (ground for signal integrity)
S2	A+	SATA differential
S3	A-	SATA differential
S4	SGND	Signal GND (ground for signal integrity)
S5	B-	SATA differential
S6	B+	SATA differential
S7	SGND	Signal GND (ground for signal integrity)
PC1	CDI	Card Detect Out
PC2	GND	Device GND
PC3	TBD	TBD (not connected)
PC4	TBD	TBD (not connected)
PC5	TBD	TBD (not connected)
PC6	TBD	TBD (not connected)
PC7	GND	Device GND
PC8	LED1	LED Output (not connected)
PC9	LED2	LED Output (not connected)
PC10	IO1	Reserved Input/Output (not connected)
PC11	IO2	Reserved Input/Output (not connected)
PC12	IO3	Reserved Input/Output (not connected)
PC13	PWR	Device Power (3.3V)
PC14	PWR	Device Power (3.3V)
PC15	GND	Device GND
PC16	GND	Device GND
PC17	CDO	Card Detect In

5.12 COM1

Interface assignment

Designation: COM1, X30

Type: 9-pin (connector)



Serial interface COM1			
			
Pin no.	**Short designation**	**Meaning**	**Input/output**
1	DCD	Data carrier detect	Input
2	RxD	Receive data	Input
3	TxD	Transmit data	Output
4	DTR	Data terminal ready	Output
5	GND	Ground	-
6	DSR	Data set ready	Input
7	RTS	Request to send	Output
8	CTS	Clear to send	Input
9	RI	Incoming call	Input

5.13 IsoPROFIBUS board (optional)

Interface assignment

Designation: PROFIBUS, X101, X102

Type: 9-pin (socket)

PROFIBUS interface		
		
Pin no.	**Short designation**	**Meaning**
1-2	NC	Not connected
3	LTG_B	Data line (I/O)
4	RTS_AS	AS request to send (O)
5	GND	Ground electrically isolated
6	P5V_dp_fused	+5 V / max. 90 mA (fused) electrically isolated
7	NC	Not connected
8	LTG_A	Data line (I/O)
9	RTS_PG	PG request to send (O)

Installation/mounting

6

6.1 Installing the device

SIMOTION P320-4 is particularly suitable for installation in consoles, control cabinets and switchboards.

⚠ WARNING

Perform function test while installing the device in machines or plants

Following the results of a risk analysis, additional protection equipment on the machine or the system is necessary to avoid endangering persons. With this, especially the programming, configuration and wiring of the inserted I/O modules have to be executed, in accordance with the necessary risk analysis identified safety performance (SIL, PL or Cat.). The intended use of the device has to be secured.

The correct use of the device has to be verified with a function test on the system. This test can detect programming, configuration and wiring errors. The test results have to be documented and if necessary inserted into the relevant inputs.

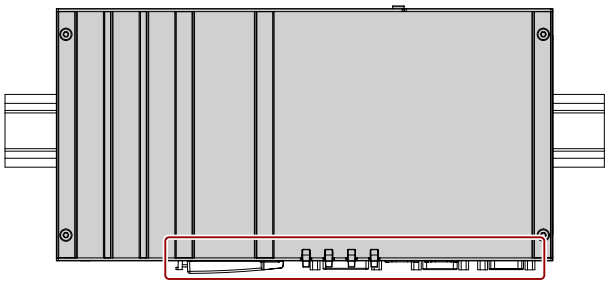
6.2 Permissible mounting positions

Note

The SIMOTION P320-4 is approved for operation in closed rooms only.

Ensure the required minimum clearance to other components or enclosure panels:

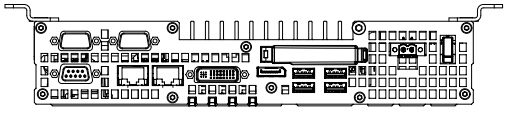
- Below at least 100 mm
- Above at least 50 mm



The permissible mounting positions for the SIMOTION P320-4 are standard rail mounting and vertical mounting.

Standard rail mounting

Horizontal mounting is the preferred position.

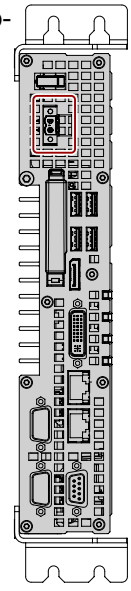


The following horizontal mounting option is permitted:

The interfaces are at the bottom.

The figure shows the interfaces on the front for representation purposes only.

For rail mounting, the interfaces always point downward.



You can find mounting information under Standard rail mounting (Page 97).

Vertical mounting

The following vertical mounting option is permitted:

The interfaces are at the front. The power supply connection is at the top.

You can find information on mounting under Vertical mounting (Page 98).

Ambient conditions

Observe the permissible temperature range for operation in the respective mounting position as described in Section "Technical data > Ambient conditions (Page 124)".

6.2.1 Standard rail mounting and vertical mounting

6.2.1.1 Standard rail mounting

Requirement

- Standard mounting rail, 35 mm standard profile
  The standard mounting rail is installed at the installation site.
- The standard mounting rail clip is attached to the SIMOTION P320-4.

Note

Ensure that the wall or ceiling can hold four times the total weight of the SIMOTION P320-4 including the standard mounting rail and additional expansion cards. See section Notes on installation (Page 99).

Mounting the standard mounting rail clip

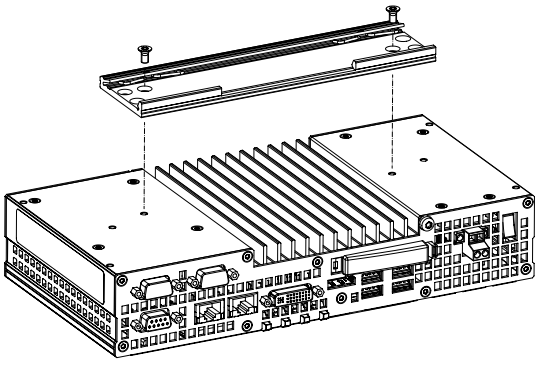
Before you can install the device on a standard mounting rail, you will need to attach the standard mounting rail clip included in the scope of delivery.

The fasteners and screws required are supplied with the device for mounting depending on the order number.

Requirement

- 1 standard mounting rail clip
- 2 screws
- 1 T20 screwdriver

Use the two screws to mount the standard mounting rail clip on the SIMOTION P320-4 enclosure.



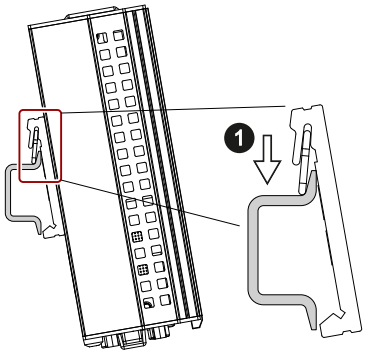


Figure 6-1 Mounting the standard mounting rail clip

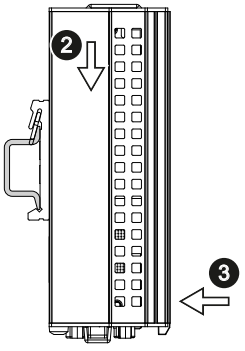


Mounting

1. Place the SIMOTION P320-4 and rail clip on the upper edge of the standard profile rail at the position shown.

2. Press the SIMOTION P320-4 slightly downward.
3. Once the rail clip slides over the bottom edge of the standard mounting rail, push the device onto the rail.

   Ensure that you hear the SIMOTION P320-4 snapping into place.

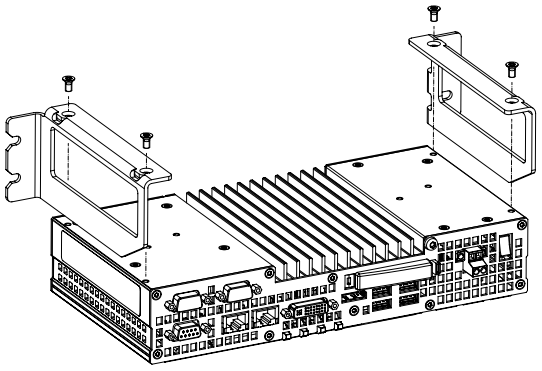
Note

To ensure secure vertical mounting on standard mounting rails, install a standard rail ground terminal beneath the device.

Removing

1. Press the SIMOTION P320-4 down until the rail clip releases the device.
2. Swing the SIMOTION P320-4 away from the standard mounting rail.
3. Lift the device up and off.

6.2.1.2 Vertical mounting



The fasteners and screws required are supplied with the device for the selected mounting option.

Requirement

- 2 mounting brackets
- 4 screws
- 1 T20 screwdriver

Procedure

1. Secure each mounting bracket with two screws.

6.3 Installation notes

Note the following:

- The SIMOTION P320-4 is approved for operation in closed rooms only.
- For installation in a control cabinet, observe the SIMATIC installation guidelines and applicable DIN/VDE requirements or other applicable country-specific regulations.
- When the device is used in the area of Industrial Control Equipment according to UL508, note that the device is classified as "Open Type". The installation of the device in a housing according to UL508 is therefore a mandatory requirement for approval or operation in according to UL508.

Securely fastening the SIMOTION P320-4

NOTICE
Insufficient load carrying capacity If the wall it is mounted on does not have a sufficient load-bearing capacity, the device may fall and be damaged. Ensure that the mounting surface on the wall can bear four times the total weight of the device, including fixing elements.

NOTICE
Incorrect fixing elements The device may not be securely fitted if you use dowels and screws other than those specified below for mounting. The device can fall and may be damaged. Use only the dowels and screws specified in the following table.

Connecting elements

The connecting elements for each mounting position are listed in the following:

- Standard rail mounting

Material	Bore diameter	Fastener
Metal, min. 2 mm thickness	5 mm	• 2 x M4 screws • 2 x M4 nuts
Concrete	6 mm, 40 mm depth	• 4 x dowels, ∅ 6 mm, 40 mm length • 4 x screws, ∅ 4 mm, 40 mm length
Plasterboard, min. 13 mm thickness	14 mm	4 x toggle bolts, ∅ 4 mm, 50 mm length

- Vertical mounting

Material	Bore diameter	Fastener
Concrete	6 mm, 40 mm depth	• 4 x dowels, ∅ 6 mm, 40 mm length • 4 x screws, ∅ 4 mm, 40 mm length
	8 mm, 40 mm depth	• Dowel, ∅ 8 mm, 40 mm length • Screw, ∅ 5 mm, 40 mm length
Plasterboard, min. 13 mm thickness	14 mm	Toggle bolt, ∅ 4 mm, 50 mm length

Mounting positions

The following mounting positions are permitted for the SIMOTION P320-4 and are described in detail in the following sections:

- Standard rail mounting (Page 95)
- Vertical mounting (Page 96)

6.4 Overview of operating modes for the SIMOTION P320-4

Overview

The following operating modes are available for mounting the SIMOTION P320-4.

The operating modes are:

- Decentralized structure
  The SIMOTION P320-4 is mounted separately from a panel in a decentralized structure.
- Headless operation
  The SIMOTION P320-4 is operated without panel.

Before mounting, the following must be noted:

Before you mount the SIMOTION P320-4 in a control cabinet or a rack, optional components are installed to expand the SIMOTION P320-4.

Example: installation of the optional IsoPROFIBUS board.

To do this, open the device and note the following procedure:

1. Open the cover of the SIMOTION P320-4.
2. Insert the optional IsoPROFIBUS board.
3. Plug in the SYNC I/O cable for synchronizing with PROFINET.
4. Close the cover.
5. Mount the SIMOTION P320-4.

Note

The installation and removal of components as well as the mounting of the SIMOTION P320-4 are described in detail in the SIMOTION P320-4 E / P320-4 S Commissioning and Hardware Installation Manual.

NOTICE
Avoid loss of warranty If you install or exchange system expansions and damage your device, the warranty becomes void.

6.5 Decentralized structure

Overview

The decentralized structure provides greater flexibility in terms of location and enables the SIMOTION P320-4 to be positioned in non-critical areas of the plant (e.g. control cabinet).

The decentralized structure of a panel with the SIMOTION P320-4 can be performed via the display port, USB or DVI connection. Please note the cable lengths that are supported for the panel.

For the use of an HMI system, the SIMATIC IFP, for example, can be connected by means of the described interfaces.

Connection

7

7.1 Requirements

General information

During the configuration of SIMOTION modules, you must pay attention to the "Electrical configuration design".

The following section provides information on wiring and networking the complete SIMOTION system.

Further information about the connection of the complete system and the individual components can be found in the SIMOTION P320-4 E / P320-4 S Commissioning and Hardware Installation Manual.

Open equipment

These modules are open equipment. This means they may only be installed in housings, cabinets, or in electrical equipment rooms that can only be entered or accessed with a key or tool. Housings, cabinets, or electrical equipment rooms may only be accessed by trained or authorized personnel. An external fire-protection housing is required.

Observe the following points during installation:

- The device should be connected only to **24 VDC** power supply networks that meet the requirements of **safety extra-low voltage** (**SELV**). The cable cross-section must be chosen large enough to ensure that no damage can result from cable overheating in the event of a short-circuit in the SIMOTION P320-4.
- Avoid extreme ambient conditions.
- Protect the device against dust, moisture, heat and severe vibration.
- Do not subject the SIMOTION P320-4 to direct sunlight.
- Install the device in such a way that it poses no danger, for example, by falling over.
- The clearance around the SIMOTION P320-4 must be at least 100 mm to ensure adequate ventilation.
- Do not cover the ventilation slots.

7.2 Overview of connections

The connection overview shows the SIMOTION P320-4 interfaces to which the appropriate I/O devices can be connected.

Note

The cabling for all elements and components of the complete system can only be carried out when disconnected from the mains.

It does not matter in which order connection takes place.

The connection of the individual components in the SIMOTION P320-4 E / P320-4 S Commissioning and Hardware Installation Manual.

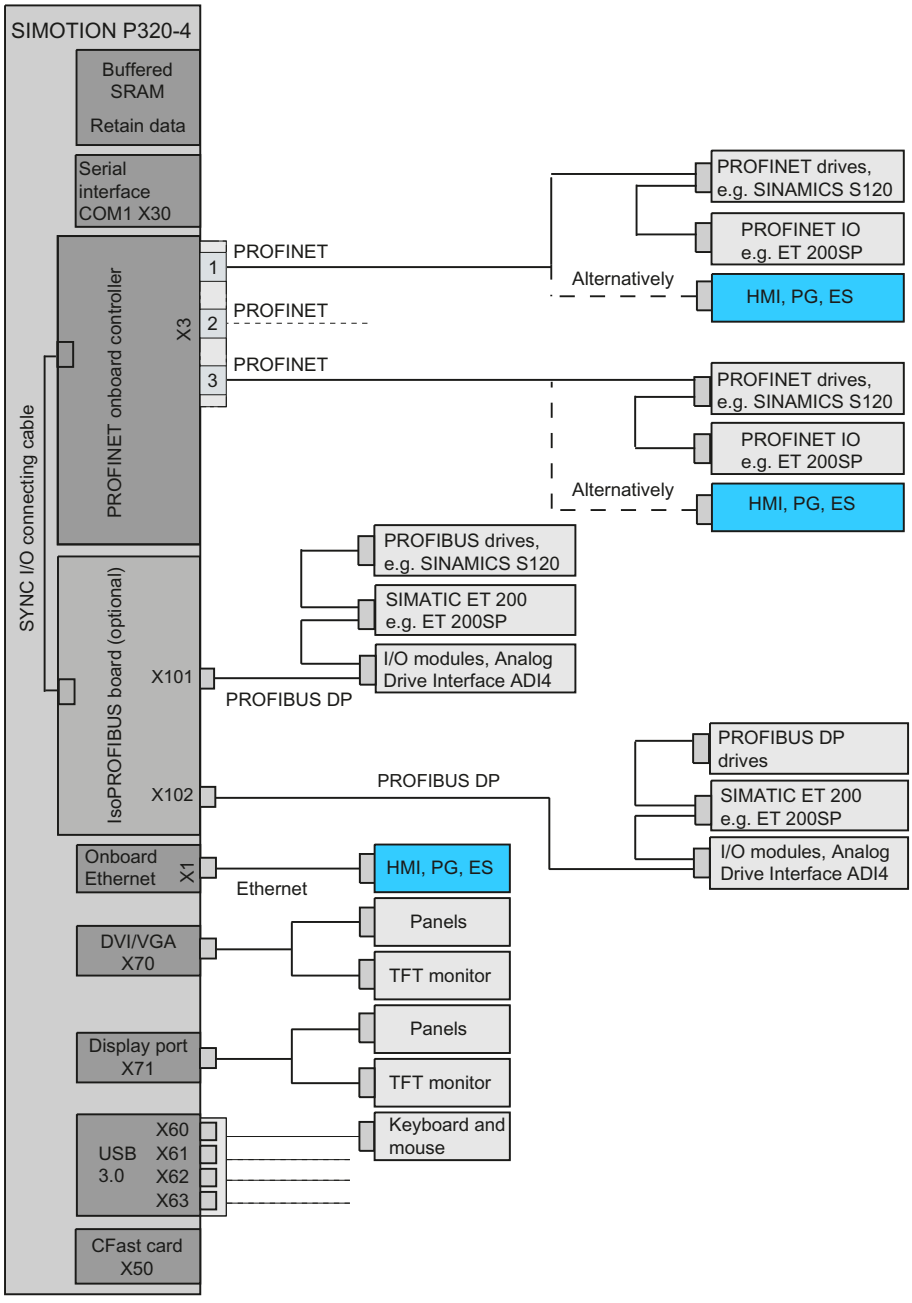


Figure 7-1 Hardware system overview - example with PROFINET onboard and optional IsoPROFIBUS board

7.3 Notes on connecting

⚠ WARNING

Risk of fire and electric shock

The On/Off switch does not isolate the device from the power supply. Risk of electric shock if the device is opened incorrectly or defective. There is also a risk of fire if the device or connecting lines are damaged.

You should therefore protect the device as follows:

- Always pull out the power plug when you are not using the device or if the device is defective. The power plug must be freely accessible.
- Connect the device to a protective conductor as instructed, see Section "Connecting the protective conductor".
- Use a central isolating switch in the case of cabinet installation.

⚠ WARNING

Risk of lightning strikes

A lightning strike may enter the mains cables and data transmission cables and reach to a person.

Death, serious injury and burns can be caused by lightning.

Take the following precautions:

- Disconnect the device from the power supply in good time when a thunderstorm is approaching.
- Do not touch mains cables and data transmission cables during a thunderstorm.
- Keep a sufficient distance from electric cables, distributors, systems, etc.

NOTICE

Fault caused by I/O devices

The connection of I/O devices can cause faults in the device.

The result may be personal injury and damage to the machine or plant.

Note the following when connecting I/O devices:

- Read the documentation of the I/O devices. Follow all instructions in the documentation.
- Only connect I/O devices which are approved for industrial applications in accordance with EN 61000-6-2 and IEC 61000-6-2.
- I/O devices that are not hotplug-capable may only be connected after the device has been disconnected from the power supply.

NOTICE

Damage through regenerative feedback

Regenerative feedback of voltage to ground by a connected or installed component can damage the device.

Connected or built-in I/Os, for example, a USB drive, are not permitted to supply any voltage to the device. Regenerative feedback is generally not permitted.

7.4 Protective conductor connection and potential equalization

The protective conductor connection is needed to protect the device and helps ensure that interference signals generated by power lines, signal lines or lines to I/O devices are safely discharged to earth.

The protective conductor connection on the device must be connected to the protective conductor of the control cabinet or system in which the device is installed.

⚠ WARNING

Electrical shock hazard and risk of fire

Internal components of a faulty device may carry dangerous voltages that pose the risk of fire or electrical shock. Risk of death and serious injury.

- Always connect the ground conductor before you commission the device.
- Never operate the device without protective conductor.
- Take a faulty device out of service immediately and mark it accordingly.

Requirement

- The device has been installed.
- 1 protective conductor, minimum cross section 2.5 mm^2
- 1 T20 screwdriver
- 1 x M4 cable lug

Procedure

1. Crimp the cable lug onto the protective conductor.
2. Screw the cable lug onto the protective conductor connection as shown.

① Protective conductor connection / potential equalization

3. Wire the protective conductor to the protective conductor connection of the control cabinet in which the device is installed.

7.5 Connecting peripheral equipment

Note

Observe suitability for industrial applications

Only connect I/O devices that are suitable for industrial applications in accordance with EN IEC 61000-6-2.

Note

I/O devices capable of hot-plugging (USB)

Hot-plug I/O devices (USB) may be connected while the PC is in operation.

NOTICE
Non-hot-plug I/O devices I/O devices that do not support hot-plugging may not be connected until the device is powered down. Strictly adhere to the specifications for peripheral equipment.

Note

Wait at least ten seconds before you reinsert USB devices.

Note that the EMC immunity of standard USB devices is designed only for office environments. These USB devices are appropriate for handling commissioning and service tasks. You may only use USB devices that are suitable for industrial applications. The USB devices are developed and marketed by the respective supplier. The respective product supplier provides support for the USB devices. The manufacturer's terms of liability shall apply.

Note

The connected or built-in I/Os, such as USB drives, should not introduce a counter EMF into the device.

Reverse voltages exceeding 0.5 V to ground that are generated by connected or installed components may prevent proper operation of the device or lead to its destruction.

7.6 Connecting the power supply (24 VDC)

Please note the following to ensure you operate the device safely and in accordance with regulations:

⚠ WARNING

Electrical shock hazard and risk of fire

Voltage exceeding SELV levels may cause fire or electric shock. Death or serious physical injury can result.

- Always wire the device to a 24 VDC power supply that is compliant with SELV requirements.
- You need a corresponding NEC Class 2 power source to comply with requirements to UL 50950-1 and UL 508 when operating the device on a wall, in an open frame, or at any other location.
- In all other cases (IEC / EN / DIN EN 60950-1), either a current source of limited output (LPS = Low Power Source), or a line-side fuse or a line-side circuit breaker is necessary. Current must be limited to 4.16 A. This requires a 4 A fuse max.

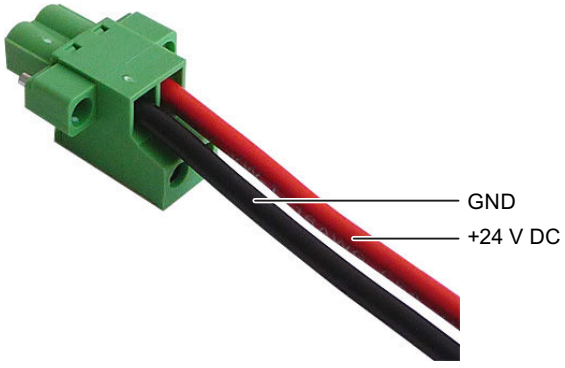
The device has reverse polarity protection.

Requirement

- The device has been installed.
- The protective conductor is connected.
- One wired terminal.
  The corresponding 24 VDC power supply is off.
- One 0.5 × 3 Philips screwdriver.

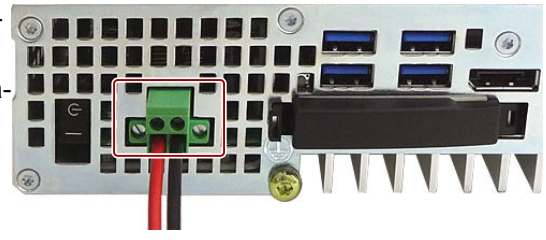
NOTICE
Damage to the device Do not turn the screws of the terminal when the terminal is inserted in the device. The device can be damaged through the pressure of the screwdriver on the terminal and consequently the connection socket. Only connect the wires to the terminal when it is unplugged.

Note



Make sure that the wires are not accidentally swapped over. Note the labeling for the contacts on the front cover of the device.

The terminal to connect the power supply is attached to the device. The terminal is designed for wires with a cross-section of 0.25 mm² to 2.5 mm². Only connect wires with a cross-section ≥ 0.5 mm².



Solid or flexible cables can be used for the connection. Ferrules are not required.

Procedure

1. Connect the cables as shown.
   Note the position of the terminal.

2. Insert the terminal at the marked position.
3. Secure the terminal using the integrated screws.

7.7 Connecting the device to networks

Ethernet can be used for integrating the device into existing or planned networks.

Ethernet

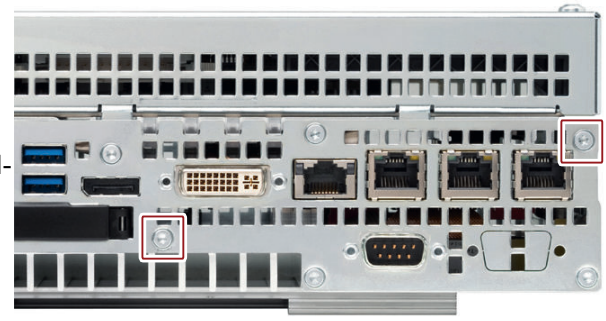
The integrated Ethernet interface can be used for communication and for data exchange with automation devices such as SIMOTION SCOUT, SIMATIC S7.

Further information

Further information is available on the Internet at the Siemens Industry Mall (www.siemens.com/industrymall), the catalog and ordering system for automation and drives.

7.8 Installing the strain relief

Strain relief for the device is provided in the scope of delivery. The strain relief is designed to prevent the lines connected to the device from being accidentally pulled out.



Attaching PROFINET strain relief

Requirement

- 1 strain relief
- 2 screws
- 1 T10 screwdriver

Mounting

1. Remove the marked countersunk screws.

2. Fasten the strain relief at the PROFINET interface(s).

   Use the oval head screws included with the strain relief.

Removing

Follow the mounting procedure in reverse to remove the strain relief.

Securing cables generally

Secure all cables connected to the device at the cable grip, each with a cable tie. The required cable ties are not part of the scope of delivery.

Requirement

- Maximum of 6 cable ties for USB, Ethernet, PROFIBUS
  Maximum cable tie width 3 mm.
- 1 cutting tool

Procedure

1. Place the cable tie around the attachment plate of the strain-relief assembly and secure the plugged-in cables.
2. Cut off the cable tie overhang.

Troubleshooting/FAQs

8

8.1 Error correction

This section provides you with tips on how to locate and troubleshoot common problems.

FAQs / error correction	Possible cause	Possible remedy
The device is not operational.	There is no power supply to the device.	• Check whether the 24 VDC power supply is connected. See Connecting the power supply (24 VDC) (Page 107). • Check whether the line side switch is activated. See Operator controls (Page 84).
SIMOTION P does not start after connecting the CFast card.	BIOS settings are not set to Hotplug Enabled.	You can find out how to check and correct the BIOS settings in Section Hotplug Enabled BIOS settings (Page 115).
SIMOTION P does not start after a reboot.	The user is not logged in automatically.	Set the password for the AutoLogin (Automatically Log On). See Section Changing the AutoLogin > SIMOTION P AutoLogin (Page 38).
The monitor remains dark.	The monitor is switched off.	Switch on the monitor.
	The monitor is in "power-save" mode.	Press any key on the connected keyboard.
	The brightness button has been set to dark.	Set the monitor brightness button to obtain more light. For detailed information, refer to the monitor operating instructions.
	The power cord or the monitor cable is not connected.	• Check whether the power cord has been properly connected to the monitor and to the system unit or to the grounded shockproof outlet. • Check whether the monitor cable has been properly connected to the system unit and to the monitor.
		If the monitor screen still remains dark after you have performed these checks, please contact your technical support team.
The mouse pointer does not appear on the screen.	The mouse driver is not loaded.	Check whether the mouse driver is properly installed and present when you start the application program. For more detailed information on the mouse driver, refer to the documentation for the mouse or application programs.
	The mouse is not connected.	Check whether the mouse is properly connected to the system unit. If you use an adapter or extension on the mouse cable, also check the connectors.
		If the cursor still does not appear on the screen after you have performed these checks and measures, please contact your technical support team.

FAQs / error correction	Possible cause	Possible remedy
Error message on the screen: Operating system not found	• No operating system present. • Incorrect active boot partition. • Incorrect drive entries in the SETUP.	Check whether one of the specified causes is present:
Wrong time and/or date on the PC.	-	• Press <ESC> during the boot sequence to open BIOS Setup. • Set the time and date in the setup menu.
Although the BIOS setting is OK, the time and date are still wrong.	The backup battery is empty.	Replace the backup battery. See SIMOTION P320-4 E / P320-4 S Commissioning and Hardware Installation Manual > Service and maintenances > Replacing the backup battery. If the problem cannot be resolved by replacing the battery, then contact your technical support team.
UPS does not function.	The operating system does not have a suitable driver for the UPS.	Install a suitable driver; the correct driver can often be downloaded from the homepage of the device's manufacturer. Note the SIMOTION P320-4 E / P320-4 S Commissioning and Hardware Installation Manual > Power on and software installation > Customer-specific software.
The display in the BIOS for the PROFINET MAC address is incorrect (00:00:00:00:00:00).	-	The correct MAC addresses can be taken from the rating plate on the housing. See also Device identification data (Page 76), Section MAC addresses.

8.2 Hotplug Enabled BIOS settings

Starting the BIOS setup

Proceed as follows:

1. Reset the SIMOTION P320-4 (warm or cold restart).
   Depending on the device version, the default settings may differ from the following figures.
2. After completing the startup test, you can start the program setup with BIOS.
   The following message is shown on the display:

Figure 8-1 SIEMENS Press Esc boot options

Press **Esc**.

3. After booting, the BIOS selection menu is displayed:

Figure 8-2 BIOS selection menu

4. The following buttons are available in the BIOS selection menu:

Button	Function
Continue	Exit BIOS menu, continue with the startup process
Boot Manager	Selection of the boot drive
Boot From File	Starting from a .EFI file
SCU	Device configurator (Setup Configuration Utility)
BIOS Update	BIOS update from USB stick
MEBx	Start the Intel Management Engine BIOS Extension

5. Select the **SCU** device configurator.

6. In the BIOS window, select the **Advanced** tab using the arrow keys and then select **IDE Configuration**.
   Press Enter to confirm the selection.

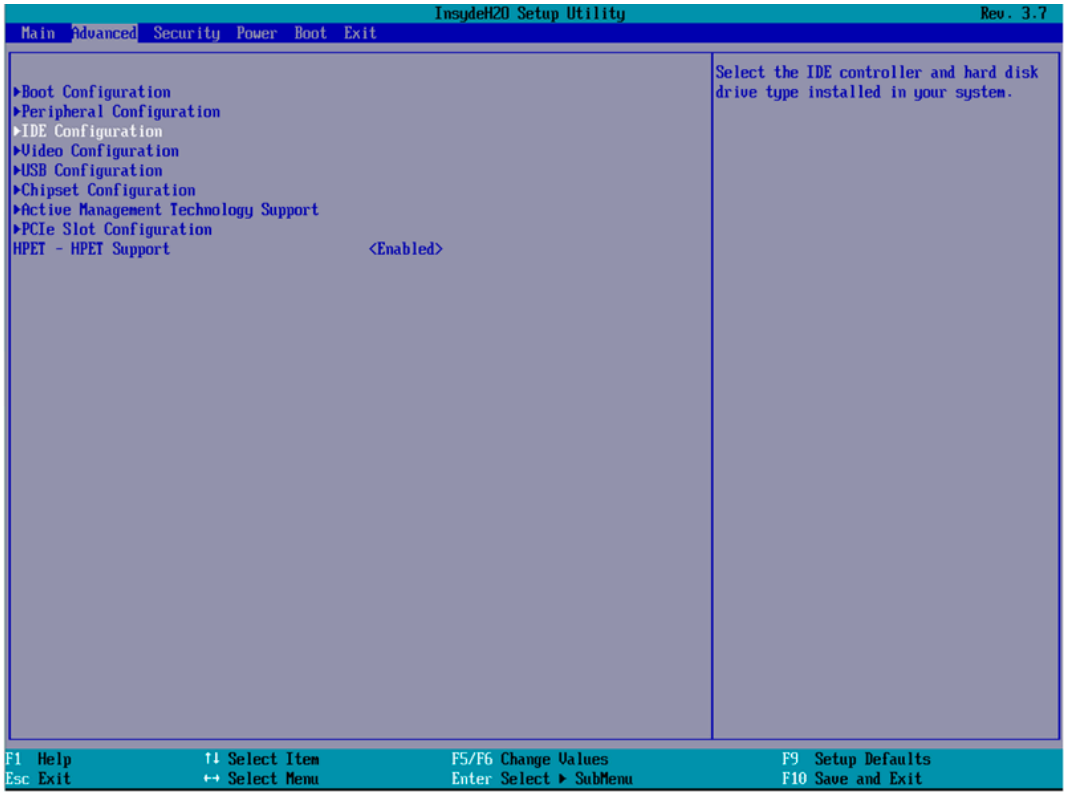


Figure 8-3 Advanced > IDE configuration

7. In the **IDE Configuration** window, select **SATA Port 2 HotPlug**.

8. Change the **Disabled** selection shown here to **Enabled**.

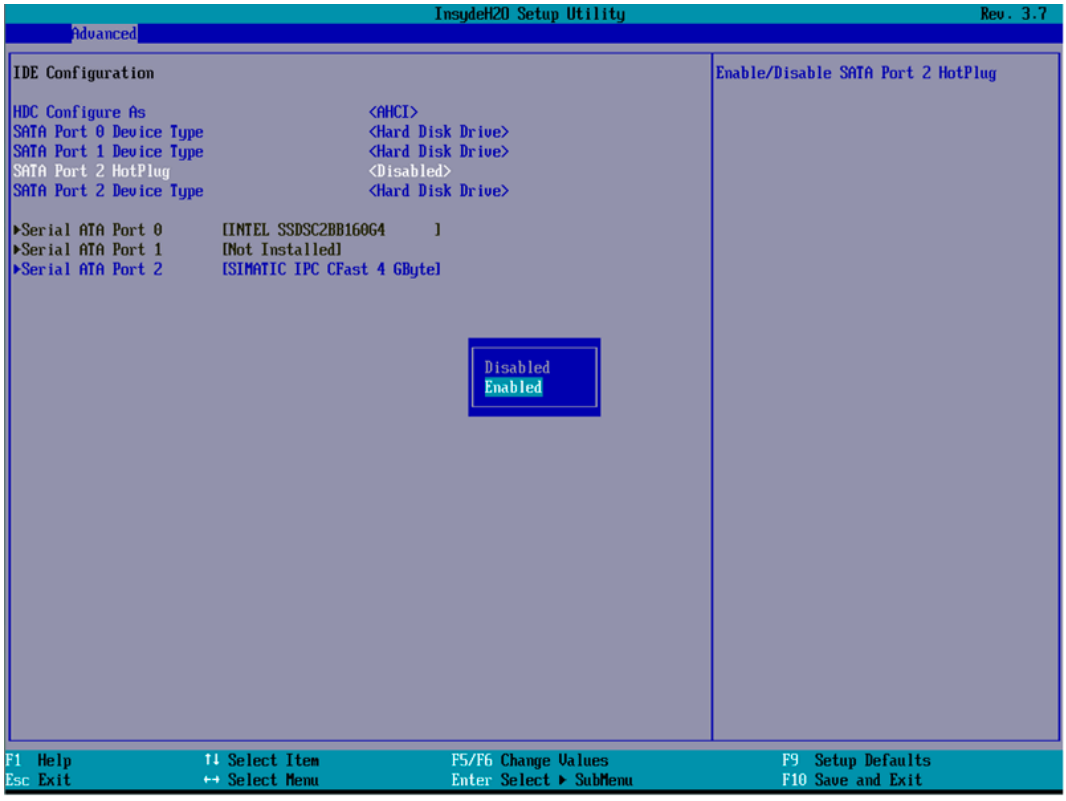

Figure 8-4 IDE Configuration > SATA Port 2 HotPlug

9. Press **F10** Save and Exit. The new entries are accepted.
10. Confirm the subsequent prompt to save the settings and exit the BIOS setup with **Yes**.

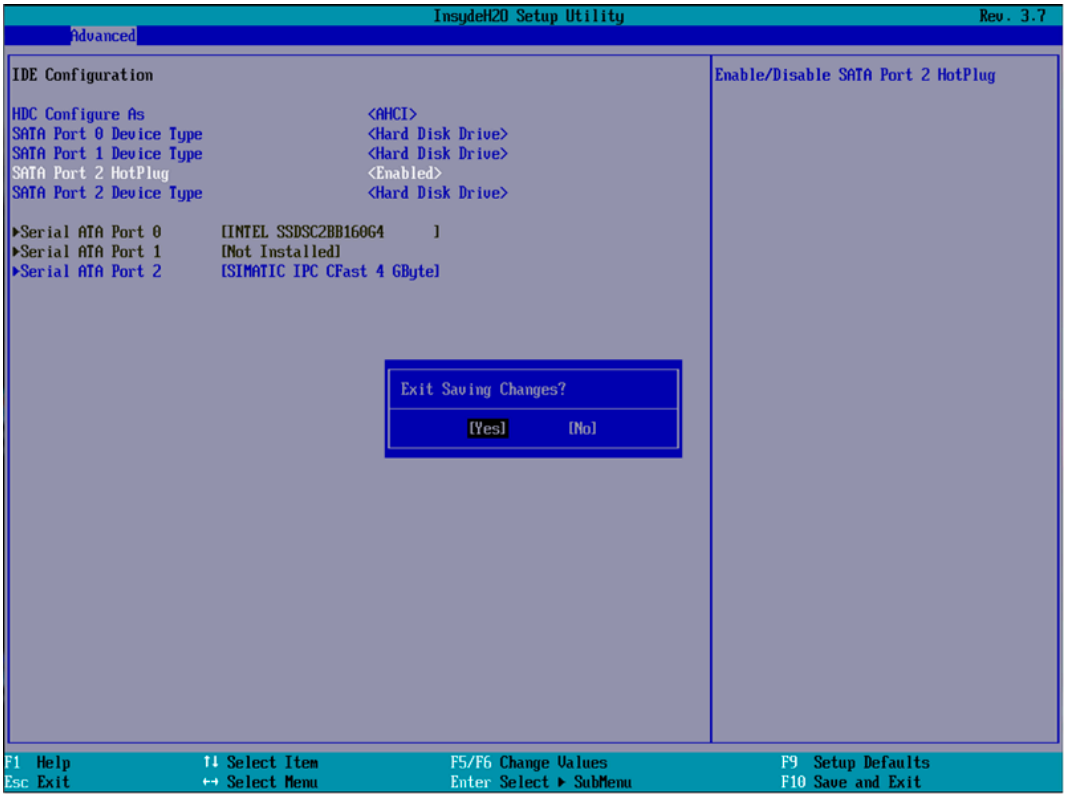

Figure 8-5 Confirming SATA Port 2 HotPlug > Enabled

Technical data

9

9.1 Overview of the technical specifications

Overview

The following technical specifications are available for SIMOTION P320-4 and the associated hardware components:

- General SIMOTION P320-4 technical specifications (Page 121)
- Ambient conditions (Page 124)
  - Climatic conditions
  - Mechanical conditions
- Technical specifications of the IsoPROFIBUS board (Page 125)
- Power requirement of the components (Page 126)
- Integrated DC voltage supply (Page 127)
- Technical specifications of the SITOP smart 24 V / 10 A (Page 127)
- Typical power consumption (Page 129)

9.2 General technical specifications

General technical specifications

General technical specifications for SIMOTION P320-4	
Article numbers	**SIMOTION P320-4 E** • 6AU1320-4DE65-3AF0 **SIMOTION P320-4 S** • 6AU1320-4DS66-3AG0
Dimensions	262 × 133 × 50.5 (W × H × D in mm)
Weight	Approximately 2 kg
Supply voltage (DC) [1]	24 VDC [1] (-20%/+20%)
Short-term voltage interruption in accordance with Namur	Min. 15 ms (at 20.4 V) Max. 10 events/h; recovery time min. 1 s
Max. power consumption	64.8 W (at 24 V)
Degree of protection	IP 20 according to IEC 60529
Protection class	Protection class I according to IEC 61140

General technical specifications for SIMOTION P320-4	
Safety regulations	EN 60950-1; UL 60950-1; UL 508;
Noise emission	<40dB (A) to DIN 45635-1
Quality assurance	In accordance with ISO 9001

[1] The upstream power supply must generate a safety extra-low voltage with safe electrical isolation according to IEC 60364-4-41 or an NEC Class 2 SELV and LPS according to IEC/ UL/EN/ DIN-EN 60950-1 (see the section "Connecting the power supply (24 V DC) (Page 107)").

Electromagnetic compatibility

Electromagnetic compatibility	
Interference emission	EN 61000-6-3, EN 61000-6-4, CISPR220 class B; FCC class A
Immunity with regard to conducted interference on the supply lines	± 2 kV according to IEC 61000-4-4; burst ± 1 kV according to IEC 61000-4-5; symmetrical surge ± 2 kV according to IEC 61000-4-5; asymmetrical surge
Noise immunity on signal lines	± 1 kV according to IEC 61000-4-4; burst; length < 3 m ± 2 kV according to IEC 61000-4-4; burst; length > 3 m ± 2 kV according to IEC 61000-4-5; surge; length > 30 m
Immunity to electrostatic discharge	± 6 kV contact discharge according to IEC 61000-4-2 ± 8 kV air discharge according to IEC 61000-4-2
Immunity to RF interference	10 V/m 80–1000 MHz and 1.4–2 GHz, 80% AM according to IEC 61000-4-3 1 V/m 2–2.7 GHz, 80% AM according to IEC 61000-4-3 10 V 10 kHz to 80 MHz, 80% AM according to IEC 61000-4-6
Immunity to magnetic fields	100 A/m, 50/60 Hz according to IEC 61000-4-8

Motherboard

Motherboard	
Processor	• Intel Core i3-3217UE 1.6 GHz, 3 MB SLC (SIMOTION P320-4 E) • Intel Core i7-3517UE 1.7 GHz, 4 MB SLC (SIMOTION P320-4 S)
Main memory	4 GB
Buffer memory	512 KB MRAM

Drive and memory media

Drive and memory media	
Solid State Disk (SSD)	≥ 80 GB Standard (SIMOTION P320-4 S)
CFast card	≥ 4 GB

Graphics

Graphics	
Graphics controller	Integrated Intel HD2000 or HD4000
Graphics memory	32 - 512 MB Shared Memory
Resolutions, frequencies, color depth	DVI-I: 640 × 480 to 1920 × 1200 / 60 Hz Display port: max. 1920 ×1200 / 60 Hz

Interfaces

Interfaces	
COM1	RS232, 115 kbps max., 9-pin SUB-D, male
DVI-I	Connection of display devices with DVI connector
Display port (DPP)	Connection of display devices with DPP connector
Keyboard	USB support
Mouse	USB support
USB	4 × USB 3.0
PROFINET	3 × RJ45 connector, onboard interface on ERTEC 400 basis, 100 Mbps electrically isolated
Ethernet	1 × Ethernet interface (RJ45) 10/100/1000 Mbps, electrically isolated, with teaming function

9.3 Ambient conditions

Climatic conditions

Temperature	Tested according to IEC 60068-2-1, IEC 60068-2-2, IEC 60068-2-14
- During operation	**Standard rail mounting (preferred mounting position)**:
	Operation with CFast card and/or SSD: • With max. 1 expansion card (max. load 10 W): 0 to +40° C • With max. 1 expansion card (max. load 10 W) in RAL [2]: 0 to +50° C [1] Operation with CFast card: • Without expansion cards in RAL [2]: 0 to +55° C [1]
	Vertical mounting:
	Operation with CFast card and/or SSD: • Without expansion cards: 0 to +40° C Operation with SSD: • With max. 1 expansion card (max. load 10 W) in RAL [2]: 0 to +45° C [1] Operation with CFast card: • Without expansion cards in RAL [2]: 0 to +50° C [1] • With max. 1 expansion card (max. load 10 W): 0 to +40° C • With max. 1 expansion card (max. load 10 W) in RAL [2]: 0 to +50° C [1]
- During storage/shipping	-40 °C to +70 °C (for devices with CFast or SSD)
- Gradient	Operating mode: Max. 10° C/h; Storage: 20° C/h; no condensation
Relative humidity	Tested according to IEC 60068-2-78, IEC 60068-2-30
- During operation	5% to 80% at 25° C (no condensation)
- During storage/shipping	5% to 95% at 25° C (no condensation)
Air pressure	
- During operation	1080 to 795 hPa (corresponds to an altitude of -1000 m to 2000 m)
- During storage/shipping	1080 to 660 hPa (corresponds to an altitude of -1000 m to 3500 m)

[1] For P320-4 S you must set "Turbo Mode Level" to "Temperature optimized" in the "Power" menu, selection "Advanced CPU Control", of the BIOS Setup; otherwise you have to reduce the maximum ambient temperature by 5 °C.

[2] RAL = Restricted Access Location
Installation of device in operating facilities with restricted access, for example, a locked control cabinet.

Mechanical conditions

Vibration	Tested according to DIN IEC 60068-2-6
- During operation	With CFast card or SSD: 5 to 9 Hz: 3.5 mm 9 to 500 Hz: 9.8 m/s2
- During storage/shipping	5 to 9 Hz: 3.5 mm 9 to 500 Hz: 9.8 m/s2
Resistance to shock	Tested according to DIN IEC 60068-2-27
- During storage/shipping	250 m/s^2, 6 ms

9.4 Technical data of the IsoPROFIBUS board

Technical specifications of the IsoPROFIBUS board (optional)

Table 9-1

IsoPROFIBUS board		
Power consumption for + 5 V PCI voltage		
Standard	2.5 W	
Maximum	3.5 W	
Permissible ambient conditions		
Heat dissipation	Open circuit ventilation	
Temperature	**Operation**	**Storage/transport**
• IsoPROFIBUS board in the SIMOTION P320-4	5° C to 45° C	-20° C to 60° C
Tested according to	EN 60068-2-1, EN 60068-2-2, EN 60068-2-14	
Relative atmospheric humidity	**Operation**	**Storage/transport**
• IsoPROFIBUS board in the SIMOTION P320-4	5 % … 80 %	5 % … 95 %
Tested according to	EN 60068-2-30	
Temperature change	Max. 10 K per hour in operation	
Moisture condensation and ice formation	Not permissible	
Design		
Module	Card (3.3 V/5 V, 32 bits)	
Dimensions (H x D) in mm	107 x 170	
Weight	150 g	
Space requirements	Short PCI slot	

Safety

Safety	
Degree of protection	IP20 in mounted state
Protection class	I complies with VDE 0106
Safety regulations	EN 60950
Approvals	CE, UL508, cULus

Quality assurance

Quality assurance complies with ISO 9001.

Note

The safety regulations, approvals, protection type and protection class specified are valid only if the module is inserted in a SIMOTION P320-4.

9.5 Power requirements of the components

Maximum power consumption of the auxiliary components

Auxiliary components		Maximum permitted power consumption			Max. total power
		+5 V	+3.3 V	+12 V	
USB device	High current	900 mA	-	-	10 W (for all USB devices)
Display port		-	500 mA	-	
DVI-I		500 mA	-	-	
PROFIBUS		500 mA	-	-	
PCI modules	Per slot	-	1.5 A	0.5 A	10 W (for entire device)
	Total	-	2 A	1 A	

[1] The total power of the PCI and USB cards may not exceed 15 W

Note

Device can overheat!

To avoid overheating, the power loss per PCI slot should not exceed 5 watts.

9.6 Integrated DC power supply

Technical specifications

DC power supply	
Input voltage	24 V DC (-20%/+20%)
Power consumption [1]	Max. 90 W
Power failure buffering	hold-up time = 20 ms at 20.4 V (DC_FAIL is active after > 5 ms)
Maximum continuous output power [1]	80 W
Degree of protection	IP 20
Protection class	Protection class I (a protective conductor must be connected to the device)

[1] The power specifications apply to the power supply component not to the device.

Note

Inrush current

The device requires an inrush current of at least 6.5 A for 50 ms.

The peak value of the startup current depends on the input voltage and the impedance of the 24 V power source. Peak currents greater than 6.5 A are possible. This will not have a negative impact on device functionality.

9.7 Technical data for the SITOP smart 24 V/10 A

Table 9-2 Technical specifications for the SITOP smart 24 V / 10 A

SITOP smart 24 V/10 A	
Input data	
Input voltage rated value	120/230 VAC
Input voltage range	85 to 132 VAC / 170 to 264 VAC
Power failure bridging	> 20 ms at V_{in} = 93/187 V
Mains frequency rated value	50/60 Hz
Mains frequency range	47 … 63 Hz
Input current rated value	4.1/2.4 A
Switch-on current (at +25° C)	< 65 A
Recommended miniature circuit breaker	10 A, Characteristic C
Output data	
Output voltage rated value	24 VDC
Output voltage tolerance	± 3 %
Residual ripple/spikes	< 150/240 mV_{pp}
Output voltage adjustment range	22.8 to 28 VDC

SITOP smart 24 V/10 A	
Output current rated value	10 A (12 A up to +45° C)
Efficiency	Typ. 90%
Electronic short-circuit protection	Yes; constant current approx. 1.3 × output current rated value; for 5 seconds extra power at 1.5 × output current rated value
Ambient conditions	
Ambient temperature during storage and transport	-40° … +85° C
Ambient temperature during operation	0° … +60° C
Humidity class	Climate class 3K3 according to EN 60721; relative atmospheric humidity 5 to 95%; no condensation
Degree of protection (EN 60529)	IP20
Radio suppression level (EN 55022)	Class B
Line harmonic limitation according to EN 61000-3-2	No
EMC immunity	EN 61000-6-2; EN 61000-4-2/-3/-4/-5/-6/-11
EMC interference emission	EN 61000-6-4
Safety	
Safety class (IEC 536; VDE 1006 T1)	Class I
Primary/secondary galvanic isolation	SELV output voltage according to EN 60950 and EN 50178; transformer according to EN 61558-2-17; overvoltage protection in the event of an internal error U_a < 60 V
Dimensions and weight	
Dimensions (W x H x D) in mm	70 x 125 x 125
Weight	Approximately. 0.75 kg
Certifications and approvals	
CE	CE conformity according to 98/336 EEC and 73/23 EEC
UL/CSA	UL 508 (Listed, File E197259); CSA C22.2 No 14, No 60950-1-03
Shipbuilding	Germanischer Lloyd
Directive 94/9/EC	Declaration of conformity according to EN 60079-15: ATEX94/9/EC Cat.3;Eex, nA, II, T4 U
C-Tick	AS/NZS 2064:1997
Article numbers	
	6EP1334-2AA01, 6EP1334-2BA01

9.8 Typical power consumption

Technical specifications

Typical current and power consumption of the device at a rated voltage of 24 V

Description	Current consumption	Power consumption
Device with core i3 or core i7 processor	950 mA	23 W
Fieldbus (PROFINET)	120 mA	3 W
USB expansion [1]	Max. 500 mA	Max. 12 W
PCI expansion [1]	Max. 500 mA	Max. 12 W

[1] The total power of the PCI and USB expansion may not exceed 15 W

Dimension drawings

10

10.1 Overview of the dimensional drawings

This section contains the dimension drawings for the SIMOTION P320-4:

- Standard rail mounting (Page 131)
- Vertical mounting (Page 133)
- SIMOTION P320-4 with an expansion card (Page 135)

10.2 Device dimension drawing for standard rail mounting

Various views of the standard rail mounting with dimensions are shown in the following:

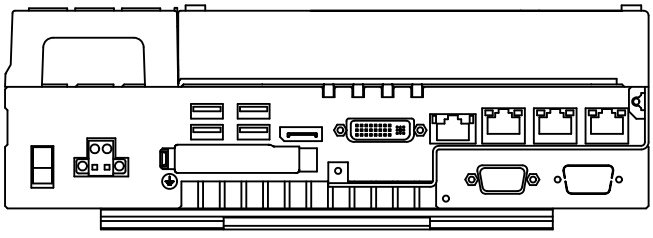

Figure 10-1 Standard rail mounting, bottom view

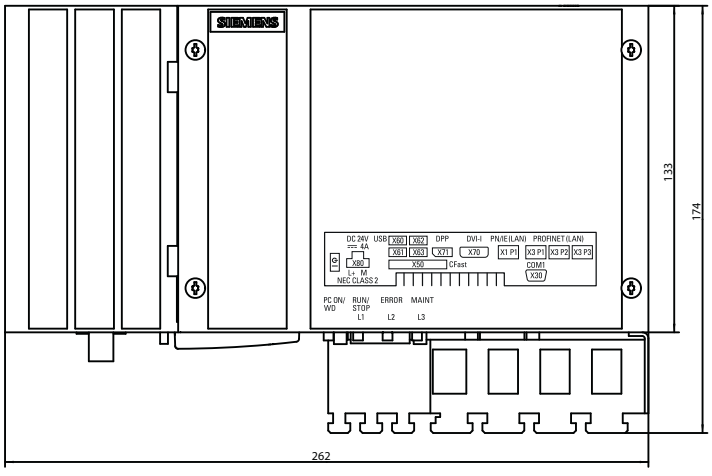

Figure 10-2 Standard rail mounting, front view

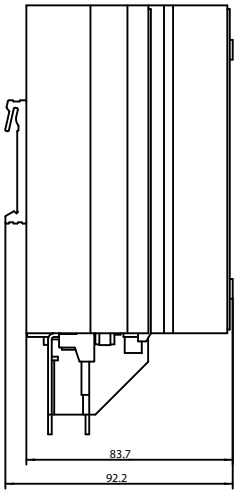

Figure 10-3 Standard rail mounting, side left view

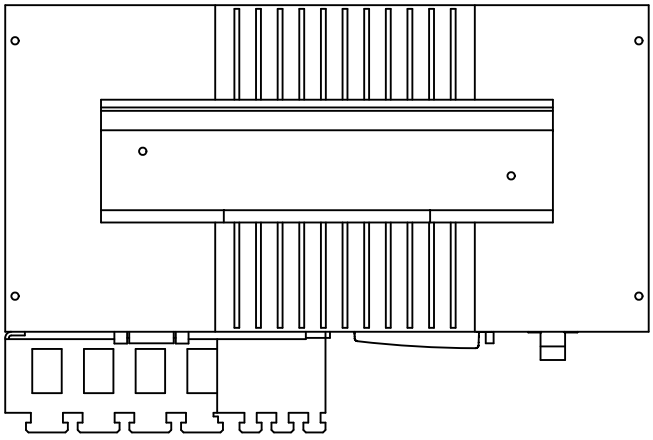

Figure 10-4 Standard rail mounting, rear view

All dimensions in mm.

10.3 Device dimension drawing for vertical mounting

Various views of the vertical mounting with dimensions are shown in the following:

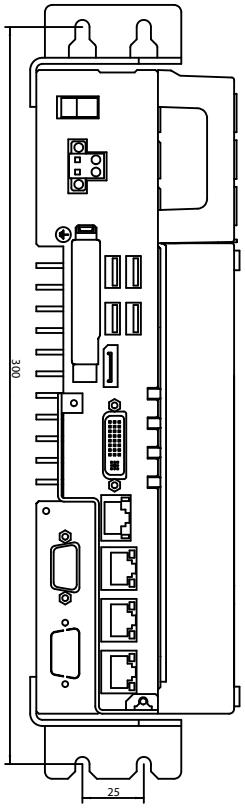

Figure 10-5 Vertical mounting, front view

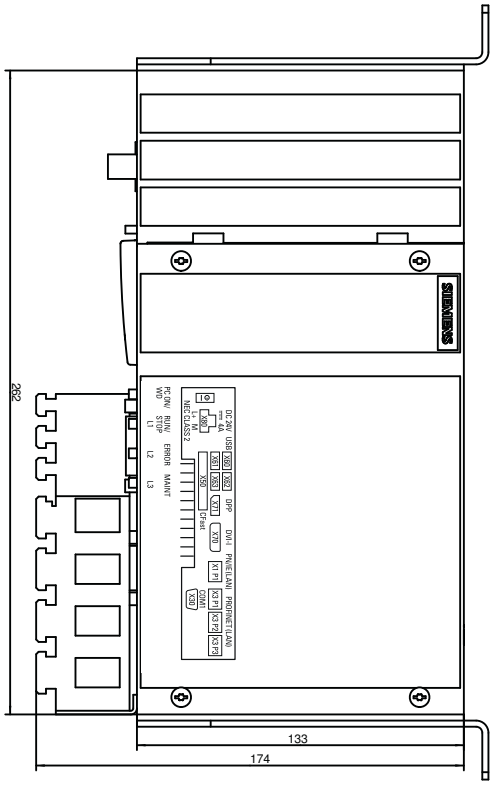

Figure 10-6 Vertical mounting, front side view

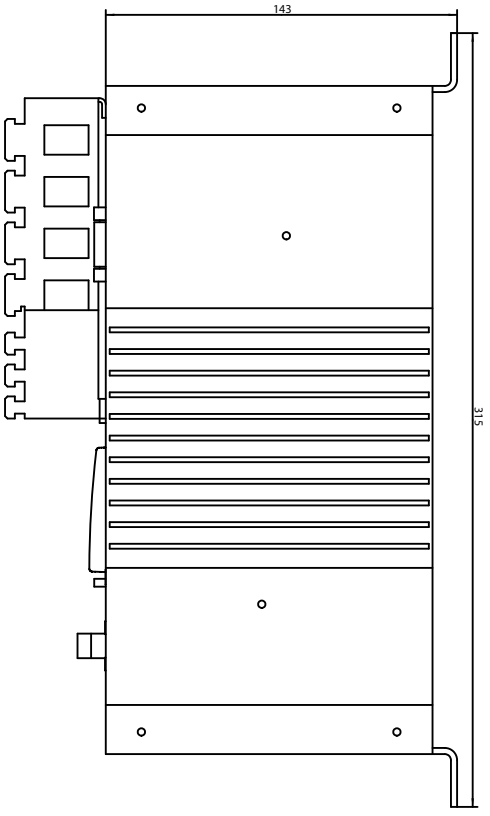

Figure 10-7 Vertical mounting, rear side view

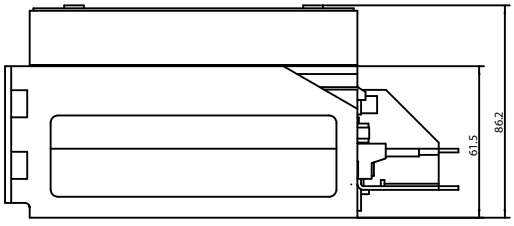

Figure 10-8 Vertical mounting, view from above

All dimensions in mm.

Spare parts

11

11.1 Available spare parts for SIMOTION P320-4

You can order the accessories via the Siemens Industry Mall (www.siemens.com/industrymall).

The following spare parts are available for SIMOTION P320-4:

Spare parts for SIMOTION P320-4			
Spare parts	**Article number**	**Scope of delivery**	**Accessories**
Lithium battery	A5E30314053	x	x
External CFast card The external CFast card contains user data. If a CFast card is used as a replacement for the external memory card, **no** Restore DVD or image is necessary.	6ES7648-2BF10-0XG0	x	x
IsoPROFIBUS board	6AU1390-0AA00-0AA1	-	x

Spares On Web

Spares On Web (http://support.automation.siemens.com/WW/view/en/16612315) is an information system that enables you to find out which spare parts are available for your device.

Standards and approvals

A

A.1 General rules

CE marking

CE	Our products satisfy the requirements and protection objectives of the EC Directives and comply with the harmonized European standards (EN).

Electromagnetic compatibility

Standards for EMC are satisfied if the EMC Installation Guideline is observed.

SIMOTION products are designed for industrial use in accordance with product standard DIN EN 61800-3, Category C2.

cULus approval

c UL us	Listed component mark for United States and the Canada Underwriters Laboratories (UL) according to Standard UL 508, File E164110, File E115352, File E85972.

You can find further information on the respective device on the Internet at http://database.ul.com/cgi-bin/XYV/template/LISEXT/1FRAME/index.htm Enter the first seven characters of the article number at **Keyword**. Then click **Search**.

Korea certification

KC	KC registration number: KCC-REM-S49-SIMOTION Note that this device complies with limit class A with regard to the emission of radio frequency interference. This device can be used in all areas except residential areas. 이 기기는 업무용(A급) 전자파적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정외의 지역에서 사용하는 것을 목적으로 합니다.

Declaration of conformity

The current Declaration of conformity is available on the Internet at Declaration of conformity (http://support.automation.siemens.com/WW/view/en/10805446/134200).

ESD Guideline

B

B.1 ESD definition

What does ESD mean?

Electrostatic sensitive devices (ESDs) are individual components, integrated circuits, modules or devices that may be damaged by either electrostatic fields or electrostatic discharge.

NOTICE

Damage caused by electric fields or electrostatic discharge

Electric fields or electrostatic discharge can result in malfunctions as a result of damaged individual parts, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber or aluminum foil.
- Only touch components, modules and devices if you are first grounded by applying one of the following measures:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

B.2 Electrostatic charging of individuals

Any person who is not conductively connected to the electrical potential of the environment can accumulate an electrostatic charge.

This figure indicates the maximum electrostatic charges that can accumulate on an operator when he comes into contact with the indicated materials. These values comply with the specifications in IEC 801-2.

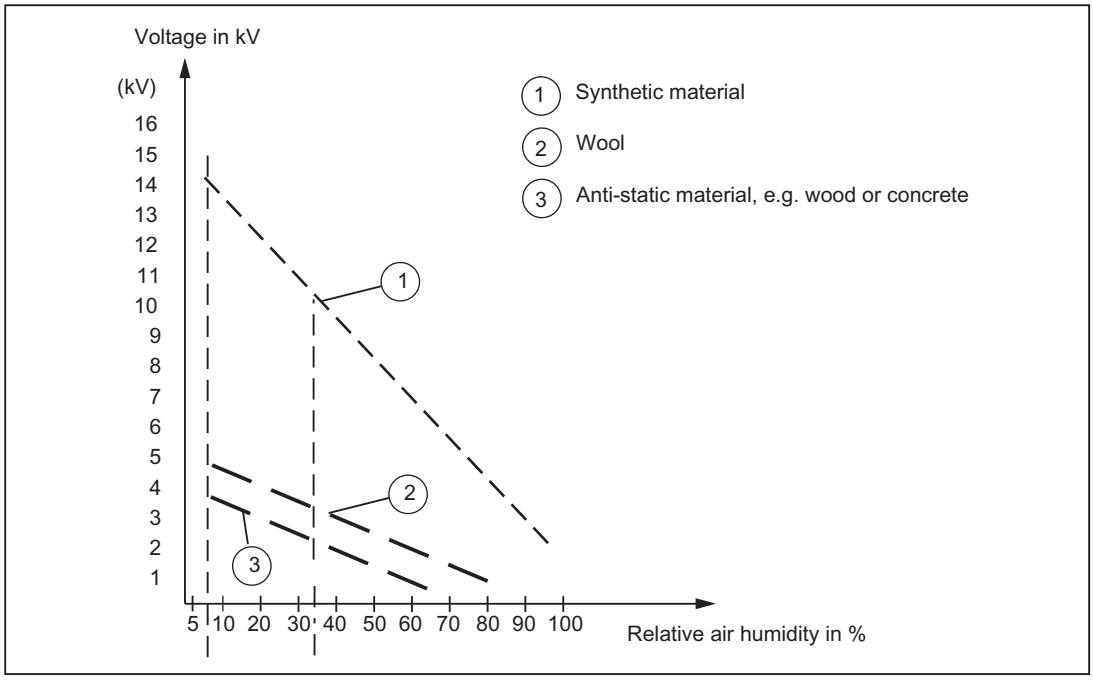

Figure B-1 Electrostatic voltage that can accumulate on operating personnel

B.3 Basic measures for protection against discharge of static electricity

Ensure sufficient grounding

When working with electrostatic sensitive devices, make sure that the you, your workstation, and the packaging are properly grounded. This prevents the accumulation of static electricity.

Avoid direct contact

You should only touch ESD components if unavoidable (for example, during maintenance work). When you touch modules, make sure that you do not touch either the pins on the modules or the printed conductors. If you follow these instructions, electrostatic discharge cannot reach or damage sensitive components.

If you have to take measurements on a module, make sure that you first discharge any static that may have accumulated in your body. To do this, touch a grounded metal object. Only use grounded measuring instruments.

1 Introduction

1.1 About this Document

This document is part of the documentation for the Base Load Power Hub (BLPH) Project (K559-2254). In case of any contradiction resulting by the information or specification given in this document, phase 2 or later documents supersede the information provided in this document.

1.2 Other Applicable Documents

The following documents are applicable:

1.3 Generic Terms and Abbreviations Used

This following list should help you understand some of the abbreviations used in this document.

Generic Term and Abbreviation	Description
BESS	Battery Energy Storage System
BLPH	Base Load Power Hub
PCS	Power Conversion System

Table 2: Generic terms and abbreviations used

2 General

There are no complex/advanced control loops within the FREQCON system, therefore this document is not required according to KBR feedback to this document.

SPECIFICATION

TERMINAL STRIP

-XE1	MAIN POWER SUPPLY 600V AC
-XE2	DC POWER SUPPLY 1000V DC
-XE	MAIN POWER SUPPLY 400V AC
-X1	MAIN POWER 400V/230V AC
-X2	LIGHT CABINET 230V AC
-X3	CONTROL VOLTAGE 24V DC
-14X1	CONTROL VOLTAGE 24V DC (TO DC CONTACTORS)
-X5	LOW-VOLTAGE SIGNALS
-XDC0	24V DC POWER SUPPLY
-XDC1-4	CONTROL VOLTAGE 24V DC (UPS)
-XT	TRANSFER TERMINAL BLOCK 24V DC / 230V AC

WIRING COLOR

L1 / L2 / L3	=	BLACK
N	=	LIGHT BLUE (IEC) / GREY (UL)
PE	=	YELLOW-GREEN
EXTERNAL VOLTAGE	=	ORANGE
CONTROL VOLTAGE 24 V DC	=	DARK BLUE
ANALOG SIGNALS	=	WHITE

PLACE

+CTRL	=	Control cabinet
+CON	=	Converter cabinet
+IND	=	Inductor cabinet
+CIR	=	Circuit breaker cabinet
+COSY	=	Cooling System
+FAN	=	External fan

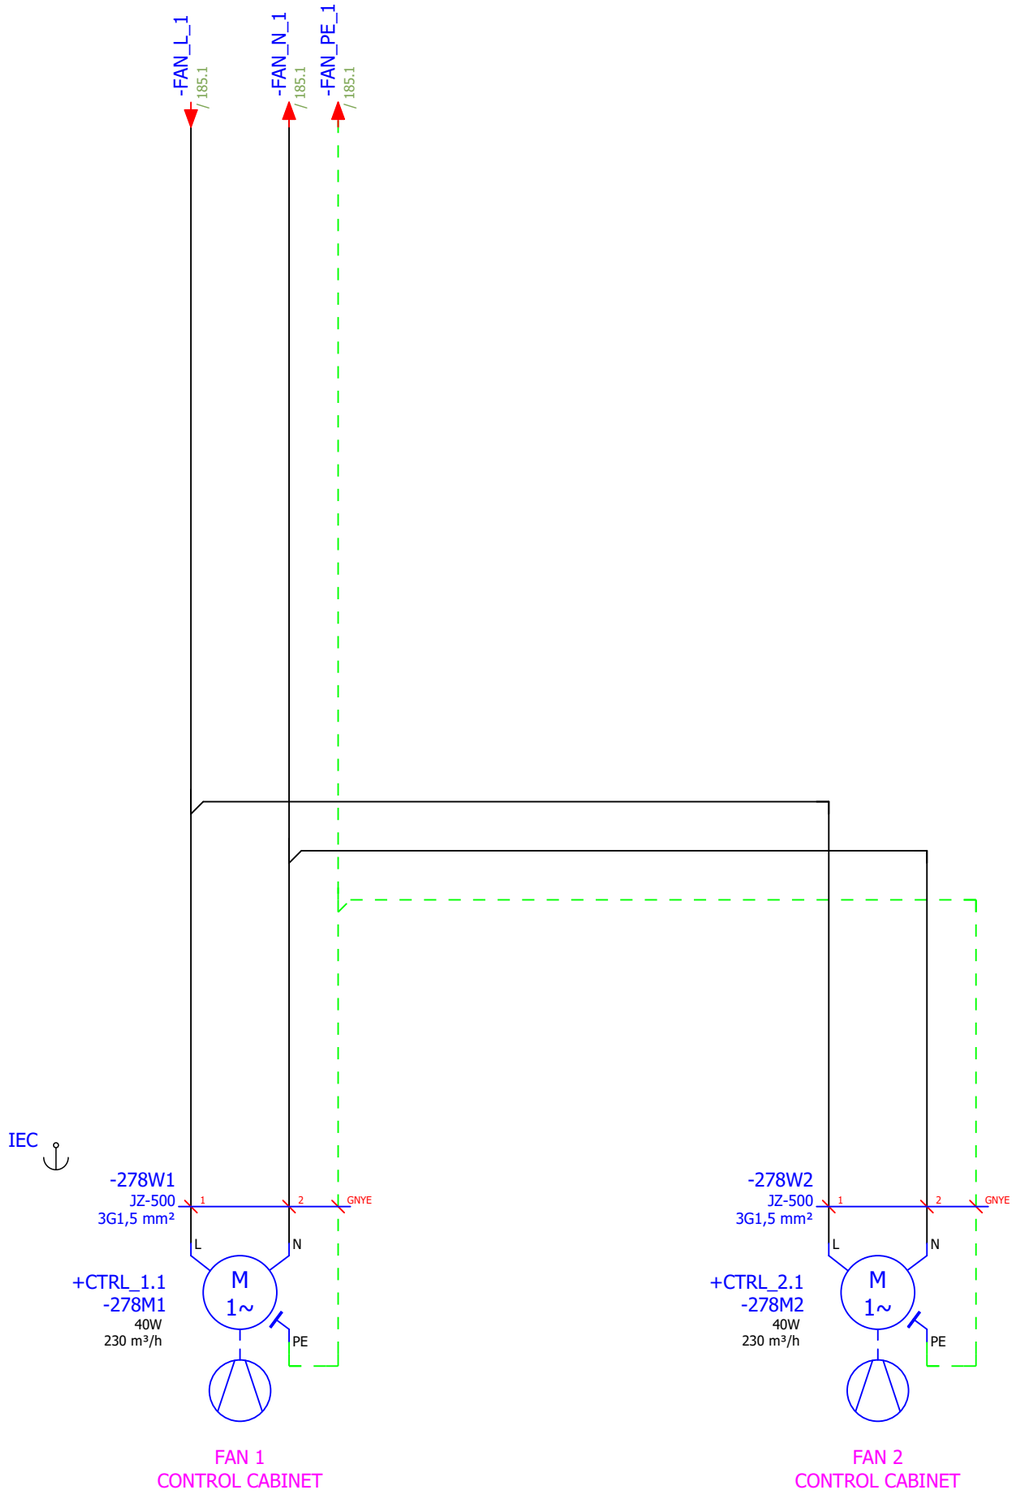
SHUTDOWN CIRCUIT BREAKERS / DC CONTACTORS

FAULT SIGNAL SAFETY RELAY



If the safety relais triggers or a failure is detected, then is the feedback "true".

Note:
The feedback circuit monitors the positions of the positive-guided NC contacts on the contactors 195K1 and 195K2. If one of their contacts latsches, then it is not possible to switch the contactors back on.

1 Introduction

1.1 About this Document

This document is part of the documentation for the Base Load Power Hub (BLPH) Project (K559-2254). In case of any contradiction resulting by the information or specification given in this document, later documents supersede the information provided in this document.

1.2 Display Elements

Symbol	Meaning
➜	Action with one or several steps for which the sequence is irrelevant.
Step 1 : **Step 2 :**	Action with several steps for which the sequence is relevant.
•	First level of list.
-	Second level of list.

Table 1: Display Elements

1.3 Other Applicable Documents

The following documents are applicable:

Document type	Document Name
Extract of BESS and PCS circuit diagram (Cable schedule PCS)	10354_23A2007_CAE_Statron_Shell Crosswind BESS FQ 1MW 5MWh Offshore_Cable Schedule PCS
Extract of BESS and PCS circuit diagram (Cable schedule Battery 1)	10354_23A2007_CAE_Statron_Shell Crosswind BESS FQ 1MW 5MWh Offshore_Cable Schedule Battery 1
Extract of BESS and PCS circuit diagram (Cable schedule Battery 2)	10354_23A2007_CAE_Statron_Shell Crosswind BESS FQ 1MW 5MWh Offshore_Cable Schedule Battery 2

1.4 Generic Terms and Abbreviations Used

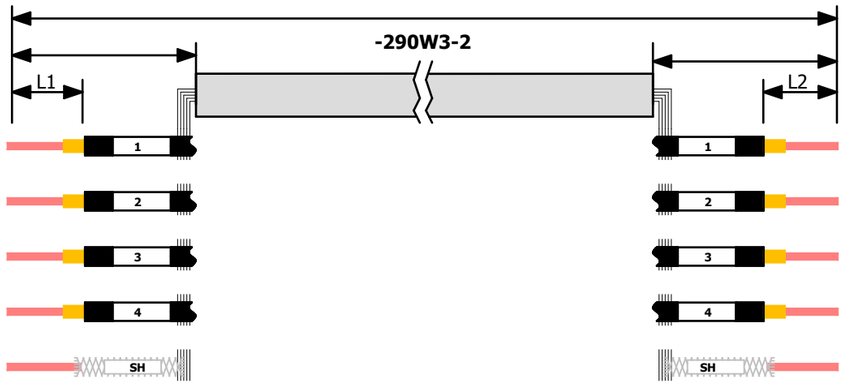
This following list should help you understand some of the abbreviations used in this document.

Generic Term and Abbreviation	Description
BESS	Battery Energy Storage System
BLPH	Base Load Power Hub
PCS	Power Conversion System

Table 2: Generic terms and abbreviations used

2 General

The cable schedules of the PCS and BESS containers are part of the circuit diagram of the complete system attached to this document (*see section 1.3 "Other Applicable Documents"*). The relevant pages are extracted into separate files as shown in the following table.



Container	Document Name
PCS	10354_23A2007_CAE_Statron_Shell Crosswind BESS FQ 1MW 5MWh Offshore_Cable Schedule PCS
Battery 1	10354_23A2007_CAE_Statron_Shell Crosswind BESS FQ 1MW 5MWh Offshore_Cable Schedule Battery 1
Battery 2	10354_23A2007_CAE_Statron_Shell Crosswind BESS FQ 1MW 5MWh Offshore_Cable Schedule Battery 2

3 Appendix

1. 10354_23A2007_CAE_Statron_Shell Crosswind BESS FQ 1MW 5MWh Offshore_Cable Schedule PCS
2. 10354_23A2007_CAE_Statron_Shell Crosswind BESS FQ 1MW 5MWh Offshore_Cable Schedule Battery 1
3. 10354_23A2007_CAE_Statron_Shell Crosswind BESS FQ 1MW 5MWh Offshore_Cable Schedule Battery 2

Original document

This document is an original document of FREQCON GmbH.

1 Introduction

1.1 About this Document

This document provides a brief list of main auxiliary loads in the BESS FQ system. A comprehensive list of auxiliary loads and the distribution of power supply shall be provided end of detailed engineering phase.

This document is part of project phase “Detailed Design Engineering” for the Base Load Power Hub (BLPH) Project (K559-2254). In case of any contradiction resulting by the information or specification given in this document, phase 2 or later documents supersede the information provided in this document.

Table 1: Display Elements

1.3 Other Applicable Documents

The following documents are applicable:

Document type	Document Name

Table 2: Other applicable documents

1.4 Generic Terms and Abbreviations Used

This following list should help you understand some of the abbreviations used in this document.

Generic Term and Abbreviation	Description
BESS	Battery Energy Storage System
BLPH	Base Load Power Hub
PCS	Power Conversion System

Table 3: Generic terms and abbreviations used

2 Main Auxiliary Loads

2.1 PCS Container

In the PCS container, the main auxiliary loads include (but not limited to):

- Control cabinet
- Water pump and distribution system
- Water heating element
- Water to air heat exchanger
- HVAC air cooling units for PCS (and transformer)
- Power supply inside container
- Several small components (e.g. fans for cabinets, lighting inside container, remote access router etc.)

2.2 Battery Storage Container

In the battery storage container(s), the main auxiliary loads include (but not limited to):

- BMS and communication ICs (including cabinet controller, CMC, measurements etc.)
- CO sensors, smoke sensors
- HVAC air cooling units
- External fire alarm (if required)
- External forced ventilation / exhaust fans (if required)
- Several small components (e.g. fans for cabinets, lighting inside container etc.)

1. Please provide Table based list (in excel) that shows each of the following in each column (as a minimum)
   1. DESRCIPTION
   2. TAG No.
   3. FUNCTION
   4. UTILITY FACTOR
   5. ABSORBED LOAD (kW)
   6. EQUIPMENT RATING POWER (kW)
   7. UTILISATION FACTOR (pu)
   8. EFFICIENCY - η (%)
   9. POWER FACTOR (Cos φ)
   10. LOAD FACTOR (pu)
   11. NOMINAL VOLATGE (V)
   12. CURRENT (A)
   13. START METHOD (DOL or VSD)

2. Can the load show actual power drawn from the system in each of the operating modes 1. Charging, 2. Discharging, 3. Standby, 4. Island, 5. Blackout

3. Load list to provide total power (Amps, kW) drawn form the system

SPECIFICATION

TERMINAL STRIP

-XE1	MAIN POWER SUPPLY 600V AC
-XE2	DC POWER SUPPLY 1000V DC
-XE	MAIN POWER SUPPLY 400V AC
-X1	MAIN POWER 400V/230V AC
-X2	LIGHT CABINET 230V AC
-X3	CONTROL VOLTAGE 24V DC
-14X1	CONTROL VOLTAGE 24V DC (TO DC CONTACTORS)
-X5	LOW-VOLTAGE SIGNALS
-XDC0	24V DC POWER SUPPLY
-XDC1-4	CONTROL VOLTAGE 24V DC (UPS)
-XT	TRANSFER TERMINAL BLOCK 24V DC / 230V AC

WIRING COLOR

L1 / L2 / L3	=	BLACK
N	=	LIGHT BLUE (IEC) / GREY (UL)
PE	=	YELLOW-GREEN
EXTERNAL VOLTAGE	=	ORANGE
CONTROL VOLTAGE 24 V DC	=	DARK BLUE
ANALOG SIGNALS	=	WHITE

PLACE

+CTRL	=	Control cabinet
+CON	=	Converter cabinet
+IND	=	Inductor cabinet
+CIR	=	Circuit breaker cabinet
+COSY	=	Cooling System
+FAN	=	External fan

71 — 72
83 — 84 /351.1

If the safety relais triggers or a failure is detected, then is the feedback "true".

Note:
The feedback circuit monitors the positions of the positive-guided NC contacts on the contactors 195K1 and 195K2. If one of their contacts latsches, then it is not possible to switch the contactors back on.
