1 About this Document

This document summarizes the characteristics of offered BESS system.

2 General Characteristics

Characteristics of the offered BESS system are briefly listed in this section. Please consult attached documents and annexes for further details.

2.1 FREQCON PCS

The FREQCON BESS is built to provide power and energy at the highest standards regarding safety, reliability and uptime available today. These benchmark characteristics are achieved by the combination of the safe and reliable battery storage and the FREQCON Power Conversion System (PCS): the Multi-Source Converter (MSC). FREQCON PCS is a bi-directional power inverter enabling the energy flow from and to the grid. The inverter is designed to provide 4-quadrant operation. Figure 1 shows the FREQCON PCS as a containerized solution along with a diagram showing the possibilities of connecting to different types of energy sources and loads in the same PCS.

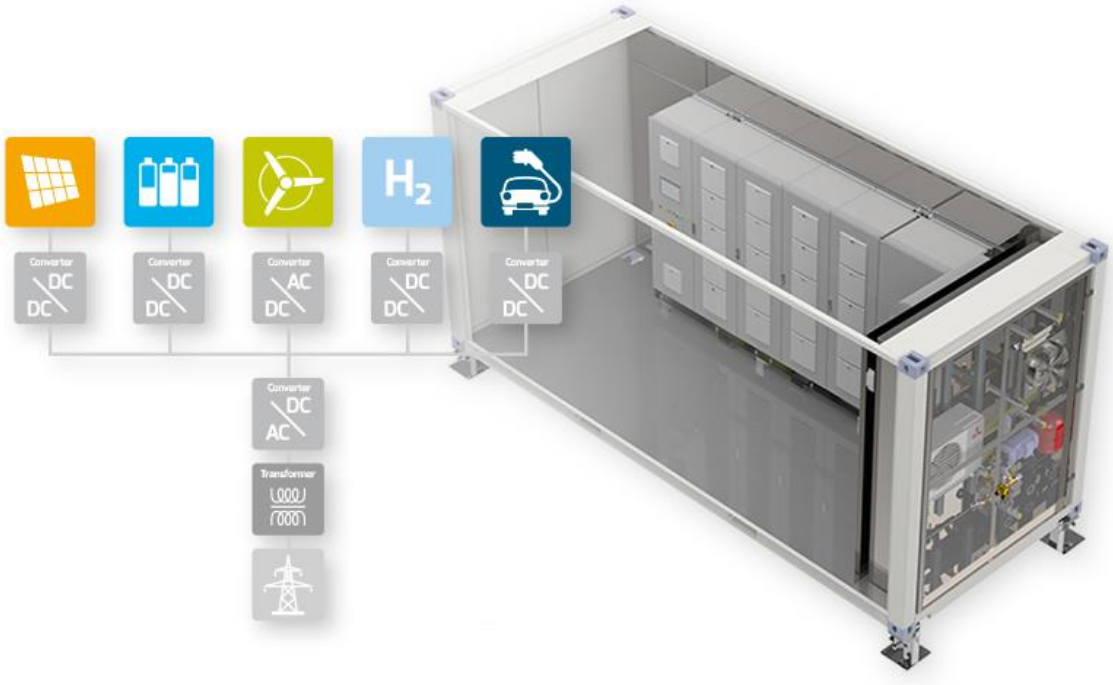

Figure 1: FREQCON PCS as a containerized solution.

The PCS is designed to be modular when it comes to connecting strings of batteries. This modularity means that at a later stage, new battery modules (FREQCON LFP8960 module or otherwise) can be connected while adapting to the new and old battery parameters simultaneously. The key to this flexibility is a central DC-bus connected with multiple DC/DC converters within the PCS.

If future extension of storage is accomplished via a different technology (or different specifications), these could be easily connected to the same PCS by installing the new IGBT powerstack(s). The IGBT powerstacks from FREQCON are modular in nature and can be installed with minimal effort.

The PCS also is flexible when it comes to connecting to the AC side (e.g. grid, factory, gensets) and it can also connect to other DC entities (e.g. PV modules, DC-grids, DC-car-charging) as seen in Figure 2.

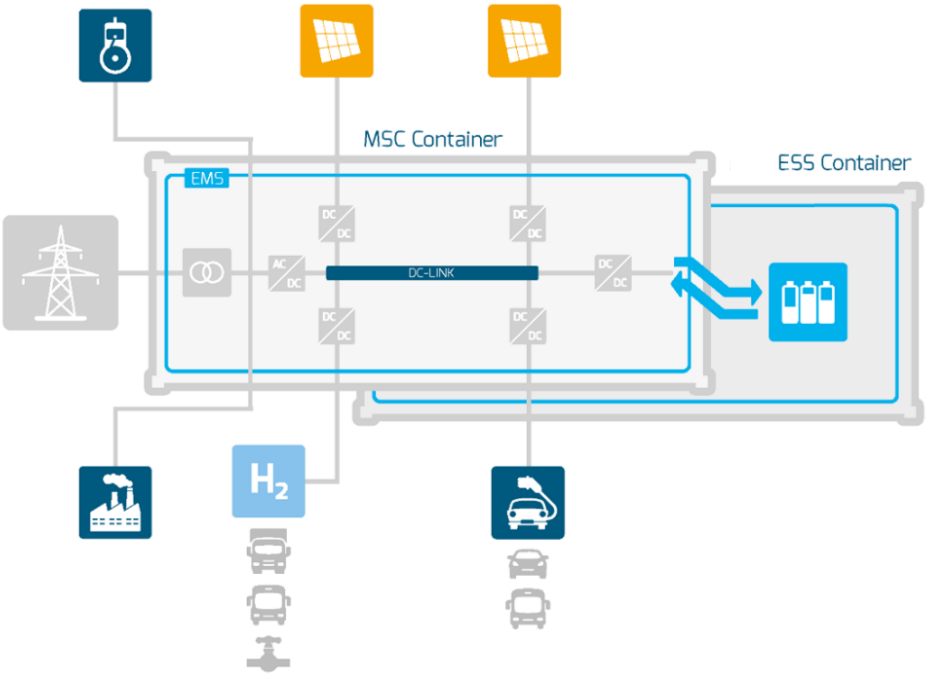

Figure 2: System diagram of integrated BESS solution by FREQCON.

Particularly important is the fact that energy hungry multiple AC/DC conversions can be avoided when charging the battery by PV, resulting in a higher overall round-trip-efficiency.

When compared with market available hybrid solutions, FREQCON PCS avoids energy losses of around 8% by avoiding the inefficient AC/DC conversions and transformer losses when the battery is charged by PV.

2.2 FREQCON Battery Storage

FREQCON relies on trusted and renowned manufacturers for battery cells. The battery storage for this offer is comprised of LFP LF280K battery cells from EVE. Table 1 shows the specifications of the battery cell.

Table 1: Parameters of LFP battery cell LF280K.

Parameter	Value
Nominal capacity	280 Ah
Nominal voltage	3.2 V
Maximum continuous charge/discharge	1C / 1C
Cut-off voltage charge	3.65 V
Cut-off voltage discharge	2.50 V
Self-discharge rate per month	≤ 3%

Using the LF280K battery cells, FREQCON constructs its LFP8960 battery modules for FREQCON battery storage solutions.

Figure 3: Freqcon battery module with 10 LF280K battery cells in series.

In each battery rack (1000mm x 1000mm x 2200mm) for this offer, 28 LFP8960 modules are connected in series to supply 700 VDC (at minimum cut-off voltage 2.5 VDC from each battery cell) from each battery rack. At maximum voltage of 3.65 VDC from each cell, the voltage supply from each rack would be 1,022 VDC.

Figure 4: Battery storage racks with 28 battery modules with total installed capacity of 250.88 kWh per rack.

3 Offered BESS 1 MW / 5.5 MWh

Characteristics of the offered BESS system are briefly listed in this section. Please consult attached documents for details.

3.1 PCS

The offered BESS is realized with a FREQCON PCS rated 1 MW at 620 VAC. Table 2 lists some specifications for the PCS.

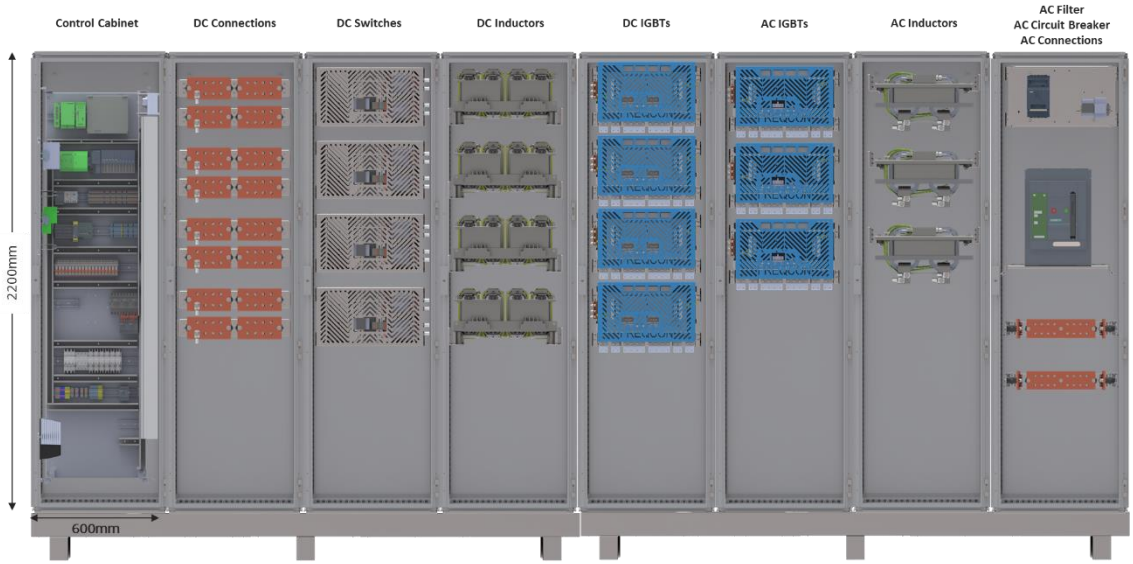

Table 2: Parameters for FREQCON PCS

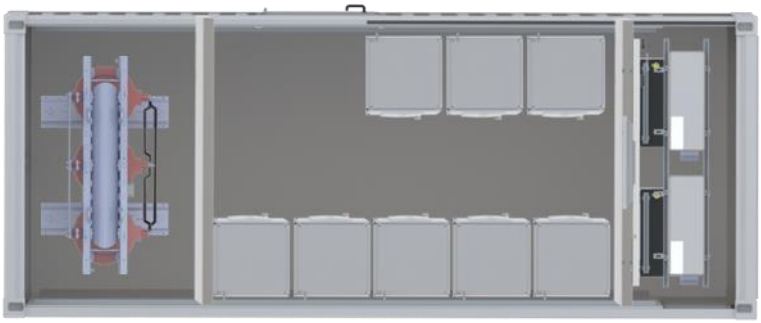
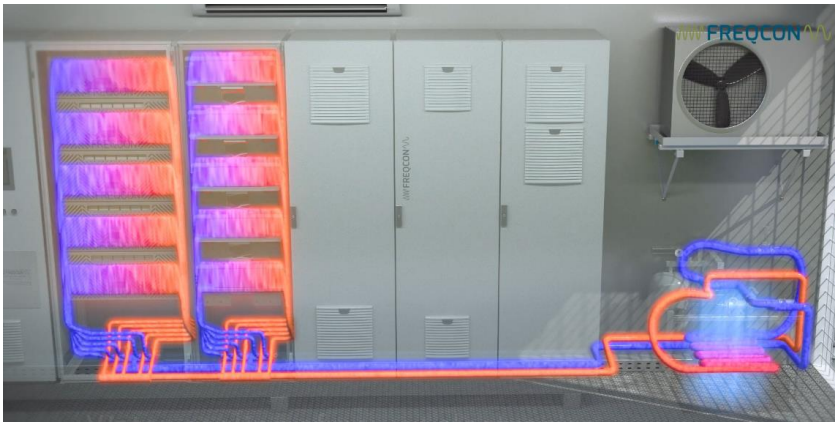
Parameter	Value
Nominal power	1,000 kW
Nominal voltage	620 V_{AC}
Nominal current (continuous operation)	931 A_{AC}
Maximum current (continuous operation)	1,050 A_{AC}
DC link voltage	1,200 V_{DC}
Number of DC outputs	8
DC current per output	500 A_{DC}
DC current total	4,000 A_{DC}



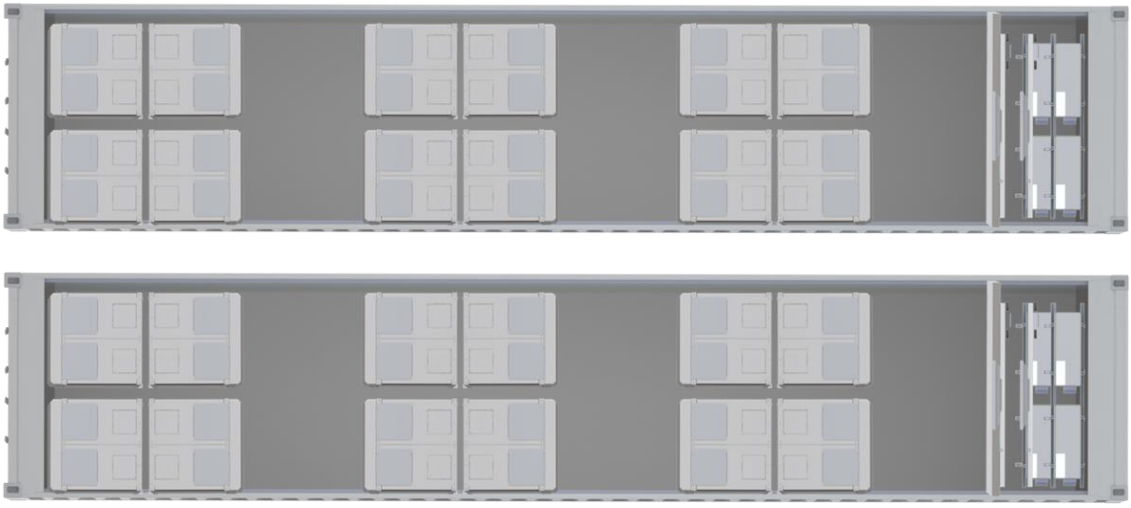
The PCS divides the battery storage into the eight IGBT powerstacks. This provides flexibility and modularity to the system. Even if the future extension of storage is accomplished via a different technology (or different specifications), these could be easily connected to the same PCS by connecting the new battery storage to one (or more) of the powerstacks and the old battery storage can be shifted to the remaining power stacks.

FREQCON PCS inherently also have the flexibility to extend the system by installing the new IGBT powerstacks to connect to the same DC link. The IGBT powerstacks are modular in nature and can be installed with minimal effort.



The PCS rated 1 MW at 620 V consists of eight cabinets (each of 600mm x 600 mm x 2200 mm). A possible overview of the PCS cabinets and the various components is shown below. Please note that this figure may not be accurate but is simply used to communicate a possible layout of components within the converter cabinets to be installed at site. The exact layout shall be communicated following the order and detailed engineering.

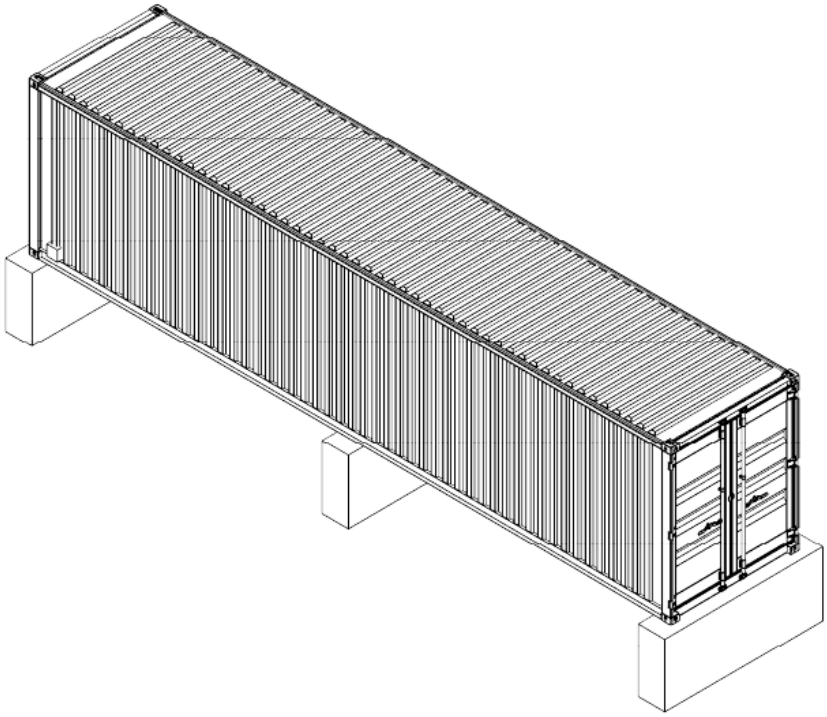
The PCS along with corresponding cooling units, heat exchangers, and 1 MVA 6.6 kV transformer is housed in a 20 ft. HC container as shown below:



FREQCON PCS is water-cooled with a closed-circuit cooling system as shown in the figure below. The water-pumps and heat exchangers are part of the offer.

3.2 Battery Storage

The corresponding battery storage consists of two 40 ft. HC container with a total installed battery storage capacity of **5,519 kWh** with its standard battery rack (described in the previous sections). The usable capacity at 90% DoD is **5,000 kWh**. To realize the installed capacity at BoL, 22 battery racks are used.



The battery racks can be easily transported and installed at target site. The battery racks are accessible for easy maintenance.

4 General Assembly and Onsite Installation

The offered containerized BESS can be delivered on site as a turnkey system with all the components i.e., inverter, and HVAC completely installed, along with empty battery cabinets. The battery modules would be transported at site separately and could be installed on site. However, it must be clarified where the installation is most optimal to be taken place.

This is because of the UN3480 regulation regarding batteries safe transport and the total allowable weight for road transport.

The containers are recommended to be placed on raised foundations. The following figures show the proposed foundations for a 40 ft. HC container. Please note that the following figures show a possible realization of the foundations. The exact design may vary depending on the project.

5 Availability and Modularity

The offered BESS is designed to be capable of remaining in operation during failures of one or more battery racks and even in case of failure of DC IGBT powerstack or inductor or switch & fuse.

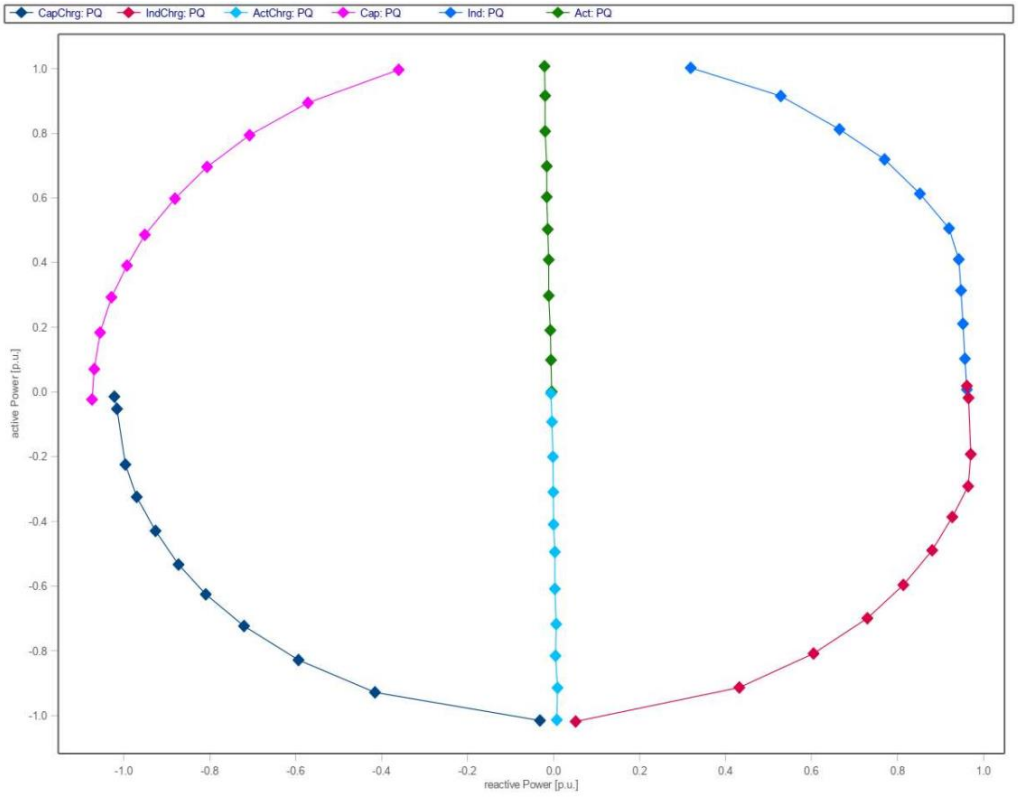
5.1 Failure of battery rack(s)

In case there is failure in battery rack(s), the PCS shall disconnect these battery racks. This results in a maximum loss of available battery storage corresponding to number of battery racks disconnected. Each battery rack has 250 kWh installed capacity.

The failing battery rack(s) can be accessed without disrupting the functioning battery racks. This means any maintenance or repair can be performed without the system being significantly affected.

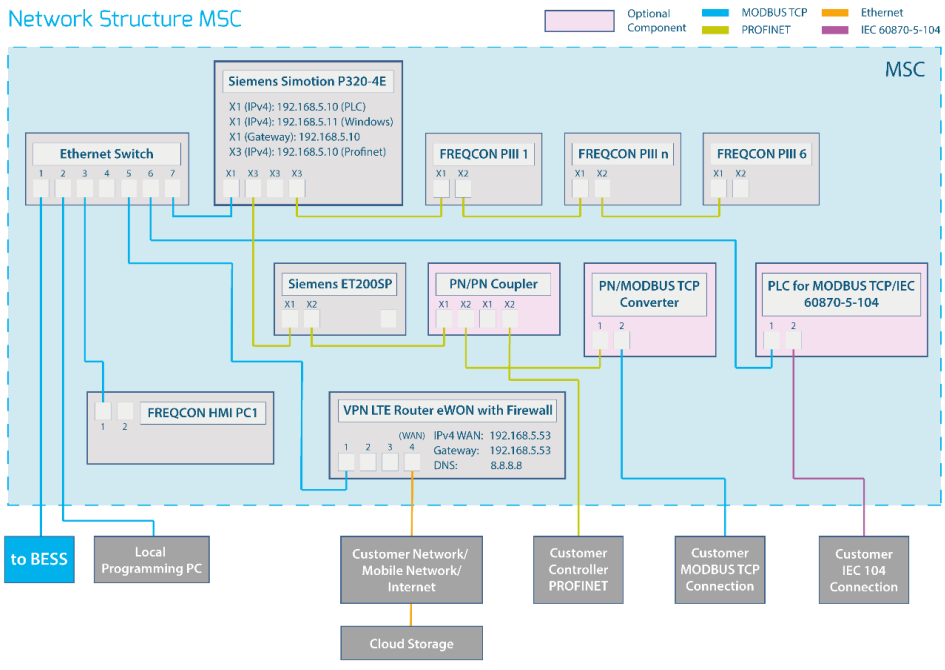
5.2 Failure of DC IGBT Stack

In case, the DC IGBT stacks encounter a failure event, the IGBT would be disconnected for repair and maintenance. The effect of the failure of DC IGBT stack would be disconnection of the battery racks connected to it.



6 Applications and EMS

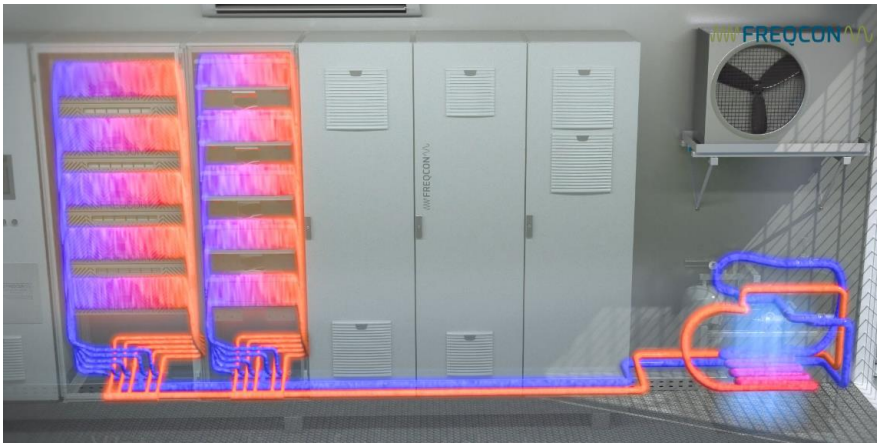
FREQCON BESS FQ is able to provide the following applications.



The addition of new applications requires only software update, which can also be performed remotely. In case, a new functionality is introduced which requires additional components, these will have to be procured and installed on site along with corresponding testing.

The FREQCON PCS is capable of providing reactive power compensation i.e. four quadrant operation. The following figure shows the results of the measurement in an active power/reactive power diagram (PQ diagram) with U = 100% Un.

The battery storage system is equipped with integrated Battery Management System (BMS). This monitors the batteries and provides all important information to the FREQCON EMS. Remote access to the system is also possible to the system for software updates as well as regular maintenance. The following figure shows the communication network of the PCS.



7 Assembly and Dismantling

The offered BESS is also flexible in assembly and eventual de-commissioning. LFP8960 battery modules are placed in individual cabinets and can easily be accessed/removed. The complete BESS is modular in nature and can be easily disassembled.

8 HVAC and Cooling

FREQCON PCS is water-cooled with a closed circuit cooling system as shown in the figure below. The water-pump and heat exchanger is part of the offer.

The HVAC signals shall be connected with Energy Management System from FREQCON PCS for optimum control.

9 Fire Protection and Suppression

The offered BESS is equipped with state-of-the-art fire protection and suppression system compliant with international standards. Each battery storage rack is equipped with active fire suppression capabilities such that other cabinets are not affected.

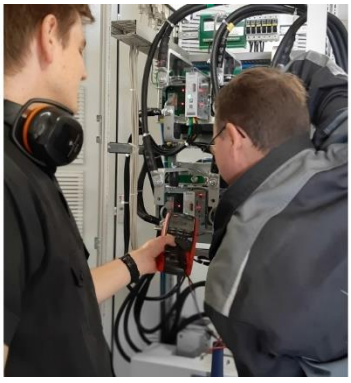
FREQCON's fire protection system aims to detect a malfunction as early as possible and suppress the problem before it results in a fire hazard. The converters, battery cabinets are equipped with several automatic detectors:

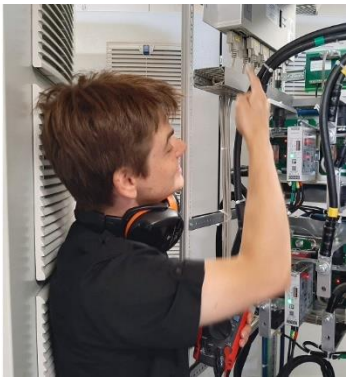
- Converter
  - Arc sensors
  - Temperature sensors
  - Smoke detectors
- Battery cabinet
  - CO sensors
  - Temperature sensors
  - Smoke detectors

- Transformer (if applicable)
  - Temperature sensors
  - Smoke detectors

10 Norms and Standards

The offered BESS is compliant with the norms and standards listed in the technical requirements for BESS. As per the requirements, if local norms are not met, FREQCON shall communicate equivalent IEC or acceptable standards.





Furthermore, FREQCON has an in-house testing facility with a grid simulator. Grid converters up to 3 MW can be tested at this facility and the test bench consists of measuring instruments from accredited institutes. This enable fast, reliable, and certified managements to be carried out for FREQCON power converters.

Following is a list of applicable standards and guidelines including grid codes:

- ANSI C57. 12.28-2005
- ANSI Z535-1994
- ANSI/NEPA70 (2008)
- BDEW Mittelspannungsrichtlinie
- CEI (Italy)

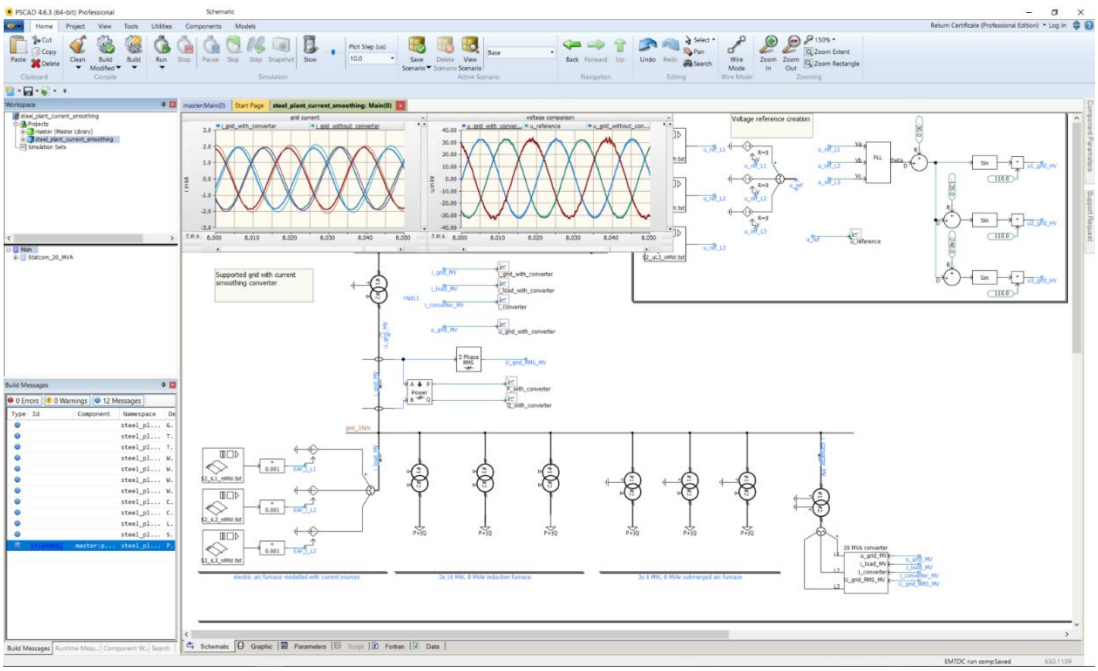
- VDE-AR-N 4130

FREQCON has an in-house 3 MW full load test bench at the Rethem facility. It allows us to test our newly developed products under realistic conditions as well as carrying out certified measurements on behalf of our customers.



The test bench provides the following services:

- Set-up of an island grid with individual parameter specification
- Measurements of grid quality
- Acceptance tests
- Simulation of incidents or grid events
- Defined by grid codes
- Customer-specific (voltage, frequency, symmetrical, asymmetrical, LVRT, HVRT, FRT)
- Testing and modeling based on available grid data
- Customer project measurements for certifications (wind turbines)
- Verification of grid-code compliant operation
- Verifying software implementations of new algorithms

Electromagnetic transients (EMT) simulations are also performed to find any weak spots at an early stage. The behavior of the system is simulated and communicated with client until agreement is reached.

Therefore, all grid requirements are simulated and verified before delivery of product. Furthermore, test data, results and the FAT is documented is sent to client before delivery.

1. Scope

This specification is applied to Rechargeable LFP Power Battery with aluminum shell (3.2V 280Ah) manufactured by EVE Energy Co., Ltd., in which the description and model, main performance, test conditions and precautions of the product are included.

The product can be applied for Vehicle power supply, Storage system, etc.

2. Description and Model

2.1 Description: LFP Li-ion Power Battery with aluminum shell.

2.2 Model: LF280K

3. General Technical Parameter

#	Item		Parameter	Remark
1	Nominal Capacity		280.0 Ah	(25±2)℃, Standard charge and discharge
2	Typical Voltage		3.2 V	
3	AC Impedance Resistance(1KHz)		≤0.25 mΩ	
4	Standard charge and discharge	Charge / discharge current	0.5 C/0.5 C	
		Cut off voltage of charge / discharge	3.65 V/2.5 V	
5	Maximum charge / discharge current	Continuous charge / discharge	1 C/1 C	According to continuous / pulse charge and discharge ammeters
		Pulse charge / discharge (30s)	2 C/2 C	
6	Recommended scope of SOC		10%～90%	N.A.
7	Charging Temperature		0 ℃～55 ℃	According to continuous / pulse charge and discharge ammeters
8	Discharging Temperature		-20 ℃～55 ℃	

#	Item		Parameter	Remark
9	Storage temperature	Short term (within 1 month)	-20℃~45℃	N.A.
		Long term (within 1 year)	0℃~35℃	
10	Storage humidity range		<90%	
11	Self-discharge rate per month		≤3%/month	Temperature: (25±2)℃, Storage scope of SOC: 30%~50%SOC
12	Dimension	Width	173.7 ±0.5 mm	Refer to Appendix I
13		Thickness (under 300±20 kgf, 30%~40% SOC)	72.0 ±1.0 mm	
		Average thickness (200 pcs, under 300±20 kgf, 30%~40% SOC)	72.0 ±0.5 mm	
14		High (total)	207.5 ±0.5 mm	
15		High (subject)	204.6 ±0.5 mm	
16		Tabs Distance	123.0±0.3 mm	
17	Battery weight		5.42±0.3 kg	

4. Test conditions

4.1 Test environment conditions

Temperature: 25±2℃

Relative humidity (RH): 15%~85%

Atmospheric condition: 86KPa~106KPa

4.2 Standard Charge

The standard charge means charging the cell with charge current 0.5C(A) and constant voltage 3.65V at (25±2)℃, 0.05C cutoff.

4.3 Standard Discharge

The standard discharge means discharging the cell with discharge current 0.5C(A) and cutoff voltage 2.5V at (25±2) ℃.

4.4 Pole and Busbar welding requirements

No.	Item	Parameter	Remark
1	Penetration	≤ 2.5mm	
2	Pulling force	60-100kgf	
3	Temperature of pole plastic part	≤ 150℃	Related to power and time
4	The pressure on the pole	≤ 700N	

5. Main Performance

5.1 Electrical performance

No.	Item	Requirements	Measuring Procedure
1	Rate discharge performance at 25℃	Discharge capacity/nominal capacity×100% A) 0.5C (A) ≥100% B) 1.0C (A) ≥98%	After standard charge and 1h rest, discharge to 2.5V cutoff with the current of 0.5 C (A), 1.0C (A), respectively. If the discharge capacity fails to meet the technical requirements, this test is allowed to be repeated three times
2	Discharge performance at different temperature	Discharge capacity/nominal capacity×100% A)55℃≥95%(Cutoff 2.5V) B)-20℃≥70%(Cutoff 2.0V)	Measure the initial capacity and state of the battery: A) after standard charge and 5h rest at 55℃, discharge to 2.5V cutoff with the current of 0.5C(A); B) after standard charge at 25±2℃ and 24h rest at -20℃±2℃, discharge to 2.0V cutoff with the current of 0.5C(A).
3	The capacity retention and recovery at 25℃	Capacity Retention ≥ nominal capacity×95% Capacity Recovery ≥ nominal capacity×97%	Measure the initial capacity and state of the battery, after standard charge and stored for 28 days, discharge to 2.5V cutoff with the current of 0.5C (A), calculate the remaining capacity, the retention can be expressed as a percentage of nominal capacity. After standard charged and 30mins rest, calculate the discharging capacity (Ah), the recovery can be expressed as a percentage of nominal capacity. The recovery is measured with discharge current 0.5C (A) with 2.5V cut-off at (25±2) ℃.
4	cycle life at 25℃	≥6000 cycle @0.5C/0.5C	Under the 300kgf clamp, after standard charged and 30mins rest, discharge to 2.5V cutoff with the current of 0.5C(A) at (25±2) ℃, and then start the next cycle, end with the capacity decreasing to 80% of the

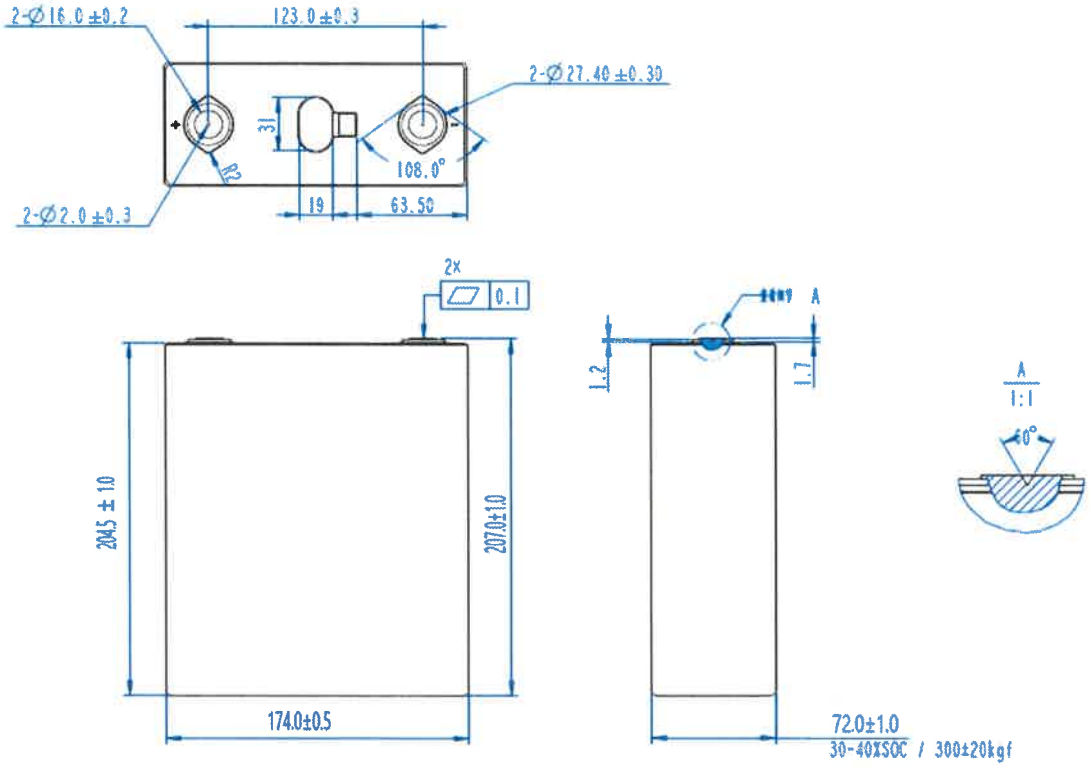
			initial capacity. The number of cycles is defined as the cycle life of the battery.
5	cycle life at 45℃	≥2500 cycle @0.5C/0.5C	Under the 300kgf clamp, after standard charged and 30mins rest, discharge to 2.5V cutoff with the current of 0.5C(A) at (45±2) ℃, and then start the next cycle, end with the capacity decreasing to 80% of the initial capacity. The number of cycles is defined as the cycle life of the battery.
6	End of life managem ent	capacity/nominal capacity <70%	During the use of the battery, the battery s hall be stopped when the end of life regul ations are exceeded.

5.2 Safety performance

No.	Item	Requirements	Measuring Procedure
1	Over Discharge	No fire、No explosion	Reference: GB/T 36276-2018 《Lithium ion battery for electrical energy storage》
2	Over Charging	No fire、No explosion	
3	Short-Circuit Test	No fire、No explosion	
4	Drop Test	No fire、No explosion	
5	Heating	No fire、No explosion	
6	Extrusion Test	No fire、No explosion	
7	Low pressure test	No fire、No explosion、No leakage	
8	Thermal runaway	No fire、No explosion	

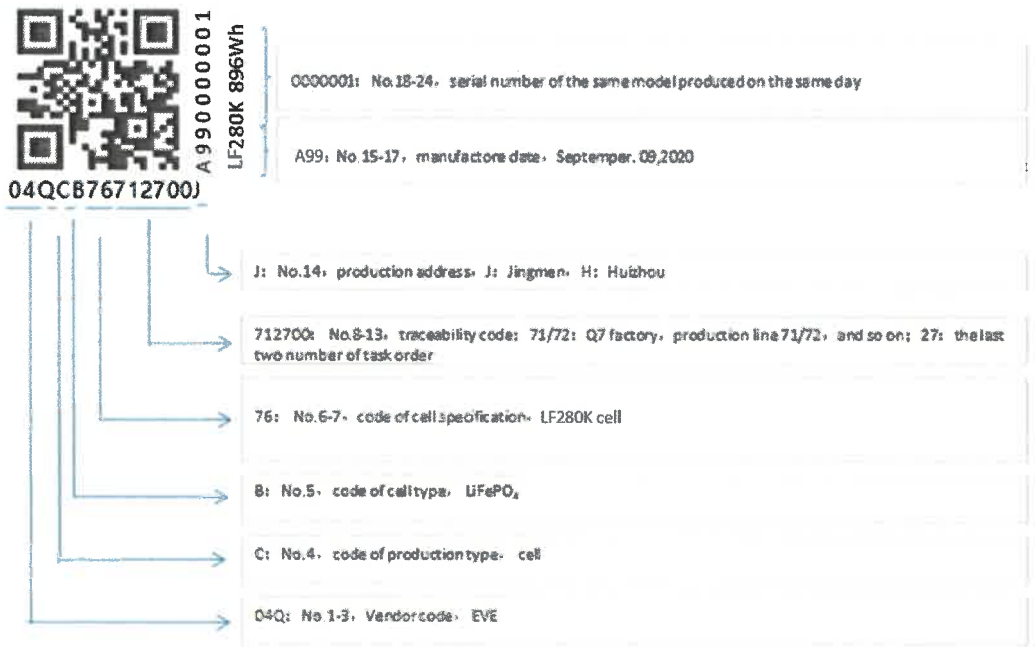
6. Transportation

Battery for shipping should be packed in boxes with the State of charge (30%~50%SOC). The Violent vibration, impact extrusion, sun and rain should be prevented during shipping.



7. Storage

Batteries should be stored (more than 1 month) indoor with a dry and clean environment at 0 ℃~35 ℃. Avoiding contact with corrosive substances and staying away from fire and heat source. The battery should be charged and discharged every 6 months. The SOC for storage is between 30% ~ 50%.



8. Points for attention

1. When the battery is charged and discharged, the conditions for monitoring and protecting the battery voltage, current and temperature shall be ensured.
2. Please keep the battery away from the heat source, fire source and other corrosive environments such as heating, strong acid and strong alkali.
3. Do not short circuit the battery or install it with incorrect polarity at any time，otherwise it can cause serious damage to the battery and cause danger.
4. Do not mix batteries of different models or manufacturers.
5. Do not use external force to make the battery fall, impact or puncture. Do not disassemble the battery or change the external structure.
6. When the battery is not used for a long time, please keep the battery in the state of 30%-50% SOC, and avoid the environment of strong direct sunlight or high temperature and humidity.
7. When operating the battery, it is necessary to wear rubber gloves and other protective devices.
8. In case of leakage, smoke or damage of battery, please stop using immediately and contact our company for handling.

1 Introduction

1.1 About this Document

This document is part of the documentation for the Base Load Power Hub (BLPH) Project (K559-2254). In case of any contradiction resulting by the information or specification given in this document, later documents supersede the information provided in this document.

1.2 Display Elements

Original document

This document is an original document of FREQCON GmbH.

1 Introduction

1.1 About this Document

This document is part of the documentation for the Base Load Power Hub (BLPH) Project (K559-2254). In case of any contradiction resulting by the information or specification given in this document, phase 2 or later documents supersede the information provided in this document.

1.2 Other Applicable Documents

The following documents are applicable:

Document type	Document Name
Bill of Materials	Bill_of_Materials.zip

Table 1: Other applicable documents

1.3 Generic Terms and Abbreviations Used

This following list should help you understand some of the abbreviations used in this document.

Generic Term and Abbreviation	Description
BESS	Battery Energy Storage System
BLPH	Base Load Power Hub
BoM	Bill of Materials
PCS	Power Conversion System

Table 2: Generic terms and abbreviations used

2 General

The bill of materials of the main system components are attached to this document (*see section 1.3 "Other Applicable Documents"*).

File name: Bill_of_Materials.zip

1 Introduction

1.1 About this Document

This document is part of the documentation for the Base Load Power Hub (BLPH) Project (K559-2254). In case of any contradiction resulting by the information or specification given in this document, phase 2 or later documents supersede the information provided in this document.

1.2 Display Elements

Symbol	Meaning
➜	Action with one or several steps for which the sequence is irrelevant.
Step 1 : **Step 2 :**	Action with several steps for which the sequence is relevant.
•	First level of list.
-	Second level of list.

Table 1: Display Elements

1.3 Other Applicable Documents

The following documents are applicable:

Document type	Document Name
Single Line Diagram – FREQCON BESS and PCS	10354_23A2007_CAE_Statron_Shell Crosswind BESS FQ 1MW 5MWh Offshore_Single Line Diagram

Table 2: Other applicable documents

1.4 Generic Terms and Abbreviations Used

This following list should help you understand some of the abbreviations used in this document.

Generic Term and Abbreviation	Description
BESS	Battery Energy Storage System
BLPH	Base Load Power Hub
PCS	Power Conversion System

Table 3: Generic terms and abbreviations used

2 General

The electrical single line diagram of the proposed BESS and PCS system is attached to this document (*see section 1.3 "Other Applicable Documents"*).

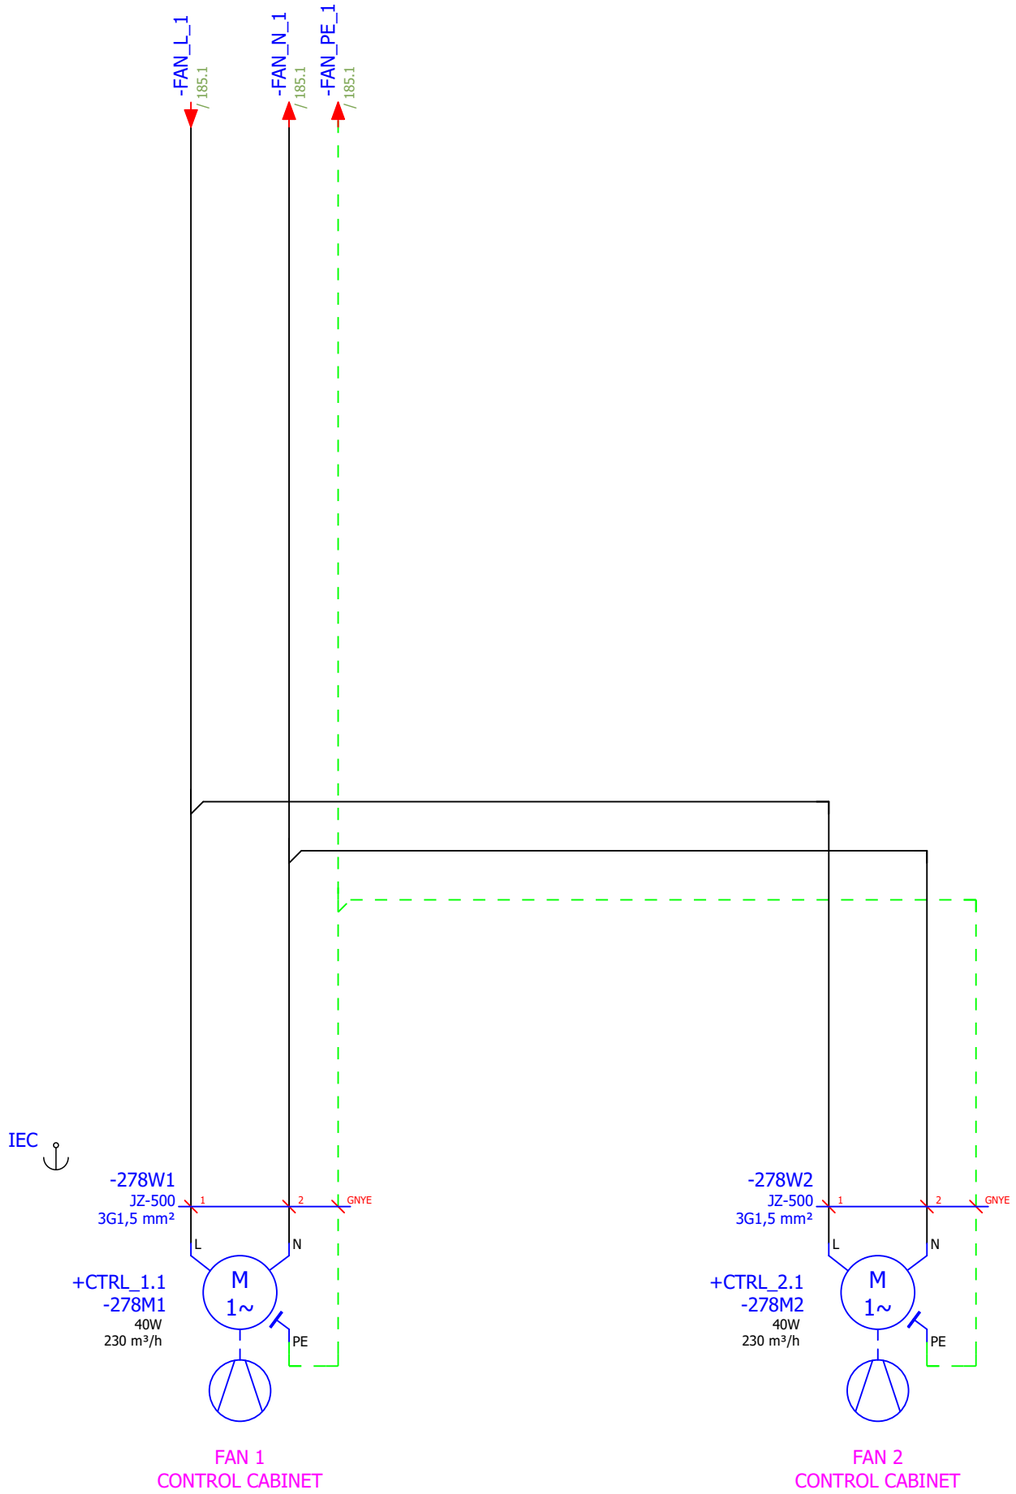
SHUTDOWN CIRCUIT BREAKERS / DC CONTACTORS

FAULT SIGNAL SAFETY RELAY



If the safety relais triggers or a failure is detected, then is the feedback "true".

Note:
The feedback circuit monitors the positions of the positive-guided NC contacts on the contactors 195K1 and 195K2. If one of their contacts latsches, then it is not possible to switch the contactors back on.

SPECIFICATION

TERMINAL STRIP

-XE1	MAIN POWER SUPPLY 600V AC
-XE2	DC POWER SUPPLY 1000V DC
-XE	MAIN POWER SUPPLY 400V AC
-X1	MAIN POWER 400V/230V AC
-X2	LIGHT CABINET 230V AC
-X3	CONTROL VOLTAGE 24V DC
-14X1	CONTROL VOLTAGE 24V DC (TO DC CONTACTORS)
-X5	LOW-VOLTAGE SIGNALS
-XDC0	24V DC POWER SUPPLY
-XDC1-4	CONTROL VOLTAGE 24V DC (UPS)
-XT	TRANSFER TERMINAL BLOCK 24V DC / 230V AC

WIRING COLOR

L1 / L2 / L3	=	BLACK
N	=	LIGHT BLUE (IEC) / GREY (UL)
PE	=	YELLOW-GREEN
EXTERNAL VOLTAGE	=	ORANGE
CONTROL VOLTAGE 24 V DC	=	DARK BLUE
ANALOG SIGNALS	=	WHITE

PLACE

+CTRL	=	Control cabinet
+CON	=	Converter cabinet
+IND	=	Inductor cabinet
+CIR	=	Circuit breaker cabinet
+COSY	=	Cooling System
+FAN	=	External fan

1 Introduction

1.1 About this Document

This document is part of project phase “Detailed Design Engineering” for the Base Load Power Hub (BLPH) Project (K559-2254). In case of any contradiction resulting by the information or specification given in this document, phase 2 or later documents supersede the information provided in this document.

1.2 Display Elements

Symbol	Meaning
➜	Action with one or several steps for which the sequence is irrelevant.
Step 1 : **Step 2 :**	Action with several steps for which the sequence is relevant.
•	First level of list.
-	Second level of list.

Table 1: Display Elements

1.3 Other Applicable Documents

The following documents are applicable:

Document type	Document Name

Table 2: Other applicable documents

1.4 Generic Terms and Abbreviations Used

This following list should help you understand some of the abbreviations used in this document.

Generic Term and Abbreviation	Description
BESS	Battery Energy Storage System
BLPH	Base Load Power Hub
PCS	Power Conversion System

Table 3: Generic terms and abbreviations used

2 Main Control System

The complete BESS is controlled and monitored by a main control system installed on the P320 PLC inside the control cabinet (CTRL). Both, the converter control system as well as the BESS control system are installed on the same PLC.

Data exchange between the individual cabinet control systems and BESS main control system is performed via MODBUS TCP protocol.

BESS Main Control System Overview

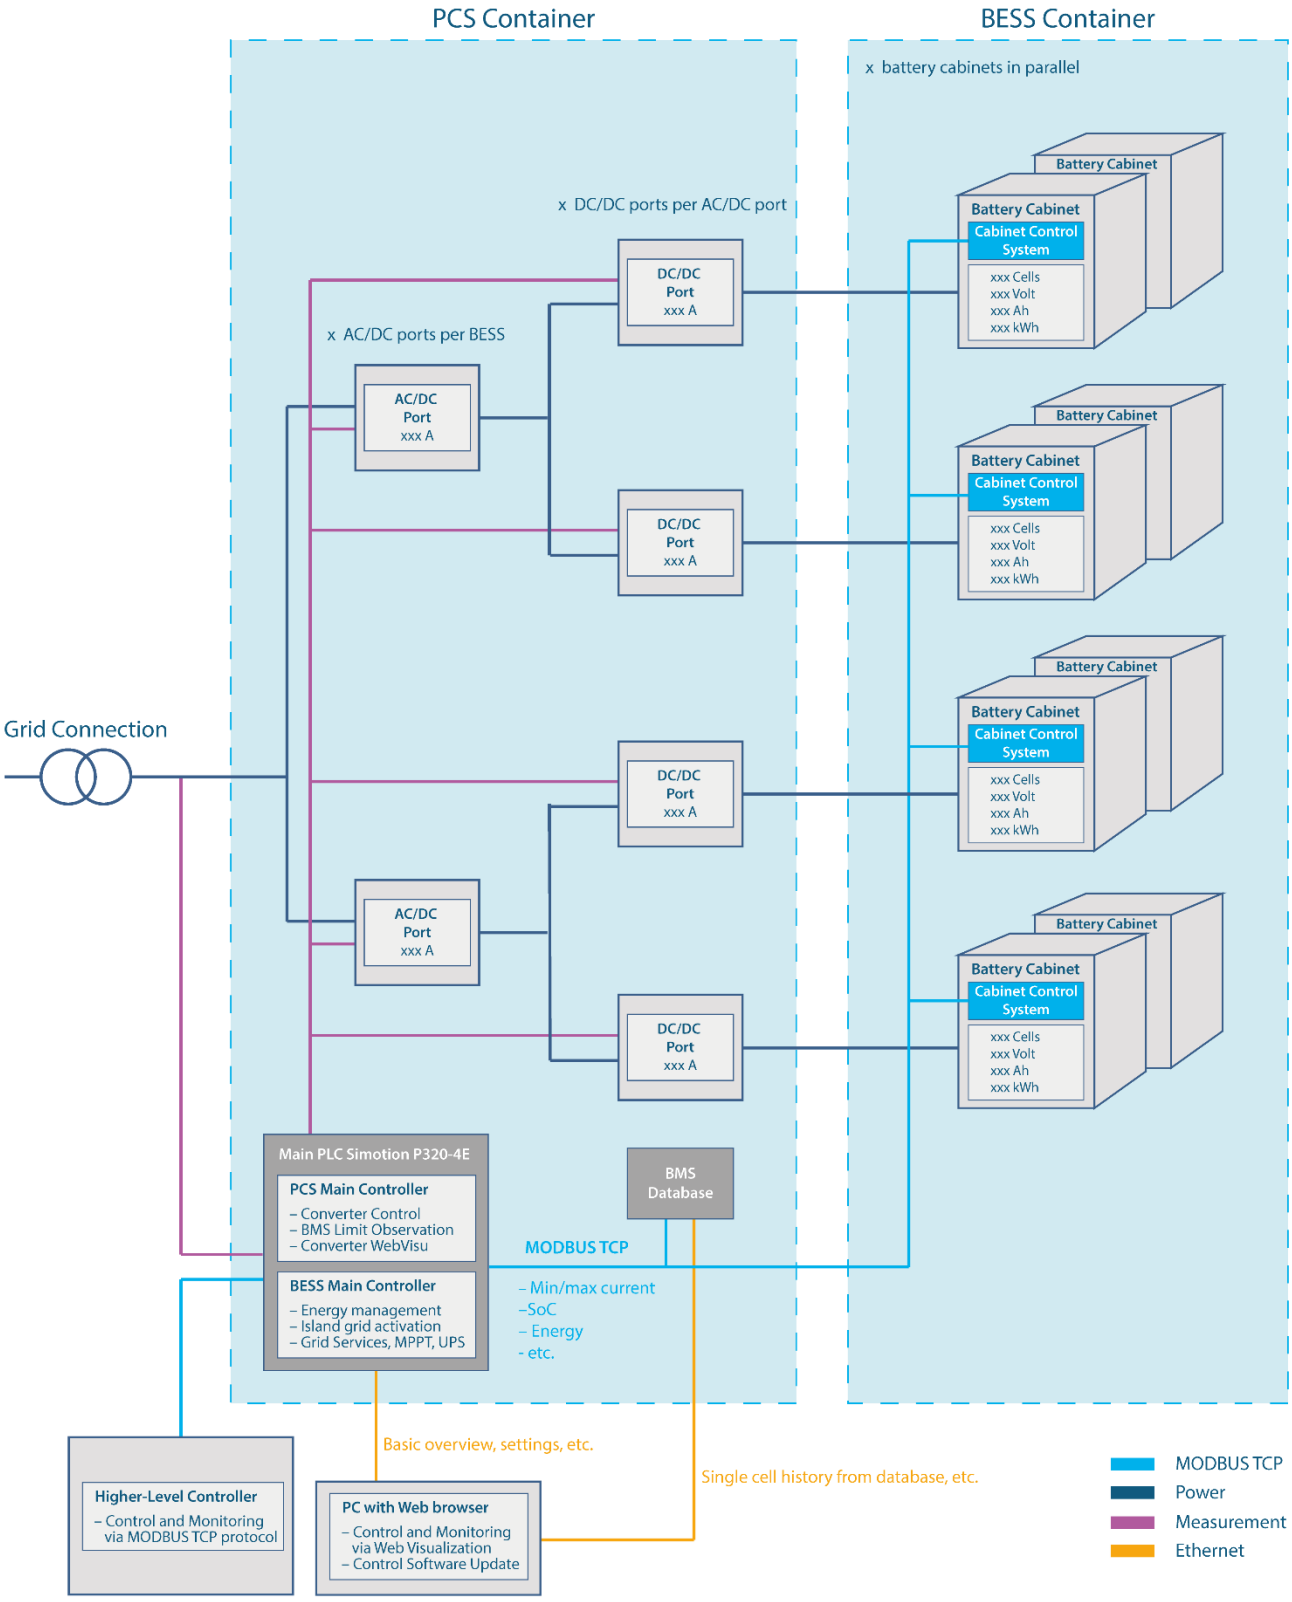

Figure 1: BESS main control system overview

2.1 Network Structure PCS

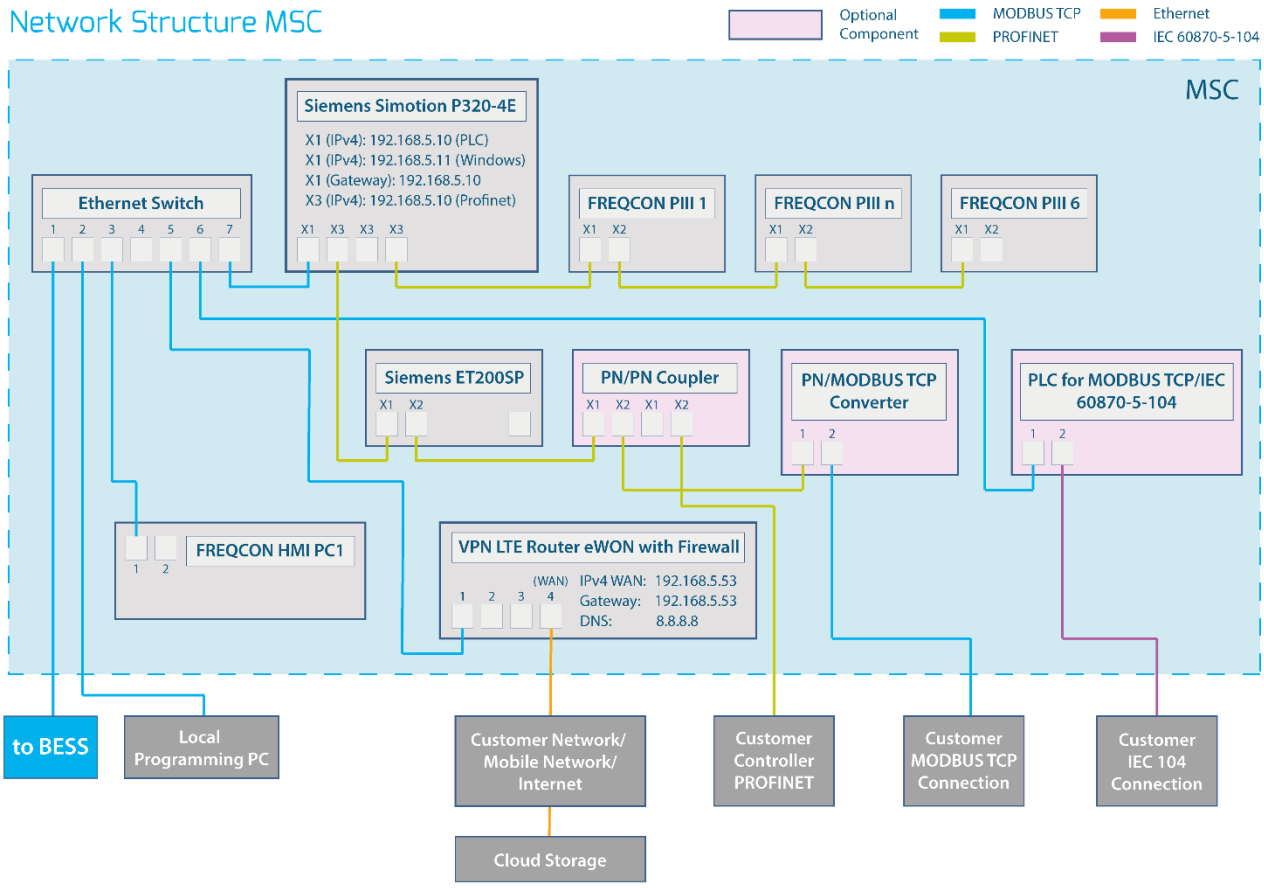

Figure 2: PCS (MSC 1000) Network Structure

2.2 Converter Main States

The individual converter main states are depicted in the flow diagram below and described in section 2.2.2.

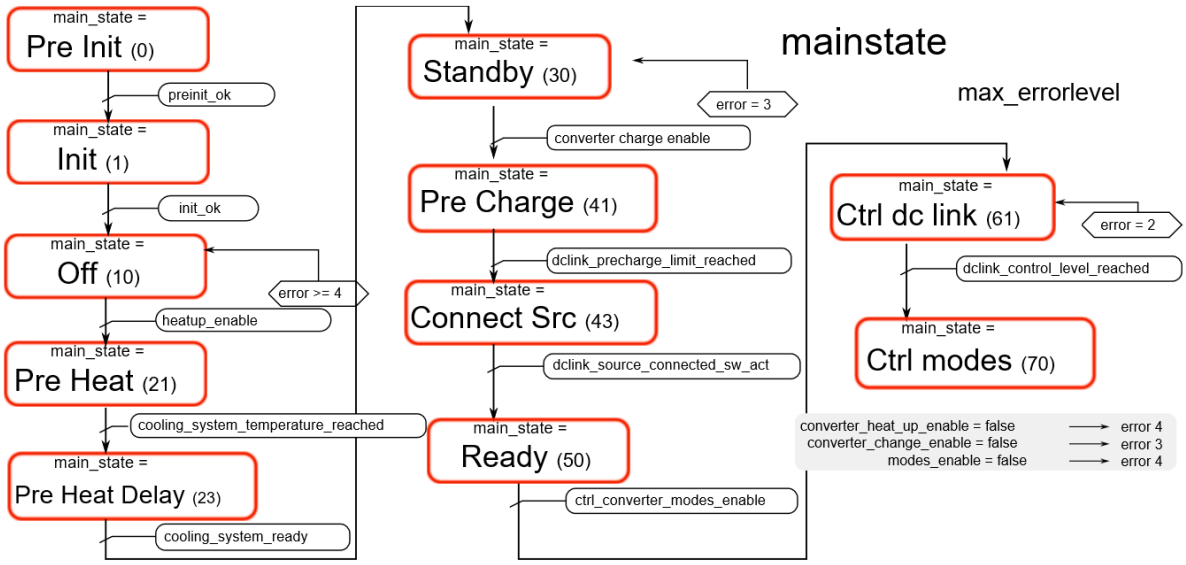

Figure 1: Converter main states

2.2.1 Error Levels

Error Level	Description
0	No error, logging information
1	Warning category, a warning limit is reached
2	Error category, stop subsystems
3	Error category, stop system and discharge DC-link, cooling system enable
4	Error category, stop system and also the cooling system

2.2.2 Main States Description

INIT

The system was turned on and the stored initialization parameters are read. Cooling and converter system are stopped.

OFF

The DC link is discharged. The converter and cooling system are not in operation.

Pre-Heat

The converter is switched-off and is preparing for operation. The cooling system regulates to the optimum temperature of the cooling water, IGBT, capacitors and inductors.

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

Heat-Delay

The converter is preparing for operation. The operation temperatures of the components are reached and maintained for a defined time span.

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

STANDBY

Standby mode – converter is off, but the cooling system is in operation.

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

Pre-Charge

The converter´s main DC-link is pre-charged to a defined voltage level.

An error level 3, such as detection of wrong grid conditions, is leading to a change to main state STANDBY (converter is off, cooling system is in operation).

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

Connect SW

Source contactor is closed.

An error level 3, such as switching error of the source contactor, is leading to a change to main state "STANDBY" (converter is off, cooling system is in operation).

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

READY

Converter is ready for operation. Cooling system is operating, the DC link is charged and source is connected.

An error level 3, such as grid faults, is leading to a change to main state STANDBY (converter is off, cooling system is in operation).

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

DC link Ctrl

The converter power module that is set to "DC link control" mode is activated.

An error level 2, such as derating, DC link errors or over temperature, are leading to a change to main state READY (converter is off, cooling system is in operation).

An error level 3, such as grid faults, is leading to a change to main state STANDBY (converter is off, cooling system is in operation).

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

Ctrl Mode

The remaining converter power modules that are enabled are activated. The converter is operating.

An error level 1, such as power module over temperature, over-current or over-voltage, is leading to a stop of the respective power module.

An error level 2, such as derating, DC link errors or over temperature, are leading to a change to main state READY (converter is off, cooling system is in operation).

An error level 3, such as grid faults, is leading to a change to main state STANDBY (converter is off, cooling system is in operation).

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

3 BESS Control System

The aim of the ESS energy storage system is to store and release electrical energy.
energy. LiFePo4 (LFP) batteries are predominantly used for energy storage in the FREQCON system. The control system described in this document has the following functions and tasks.

- Monitoring of the battery cells
- Communication interface to consumers (converters) and chargers
- Communication interface to databases
- WebVisualisation for service purposes

Components of the system

- Battery cabinet control system
- Battery modules
- BMS
- Sensors (current, voltage, temperature, etc.)
- DC switches and line protection

3.1 Battery Cabinet Control System

Each battery cabinet is equipped with its own control system (Siemens S7) collecting the relevant data from the individual battery modules and providing these to the BESS and PCS main control system.

The tasks and features of the battery cabinet control system are the following:

- Monitoring of battery cell voltages and temperatures
- Monitoring of the battery charging and discharging current
- Control of DC switches
- Monitoring of line protection and smoke detectors
- MODBUS RTU Master for communication with BMS system (battery monitoring system)
- MODBUS TCP Server provides the communication interface to other systems

Cabinet Control System Overview

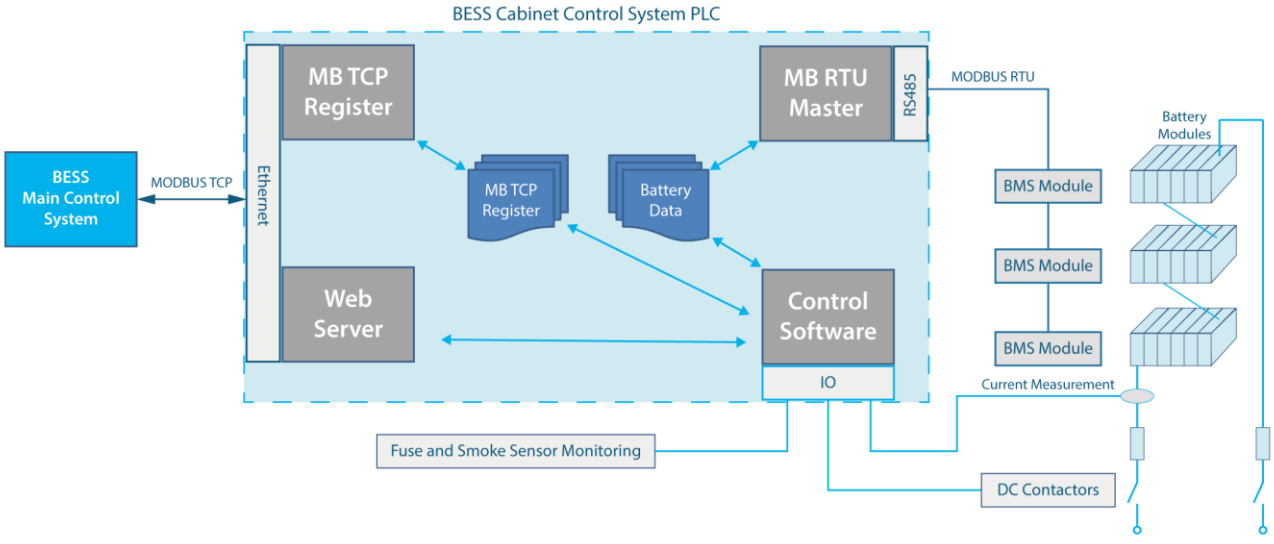

Figure 3: BESS cabinet control system overview

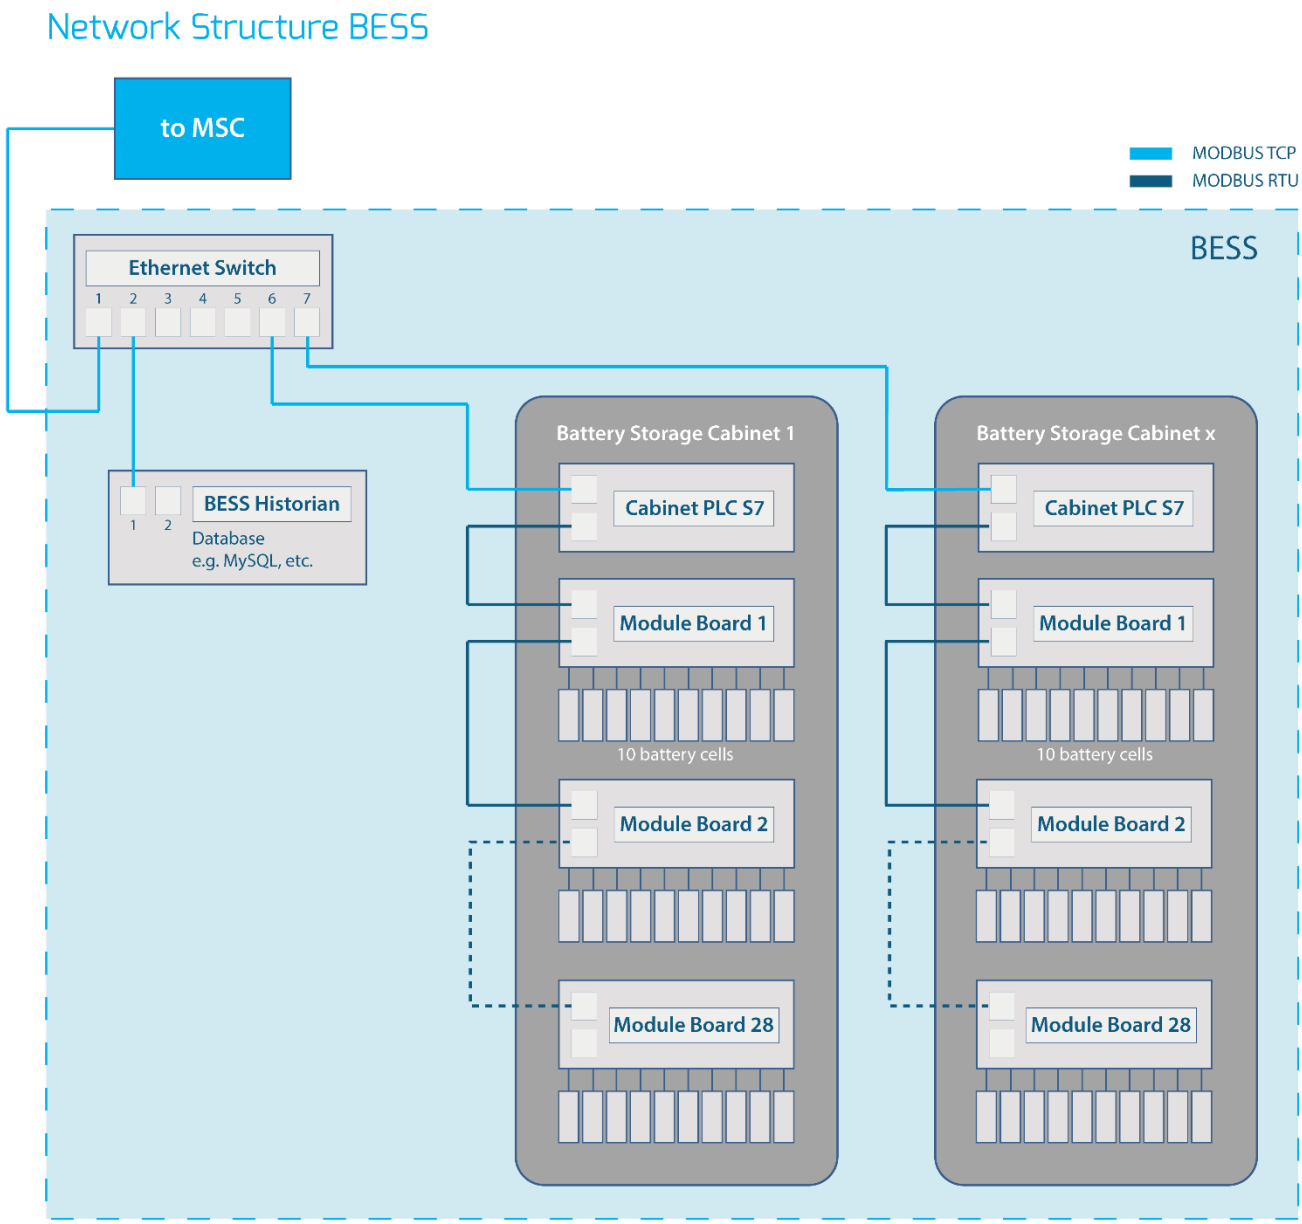
Data exchange between the cabinet control system and the individual battery modules is performed via MODBUS RTU protocol. Therefore, each battery cabinet is provided with several MODBUS RTU interfaces for Modbus connection of the battery modules.

3.2 Network Structure BESS Control



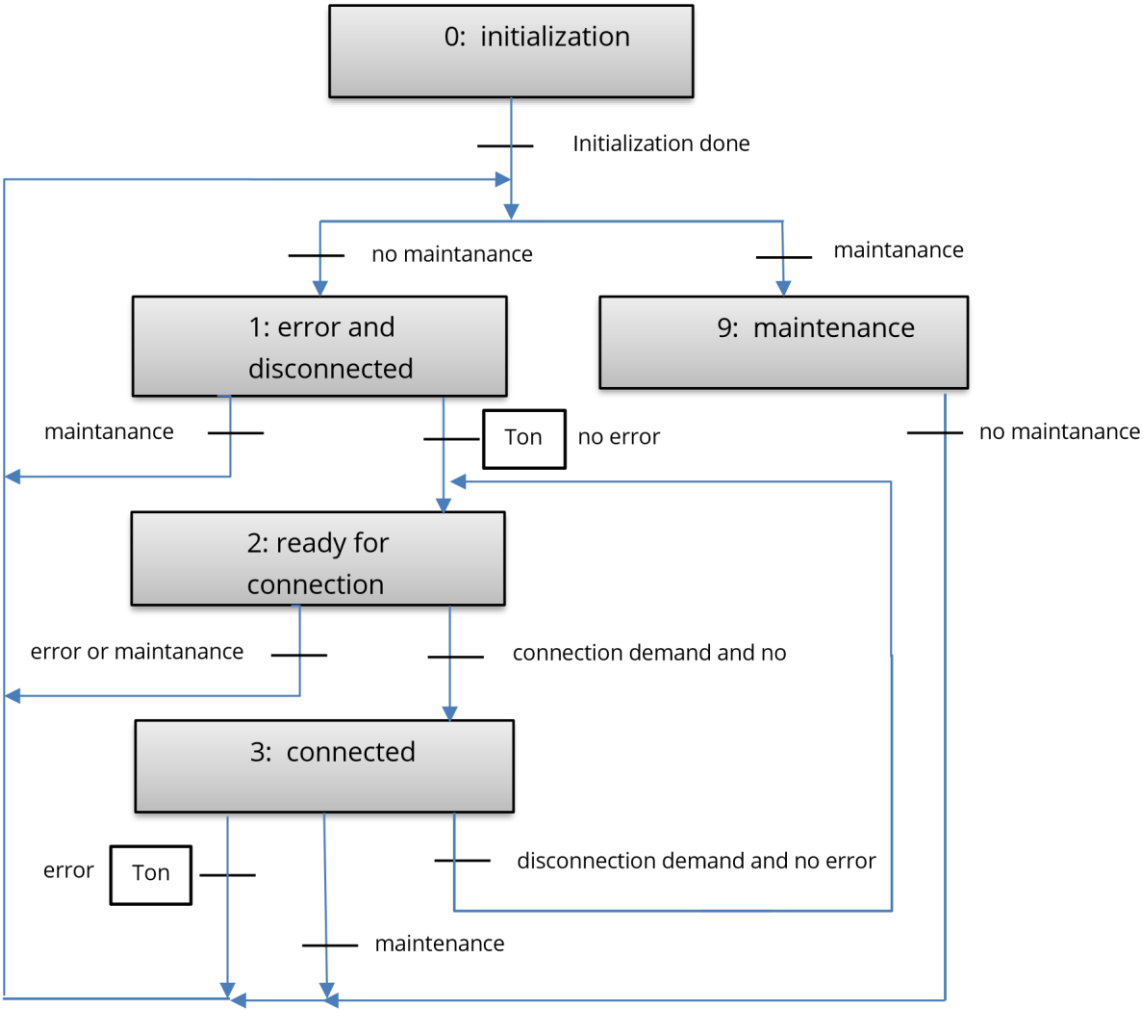


Figure 4: BESS Network Structure

3.3 BESS Main States

The individual BESS main states are depicted in the flow diagram below and described in the following section.

3.3.1 Main States Description

Initialization

The system parameters are set and stored operating data is read back. After successful initialization the status changes to the state “Error and disconnected”.

Error and Disconnected

The energy storage system (ESS) has an error and the system is disconnected from consumers/generators. If there is no error message, the system changes to the ready for connection state.

Ready for Connection

The BESS is error-free and ready to connect the consumers/generators. An external control signal (MODBUS TCP connection to the inverter/consumer) triggers the change to the connected state.

Connected

The BESS is connected to the loads/generators. If the external release for the connected state, the system switches to the disconnected state. If an error message is present, the system switches to the error and disconnected state after a time delay (init parameter). The time delay (TON) provides the external inverter/consumer with the required time period for battery current reduction to 0 A.

Maintenance

The ESS is disconnected from the load/generator. In this operating state the following functions are enabled:

- Modification of MODBUS RTU slave addresses (battery modules)

4 Operating Interfaces

The BESS/PCS is operated and controlled either via

- The control panel on the control cabinet CTRL of the converter system (*see figure below,* ②)
  - Push-buttons
    - RESET (restart emergency stop circuit)
  - Indication lights:
    - Fault (red; controller error is active)
    - Preheating (yellow; preheating of coolant)
    - Ready for Operation (green; converter is ready for operation)
    - Operating (green; converter is active)
  - Other control elements:
    - Main switch
    - Emergency-stop push button (optional)

- interface to the customer's higher-level control system(s)
- HMI (TFT panel) on control cabinet door (*see figure below,* ①)
- FREQON WebVisualization (*see figure below,* ②)

4.1 Control Panel

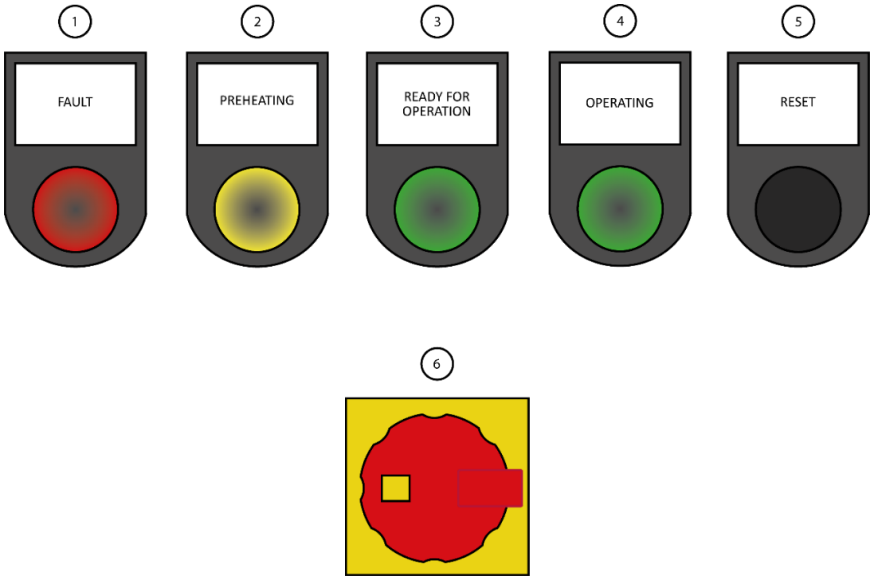

Figure 5: Control panel

4.2 Indicator Lights

Pos.	Indicator Light	Description
①	**Fault**	**Flashing light:** A warning of the converter main controller is present. The converter remains in operation. **Constantly glowing:** A fault has been detected by the converter main controller. Converter stops operating.
②	**Preheating**	**Flashing light:** The cooling system is preheating until the set cooling temperature value has been reached. **Constantly glowing:** The coolant temperature has reached the set temperature and is maintained for a set time span (defined in controller). **Light off:** The coolant temperature was maintained to the set cooling temperature for the time span defined in the controller. The preheating process is finished.
③	**Ready for Operation**	**Flashing light:** The DC-link of the converter is pre-charging until the set voltage has been reached. **Constantly glowing:** The DC-link is precharged to the set voltage and the power switches are closed.
④	**Operating**	The converter ´s IGBT´s are enabled and the converter is operating.

Table 4: Indicator Lights

4.3 Control Elements

Pos.	Control Element	Description
⑤	**Reset** *Push button*	Resets an existing converter fault.
⑥	**Main switch** *Selector switch*	**ON**: To enable the converter, set the selector switch to ON-position. **OFF**: To power-off the B2G Converter, set the selector switch to OFF-position.

Table 5: Control Elements

5 Data Interfaces

The BESS/PCS system can be connected to a higher-level control unit (control room) via MODBUS TCP interface (PROFINET as option). The required parameters (current, voltages, frequency, power) are provided by the BESS/PCS main control system and transmitted via MODBUS TCP protocol.

The higher-level controller is connected to the BESS/PCS main control system via a network isolator (113T1) inside the CTRL control cabinet of the PCS system.

For external control and monitoring of the converter, it is necessary that the customer has access to selected control and status variables stored in the BESS/PCS main control system, which can be read and overwritten by the customer's higher-level control. For this purpose, predefined control profiles with the relevant control variables and status profiles with all relevant status variables are stored for the data transfer between the customer's higher-level controller and the converter system.

5.1 Profinet

Profinet connections for the following components:

- Siemens Simotion P320 (Profinetport X3)
- ET200 IO modules
- PIII IGBT interface

The Profinet network cannot be reached from outside. A communication to a superior control is possible by a Profinet coupler. No other network traffic can be transmitted through this coupler. And thus a manipulation from the outside is excluded.

5.2 Ethernet

Ethernet connections for the following components:

- Siemens Simotion P320 (Ethernetport X1)
- HMI
- VPN Gateway
- Programming PC
- Battery Monitoring System
- Telecontrol coupler according to IEC101/104

The Ethernet network can be accessed from outside by a locally connected programming PC or by means of a secure VPN connection through a router.

6 Network Devices

6.1 Main PLC - SIMOTION P320-4 E

The control system consists of an industrial PC with Windows as operating system. A soft PLC is executed there and a web browser is provided for diagnostic purposes.
The device is protected against external access and manipulation by a router etc.

Updates of the control software can be imported in different ways:

- By removing the memory card and recording it in a CF drive.
- By uploading a compiled software via the web interface
- By uploading a software via an engineering PC

6.2 Battery Cabinet PLC - SIMATIC S7

Each battery cabinet of the BESS is equipped with a Siemens PLC with the following functions and tasks.

- Monitoring of the battery cells
- Communication interface to consumers (converters) and chargers
- Communication interface to databases
- WebVisualisation for service purposes

6.3 Switch

Industrial switch, freely configurable and updateable.

6.4 VPN Router (optional)

Industrial VPN router which separates the internal network from all external networks. A secure and protected access via a VPN connection can be configured.

6.5 HMI/WebVisu

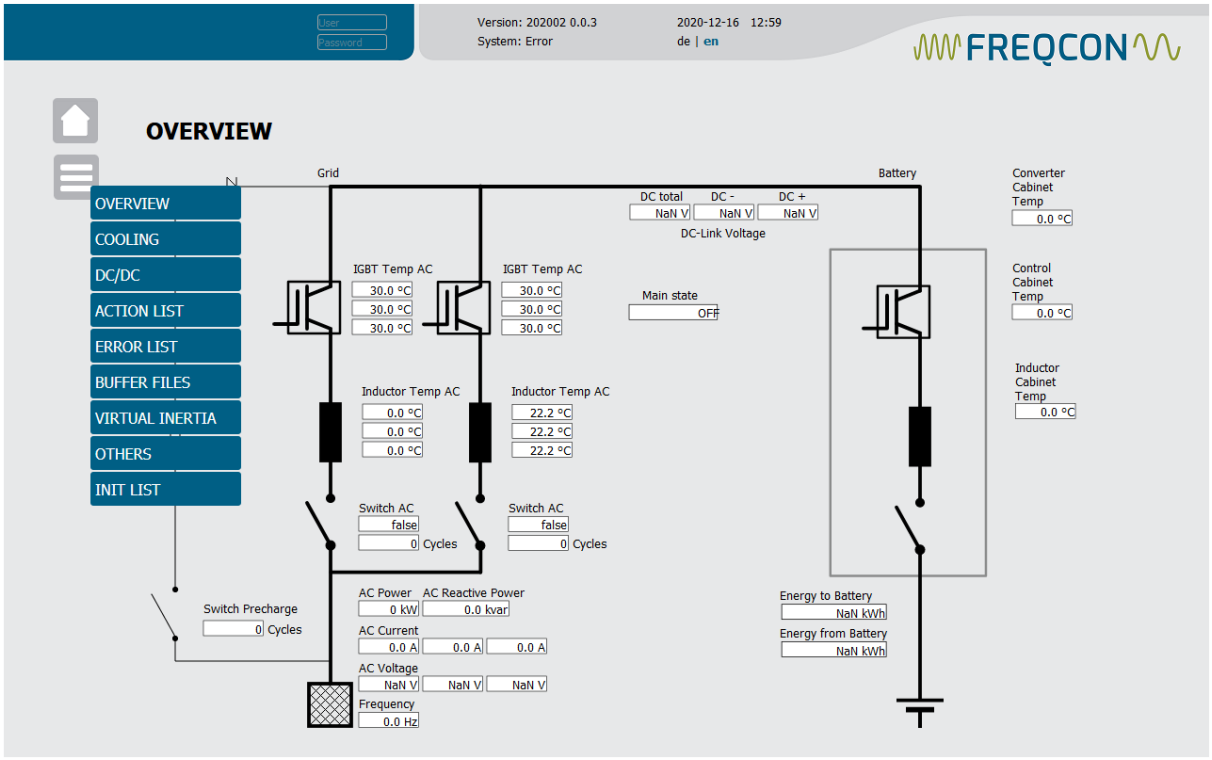
A HMI touch panel is installed at the outside of the control cabinet (CTRL) door. The HMI offers the user granular control, real-time monitoring and visualization of the systems main controller functions. It is also possible, to connect to the HMI via remote connection by a PC or laptop, the so called FREQCON WebVisu.

The HMI/WebVisu provide the following pages:

- Overview
- Cooling
- DC/DC
- Event List
- Error List
- Buffer List
- Initialization

The individual pages can be selected by using the corresponding navigation buttons on the left side of every page.

Note:



- Fields highlighted in grey are command fields for setpoint values. The set values can be adjusted by entering values inside the fields and are acknowledged by pressing “Enter” on the virtual keyboard of the WebVisu.
- White fields are displaying actual values.
- Values must be entered to the fields without any unit.
- The selection of the individual WebVisu pages is dependent of the user rights of the currently logged in user profile.
- When setting the power demand for charging and discharging the batteries “Grid: P demand”:
  Negative sign (-) = batteries are charged / positive sign (+) = batteries are discharged

The following subsections provide example pages of the FREQCON WebVisualisation, providing the possibility of remote monitoring and control of the PCS and BESS system via web browser.

6.5.1 Overview

The “Overview” page provides the user with a graphical overview of the systems main components and visibility to important operating data while the system is in operation.

The converter system is represented using a graphical overview of the system including the AC grid and power port control components. The cooling system and key temperature data will also be shown.

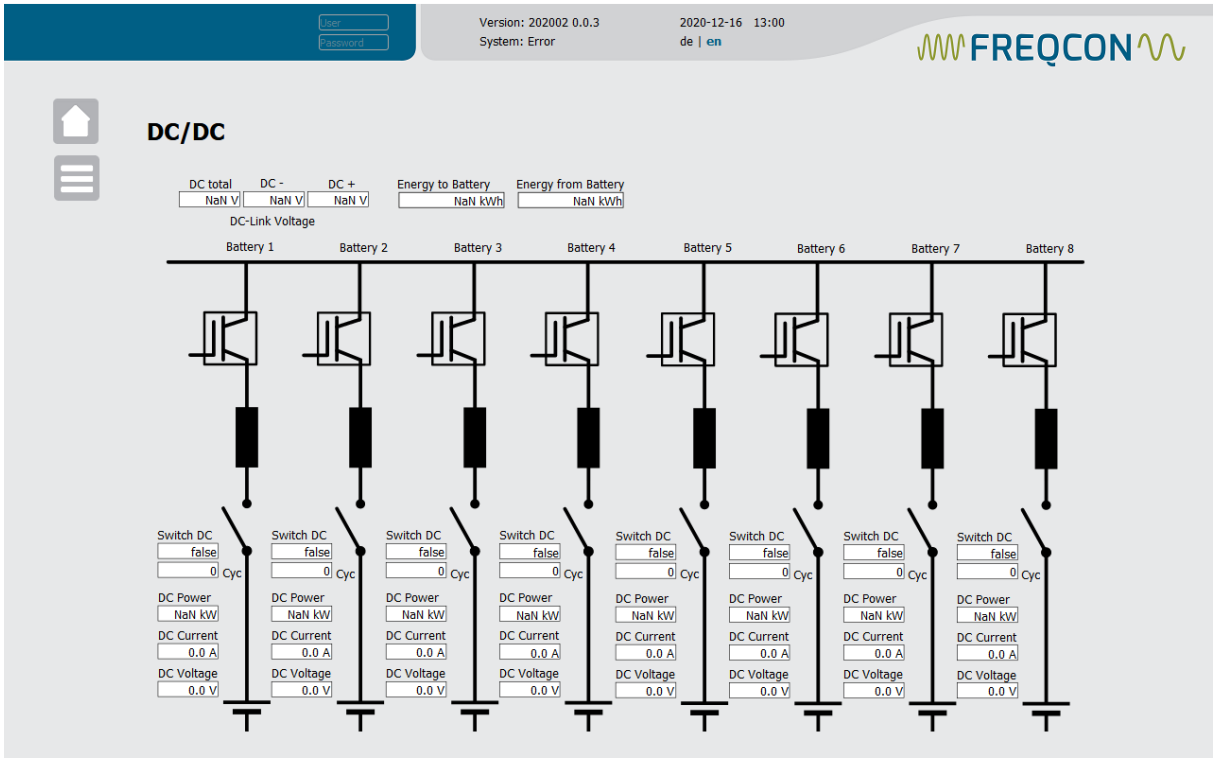
	Description	Value
1	Switching cycles of the precharge switch	Cycle number
2	Mains frequency	Hz
3	AC voltage mains phases L1/L2/L3 against N (from left to right)	V
4	AC current mains phases L1/L2/L3 against N (from left to right)	A
5	AC power (left) / AC reactive power (right)	kW/kvar
6	AC switch switching cycles	Zyklen
7	AC switch switching state	Open / closed
8	Temperatures of the AC chokes 1/2/3	°C
9	Temperatures of the AC IGBTs 1/2/3	°C
10	Temperatures of the AC-IGBTs 4/5/6	°C

11	Temperatures of the AC chokes 4/5/6	°C
12	AC switch switching state	Open / closed
13	AC switch Switching cycles	Cycles
14	Current main state of the converter	
15	Total DC link voltage	V
16	Negative DC link voltag	V
17	Positive DC link voltage	V
18	Temperature inside the converter cabinet (CON)	°C
19	Temperature inside the control cabinet (CTRL)	°C
20	Temperature inside the reactor cabinet (IND_AC)	°C

6.5.2 Cooling

The WebVisu page "Cooling " provide the user with a graphical overview of the main components of the converter cooling system:

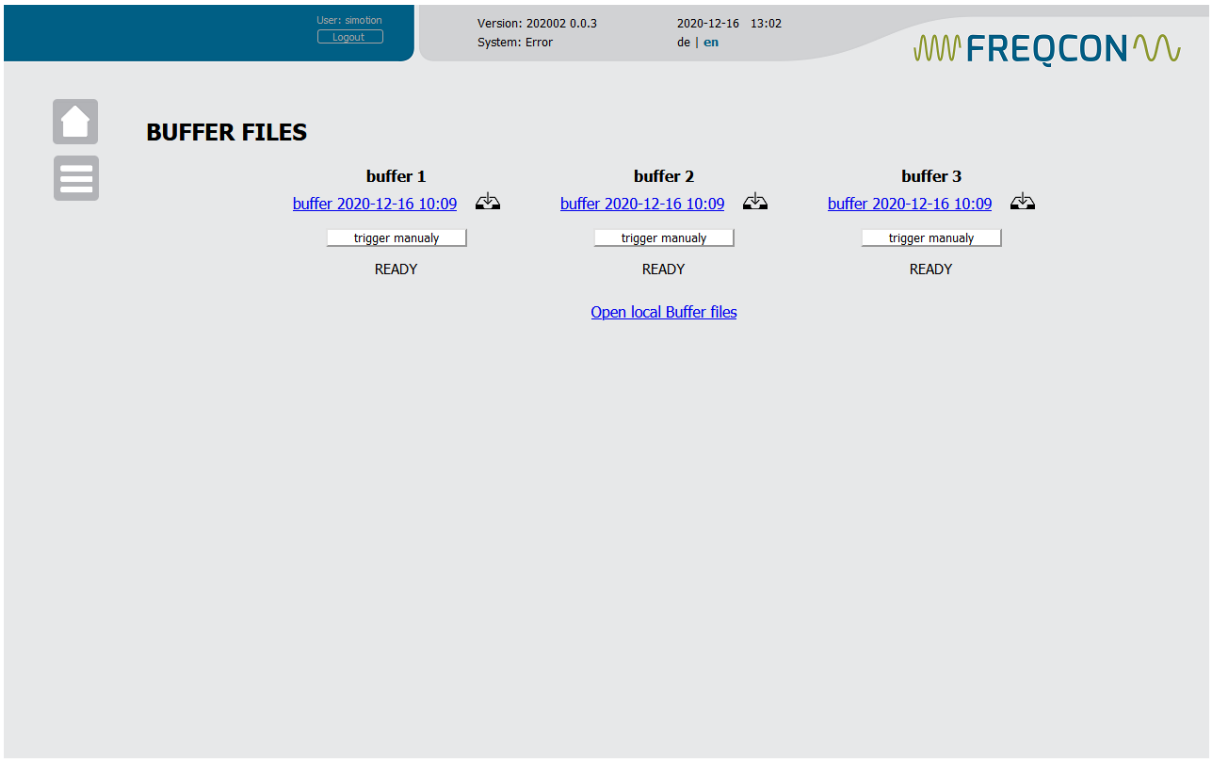
- Cooling water heating element (water heater)
- pressure switch
- Cooling water pump
- Heat exchanger



On the WebVisu page "Cooling" the following actual values are displayed:

	Description	Value
1	Cooling water temperature inside the cooling system	°C
2	Temperatures of the AC IGBTs 1/2/3	°C
3	Temperatures of the AC chokes 1/2/3	°C
4	IGBT temperatures of the DC ports 1/2/3	°C
7	Choke temperatures of the DC ports 1/2/3	°C

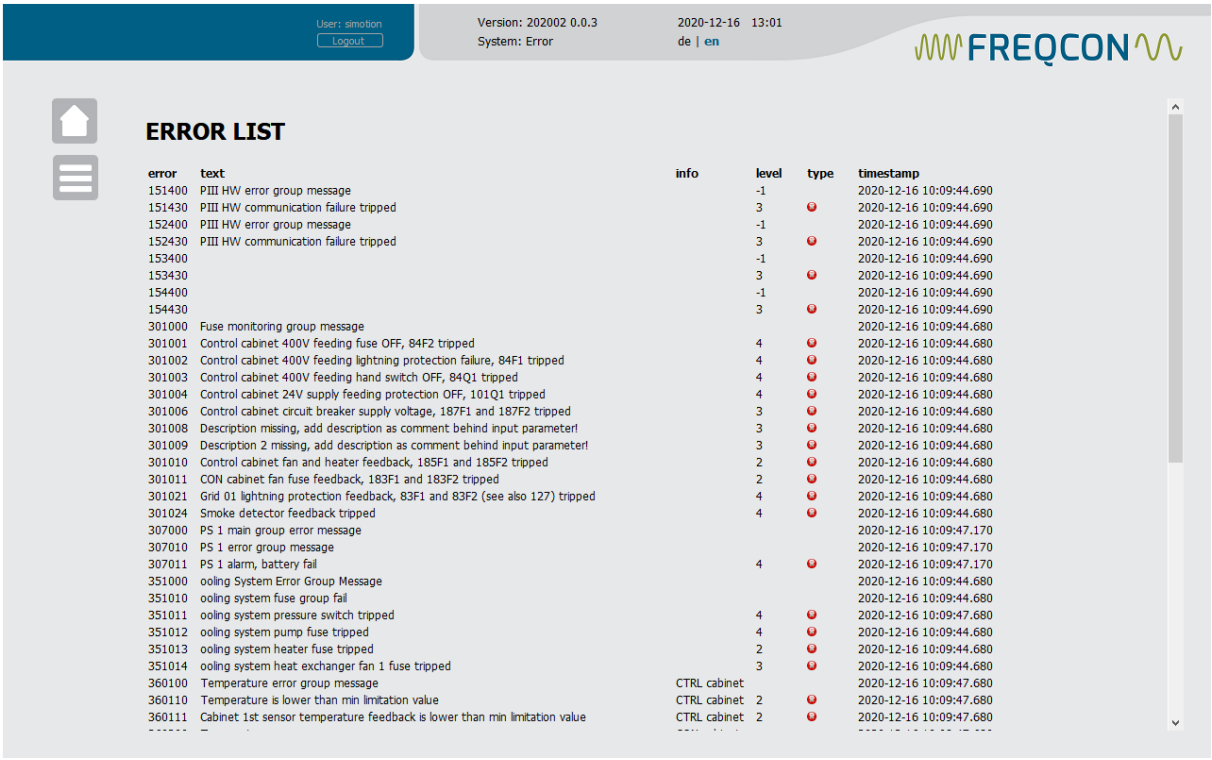
6.5.3 DC Port Page



The WebVisu page "DC/DC" (see figure) provides the user with a graphical overview of the individual DC battery ports of the inverter system and offers information on both the individual DC ports.

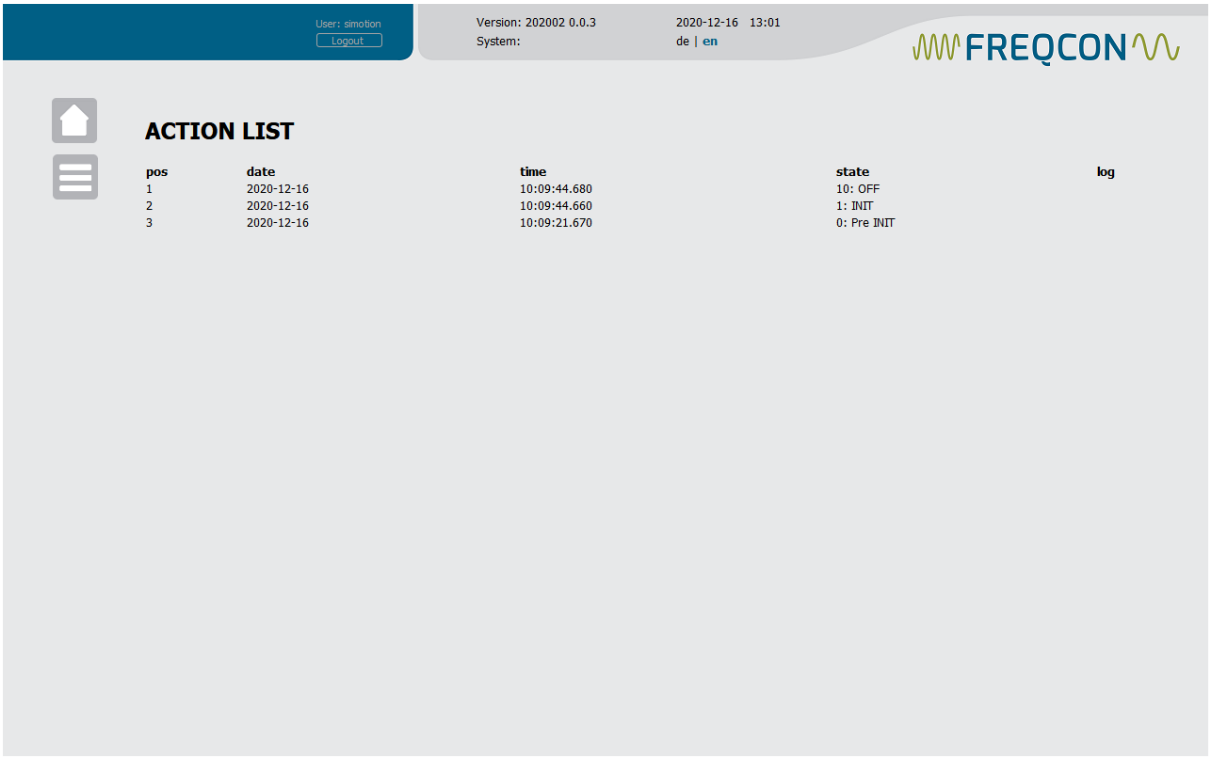
The "DC/DC" WebVisu page displays the following actual values:

	Beschreibung	Wert
1	Total DC link voltage	V
2	Negative DC-Zwischenkreisspannung	V
3	Negative DC link voltage	V
4	Positive DC link voltage	
5	Display of the switching position of the DC switch	Open / closed
6	DC switch switching cycle	Number of cycles
7	Current DC power of the respective battery output	kWh
8	Actual DC current of the respective battery feeder	A
9	Actual DC voltage of the respective battery feeder	V

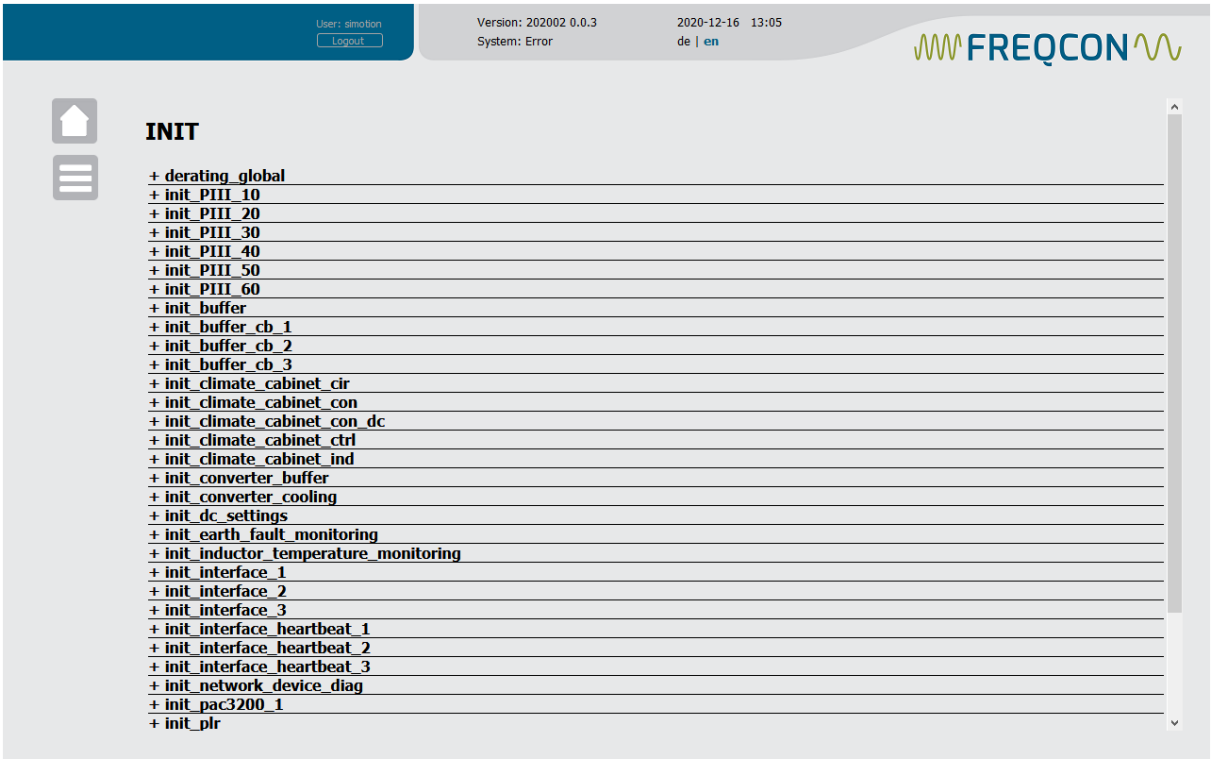


6.6 Buffer Files

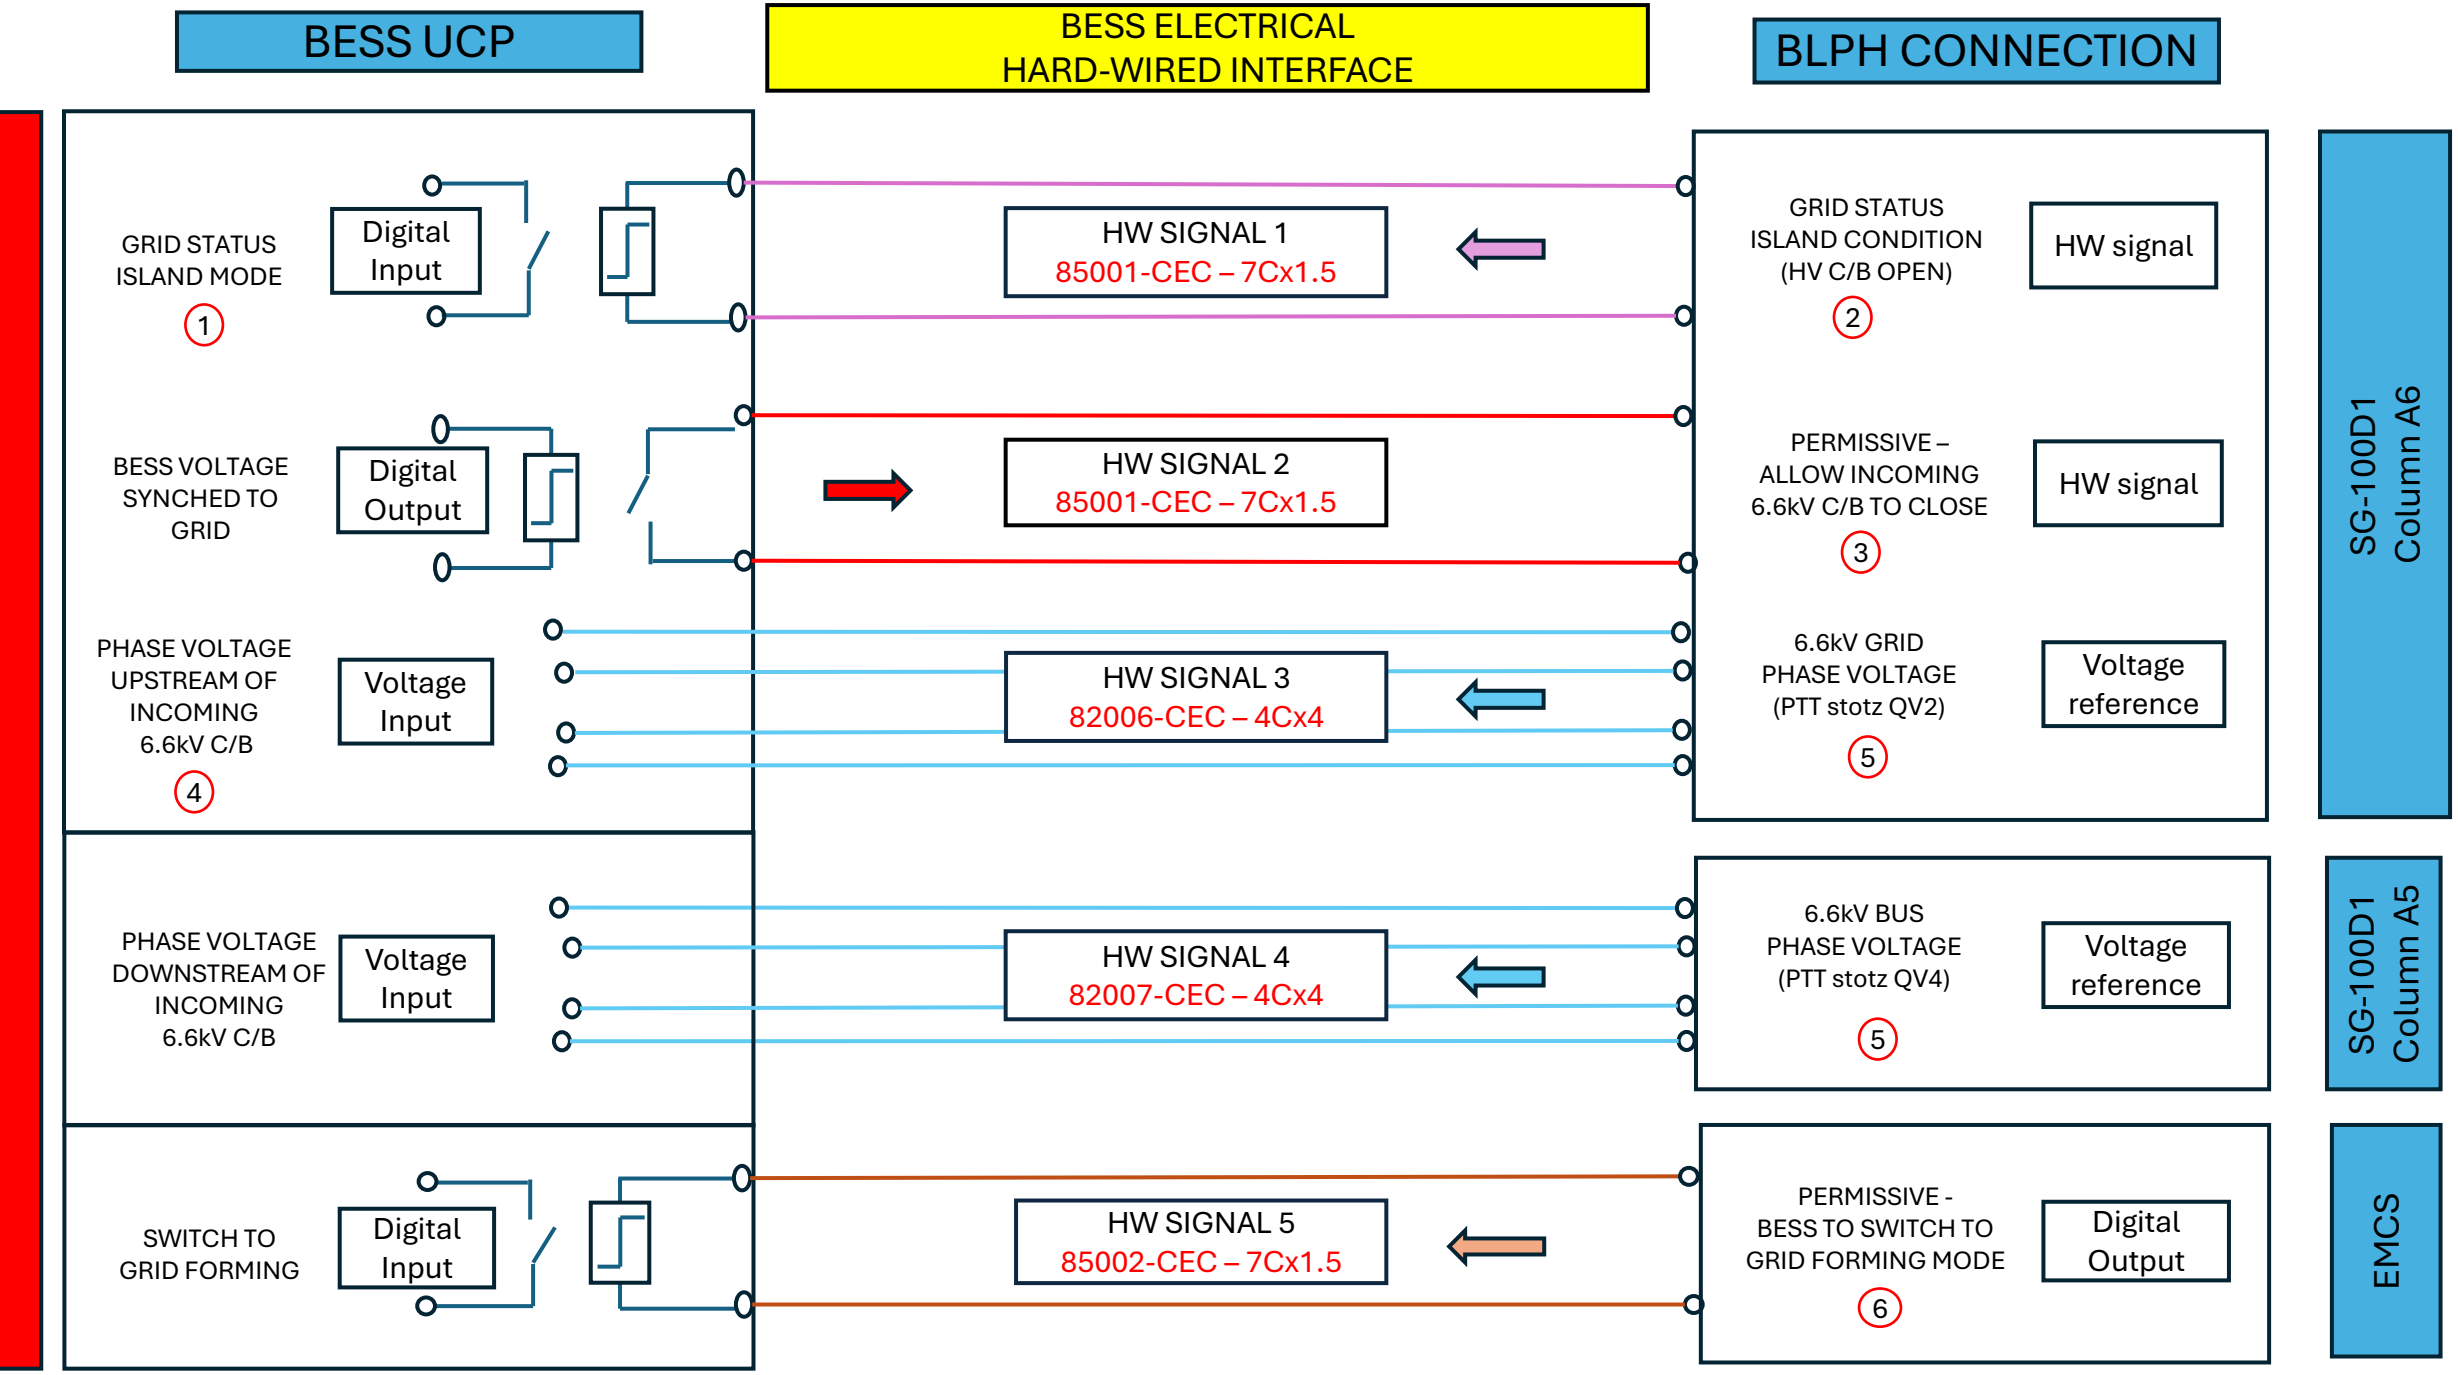
The WebVisu page "Buffer Files" provides the user with downloadable buffer files with performance values from the time when an error occurred. The power values were recorded during a period of 0.75 s before and 0.75 s after the error.



The buffer files are downloadable in .BUF format and can be viewed using the "FREQCON Buffer Analysis" tool. This allows performance values of previous faults to be analyzed.



30 buffer files are stored on the PLC in a loop. If this threshold is exceeded, the oldest buffer is always overwritten with a newer file.



ERROR LIST

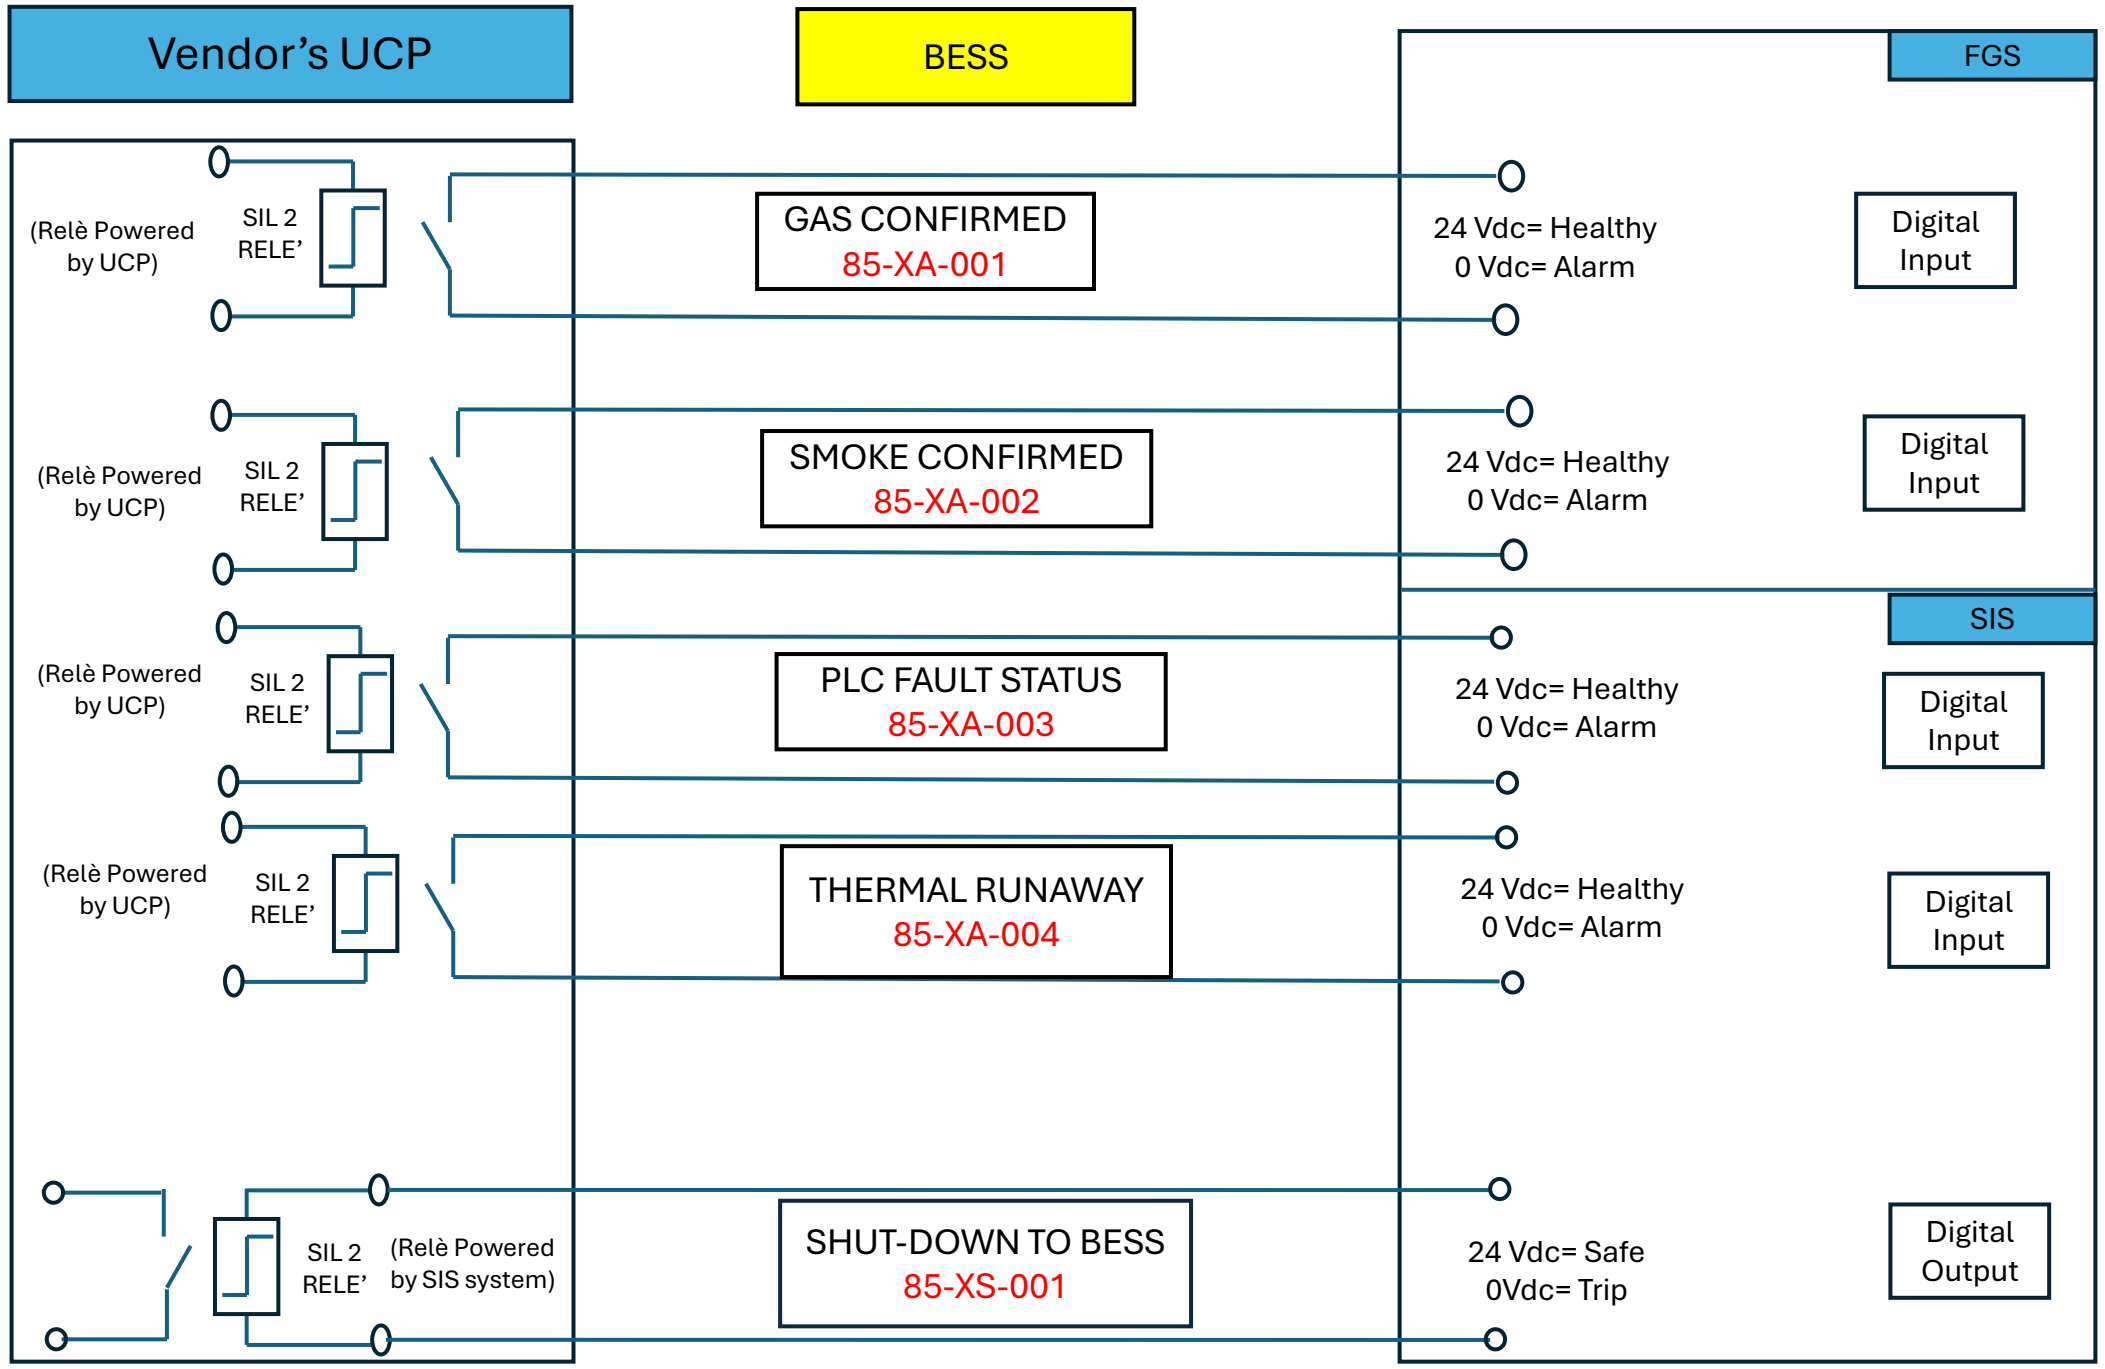
NOTES

1 GRID STATUS ISLAND MODE: 0 = 6.6 kV System is synchronized with the grid and BESS has to operate in grid following
1 = 6.6 kV System is islanded from the grid and BESS has to operate in grid forming IF the permissive is received

2 GRID STATUS ISLAND MODE: the signal is generated as OR of the 66 kV CB open status and the 6.6 kV incoming CB open status as per following scheme



3 PERMISSIVE – ALLOW INCOMING 6.6kV C/B TO CLOSE: This signal is connected as input to the REX 640 protection relay on the 6.6 kV incoming CB in order to close the breaker, provided that the synchrocheck function gives the permissive.
The input BI6 on card D will be used.

4 PHASE VOLTAGE UPSTREAM OF INCOMING 6.6 kV CB: Once BESS read a voltage 110 V on this signal it has automatically to start the synchronization to the grid in order to reach the synchronization and send the permissive to close signal to the incoming CB.

5 VOLTAGES FROM 6.6 kV SWITCHGEAR: These signals are voltage references from secondary side of voltage transformers, so they are at 110 V 50 Hz, with 4 wires.

6 PERMISSIVE - BESS TO SWITCH TO GRID FORMING MODE: This signal will be maintained at 1 until the operator will not reset it manually, in order to prevent the islanding or the automatic return from the island (as per note 4)

Original document

This document is an original document of FREQCON GmbH.

1 Introduction

1.1 About this Document

This document is part of the documentation for the Base Load Power Hub (BLPH) Project (K559-2254). In case of any contradiction resulting by the information or specification given in this document, phase 2 or later documents supersede the information provided in this document.

1.2 Display Elements

Symbol	Meaning
➜	Action with one or several steps for which the sequence is irrelevant.
Step 1 : **Step 2 :**	Action with several steps for which the sequence is relevant.
•	First level of list.
-	Second level of list.

Table 1: Display Elements

1.3 Other Applicable Documents

The following documents are applicable:

Document type	Document Name
BESS and PCS circuit diagram	10354_23A2007_CAE_Statron_Shell Crosswind BESS FQ 1MW 5MWh Offshore_20241105_V1.2

Table 2: Other applicable documents

1.4 Generic Terms and Abbreviations Used

This following list should help you understand some of the abbreviations used in this document.

Generic Term and Abbreviation	Description
BESS	Battery Energy Storage System
BLPH	Base Load Power Hub
PCS	Power Conversion System

Table 3: Generic terms and abbreviations used

2 General

The electrical schematics are attached to this document (*see section 1.3 "Other Applicable Documents"*).

3 Appendix

1. 10354_23A2007_CAE_Statron_Shell Crosswind BESS FQ 1MW 5MWh Offshore_20241105_V1.2

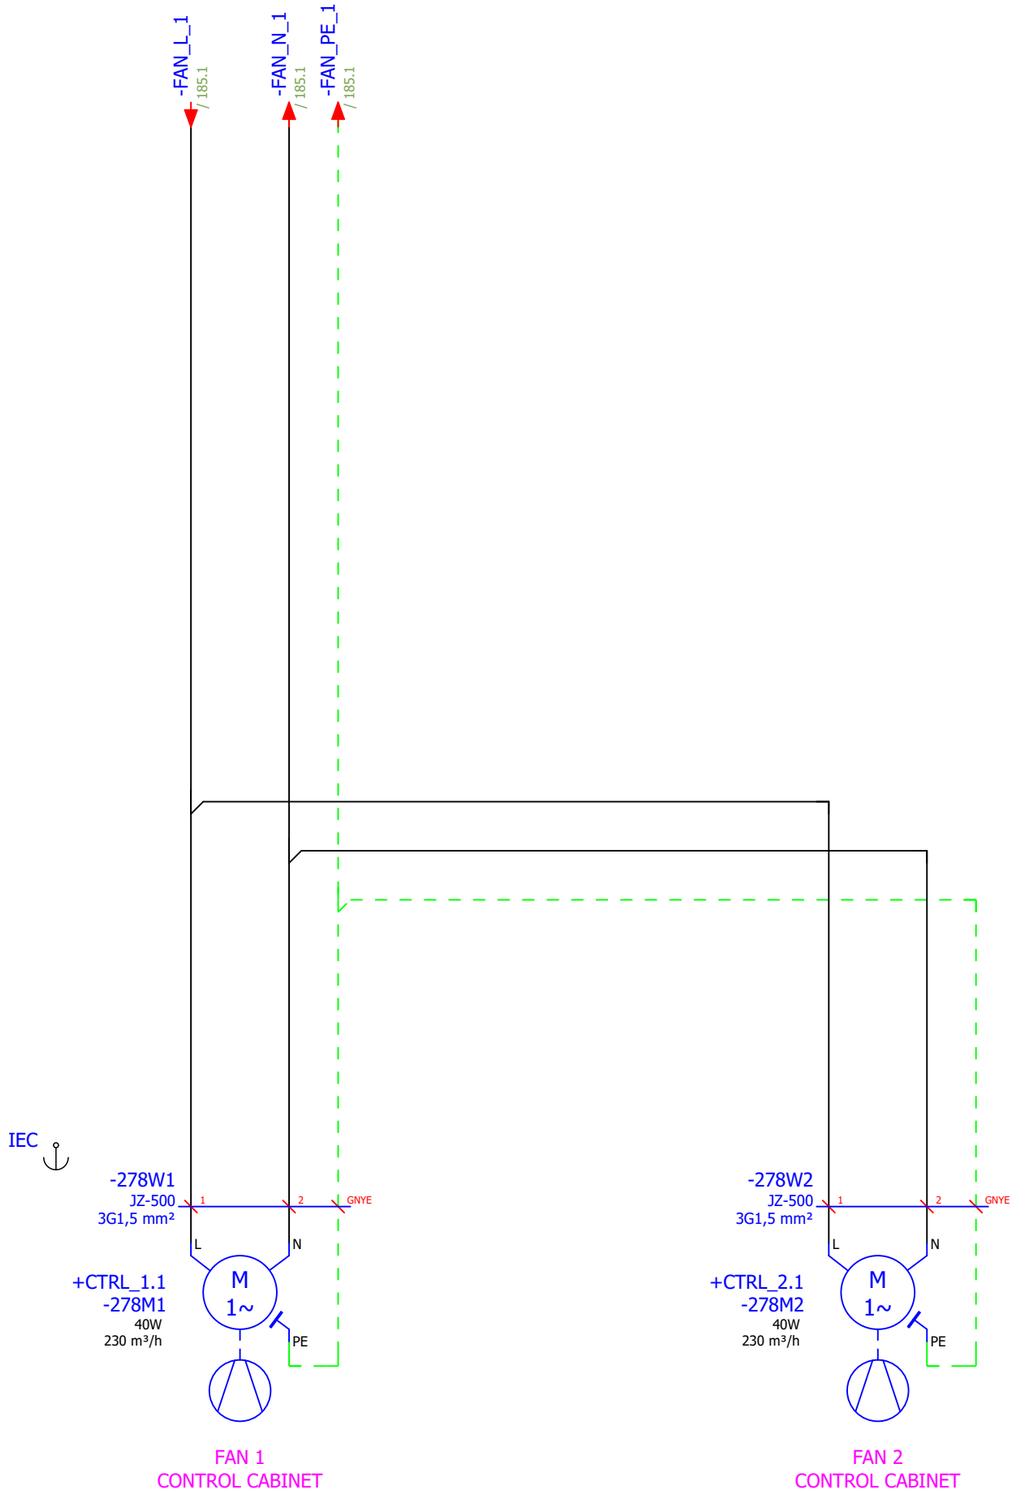
SHUTDOWN CIRCUIT BREAKERS / DC CONTACTORS

FAULT SIGNAL SAFETY RELAY



If the safety relais triggers or a failure is detected, then is the feedback "true".

Note:
The feedback circuit monitors the positions of the positive-guided NC contacts on the contactors 195K1 and 195K2. If one of their contacts latsches, then it is not possible to switch the contactors back on.

SPECIFICATION

TERMINAL STRIP

-XE1	MAIN POWER SUPPLY 600V AC
-XE2	DC POWER SUPPLY 1000V DC
-XE	MAIN POWER SUPPLY 400V AC
-X1	MAIN POWER 400V/230V AC
-X2	LIGHT CABINET 230V AC
-X3	CONTROL VOLTAGE 24V DC
-14X1	CONTROL VOLTAGE 24V DC (TO DC CONTACTORS)
-X5	LOW-VOLTAGE SIGNALS
-XDC0	24V DC POWER SUPPLY
-XDC1-4	CONTROL VOLTAGE 24V DC (UPS)
-XT	TRANSFER TERMINAL BLOCK 24V DC / 230V AC

WIRING COLOR

L1 / L2 / L3	=	BLACK
N	=	LIGHT BLUE (IEC) / GREY (UL)
PE	=	YELLOW-GREEN
EXTERNAL VOLTAGE	=	ORANGE
CONTROL VOLTAGE 24 V DC	=	DARK BLUE
ANALOG SIGNALS	=	WHITE

PLACE

+CTRL	=	Control cabinet
+CON	=	Converter cabinet
+IND	=	Inductor cabinet
+CIR	=	Circuit breaker cabinet
+COSY	=	Cooling System
+FAN	=	External fan

1 Introduction

1.1 About this Document

This document is part of the documentation for the Base Load Power Hub (BLPH) Project (K559-2254). In case of any contradiction resulting by the information or specification given in this document, later documents supersede the information provided in this document.

1.2 Display Elements

Symbol	Meaning
➜	Action with one or several steps for which the sequence is irrelevant.
Step 1 : **Step 2 :**	Action with several steps for which the sequence is relevant.
•	First level of list.
-	Second level of list.

Table 1: Display Elements

1.3 Other Applicable Documents

The following documents are applicable:

Document type	Document Name
Operation Manual	10354_23A2007_250205_Operating_Manual_BESS_1MW_5MWh_6.6kV_EN_v1.2

Table 2: Other applicable documents

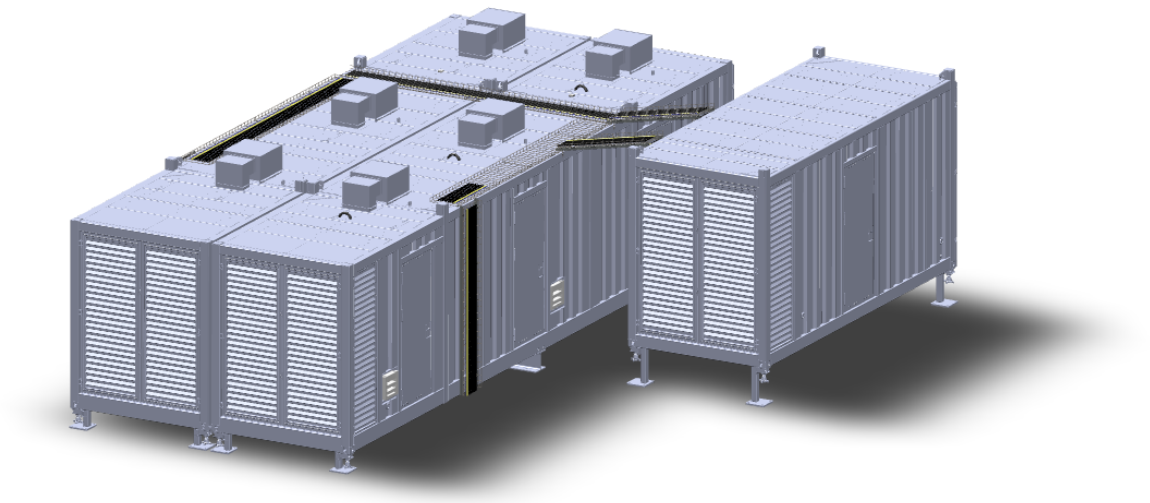
1.4 Generic Terms and Abbreviations Used

This following list should help you understand some of the abbreviations used in this document.

Generic Term and Abbreviation	Description
BESS	Battery Energy Storage System
BLPH	Base Load Power Hub
PCS	Power Conversion System

Table 3: Generic terms and abbreviations used

2 General



The BESS operation manual is attached to this document (*see section 1.3 "Other Applicable Documents"*).

Original document

This document is an original document of FREQCON GmbH.

1 About these Instructions

This manual is part of the product and applies exclusively to the system described in this document.

This operating manual contains the necessary information for the proper use of the described system. The operating manual is supplied together with the product and is considered as an important part of the product.

Please read this manual carefully, as it contains important information on the installation and operation of the product.
Please pay particular attention to the notes regarding the safe use of the system.
The manufacturer accepts no liability for any damage caused by failure to observe these instructions.

Keep this manual and provide it to the new owner in case of a change of the operating company.
All personnel who have any relation of handling or operating the product must always have direct access to this manual.

All personnel who have any relation of operating the unit are obligated to read all related manuals regarding the system described in this document. The employed personnel must declare that they have fully read and understood all contents of the manuals and agree to follow all instructions, especially issues regarding safety and accident prevention.

Additional Documents

The instructions of this operating manual must be supplemented with the necessary, customary local and current accident prevention regulations, environmental protection rules and laws.

Location of the Manual

Always keep this manual within direct reach when operating or handling the unit. The operator must have direct access to the manual. The operator must have direct access to the manual.

Display Elements

Symbol	Significance
➜	Action with one or several steps for which the sequence is irrelevant.
Step 1 : **Step 2 :**	Action with several steps for which the sequence is relevant.
•	First level of list.
-	Second level of list.

1.1 Disclaimer of Liability

The contents of this publication have been reviewed to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, any necessary corrections are included in subsequent editions.

1.2 Applicable Documents

The delivery scope of the product includes the following documents:

Document	Document Name

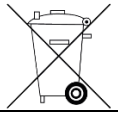
1.3 Abbreviations

The following list provides descriptions about the generic terms and abbreviations used in this document:

Generic Term and Abbreviation	Significance
AC	Alternating current
Identifier	Equipment labeling
BESS	Battery Energy Storage System
BMS	Battery management system
BSU	Blackstart unit
DC	Direct current
DC-link	Direct current link
EMC	Electromagnetic compatibility
EMF	Electromagnetic fields
EMS	Energy management system
FRQ	FRFEQCON GmbH
HMI	Human-Machine Interface
HV	High voltage



HVIO	High Voltage I/O Module
MB	Modbus
RTU	Remote Terminal Unit
TCP	Transmission control protocol
MSC	Multi-Source Converter
MV	Medium voltage
LFP	Lithium iron phosphate
LV	Low voltage
PCS	Power conversion system
PLC	Programmable Logic Controller
PPE	Personal safety equipment
IGBT	Insulated-Gate Bipolar Transistor
IEC	International Electrotechnical Commission
I/O	Input/output
IP	Internet protocol
SoC	State of charge
TR	Thermal runway
UPS	Uninterruptable power supply

Table 4: List of Abbreviations

1.4 Warning Symbols

Observe the warning symbols in this document and those attached on the device. The warning symbols have the following meaning:

Symbols	Significance
	Hazard (general)
	Hazard by voltage
	Hazard by high temperature
	Hazard by batteries
	Hazard by fire
	Maintenance lockout tagout, do not switch!
	Acute toxicity (oral, dermal, inhalation) (hazard. category 4)
	Respiratory sensitization (hazard category 1, 1A and 1B)
	Prohibition for people with pacemakers

	Hazard by heavy load
	Do not dispose in household waste. (See section 24 “Dismantling and Disposal”)

1.5 Information Symbols

Symbol	Significance
	Important technical information for this product

1.6 Warning Levels / Signal Words

DANGER	Indicates a hazardous situation which, if not avoided, will result in death or serious injury.
WARNING	Indicates a hazardous situation which, if not avoided, could result in death or serious injury.
CAUTION	Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury
NOTICE	Indicates that property damage can result, if proper precautions are not taken.

1.7 Target Groups

⚠ DANGER	
	**Danger from and for unauthorized persons** Unauthorized persons are not aware of the dangers in the work area and may endanger themselves and third parties. ➜ Keep unauthorized persons away from the work area. ➜ If in doubt, speak to persons and direct them away from the work area. ➜ Interrupt the work as long as unauthorized persons are in the work area. ➜ Always keep the entrance door(s) locked when not performing work on the system to prevent unauthorized persons from entering the container.

Group	Significance
Operator	• Uses the product himself for commercial or economic purposes or lets a third-party use/apply it. • During operation, bears legal product responsibility for the protection of the user, personnel and third parties. • May not open control cabinets and/or perform maintenance.
Trained person	• Has been demonstrably trained and instructed by the operator about the assigned tasks and possible dangers in case of improper behavior. • Is authorized to operate the plant. • May not open control cabinets and/or perform maintenance.
Service Personnel	• FREQCON GmbH service personnel • Personnel trained and authorized by FREQCON and authorized specialist personnel. • Carries out all other work on the plant, e. g. commissioning, maintenance work, transport, and troubleshooting.
Manufacturer	• Person who was/is involved in the development of the energy storage system and has detailed knowledge of the structure and function of the modules or the entire system - in accordance with the relevant specialist area.

Table 5: Target groups

2 Safety Instructions

2.1 The Five Safety Rules

For your own personal safety and to prevent material damage when carrying out any work, always observe the safety-relevant instructions and the following five safety rules according to EN 50110-1 "Working in a voltage-free state".

2.2 Basic Safety Information

Do not operate!	**Lock and tag power switches and controller devices**
	Follow national laws regarding occupational safety and health. ➜ Identify the energy source(s). ➜ Isolate the energy source(s). ➜ Determine voltage-free status. ➜ Ground device or equipment to protect from short circuiting and from shocks. ➜ Lock and Tag the energy source(s). ➜ Prove that the equipment isolation is effective. ➜ When required, apply lock-out device or clamp and secure with padlock(s).

Important!	
	➜ Read the instructions of this manual thoroughly before use! ➜ Keep manual within reach. ➜ All personnel who have to perform any task on the BESS (on-site or remotely) with respect to operation of the unit are obligated to read all related manuals regarding the BESS. By proceeding with work on the BESS, the personnel declare that they have fully read and understood all contents of the manuals and agree to follow all instructions, especially issues regarding safety and accident prevention.

⚠ DANGER	
	**Hazard by voltage** Always respect all the safety instructions and, in particular: ➜ Always use protective devices suitable and approved for each type of activity. ➜ The instructions in this manual must be strictly followed. ➜ Use of the equipment must comply with all national and local regulations. ➜ Access to internal components is only allowed after the converter has been de-energized and disconnected from all power supplies.

⚠ DANGER	
	**Hazard by voltage** ➜ Electric shock hazard. ➜ Only electricians may perform work on electrical components. ➜ Do not touch live components! ➜ Disconnect the device from all power supplies, before performing work on the device. ➜ Do not short circuit any conductive parts that are not de-energized before. (Take care with jewellery, tools, instruments, etc. which can cause short circuits accidentally.)

⚠ DANGER	
	**Hazard by voltage** ➜ Before opening the cabinet doors de-energize the converter. ➜ Even if the main circuit breaker is switched off, the cabinets are not completely voltage-free.

⚠ DANGER	
	**Risk of burns on hot surfaces** ➜ Avoid contact with hot surfaces or wear protective clothing (e.g. protective gloves).

⚠ DANGER	
	**General risk of injury due to improper handling** ➜ Only perform work on the device if you have expert knowledge of the respective activity. ➜ Follow the operating instructions and warnings stated in this manual.

⚠ DANGER	
	**Electric shock hazard!** **Do not perform maintenance work on a live system.** After switching off the converter, the DC-link of the converter still carries dangerous voltages, which may cause death or severe injuries if touched or short circuit. ➜ Before performing work on the converter, deenergize the converter, wait for 30 minutes until the installed capacitors are discharged and check the voltage-free status of the DC-link by using a 2-pole voltage tester. ➜ It is not allowed to open the cabinet doors before the converter system has been de-energized and the capacitors are discharged. ➜ It is not allowed to perform any work on the converter before the system has been de-energized.

⚠ DANGER	
	**Electric shock hazard!** **Do not perform maintenance work on the converter system, before the converter system has been disconnected from all power sources.** After switching off the converter, the connected DC power cables of the battery strings, the DC connection busbars in the AC_DC cabinet and the DC switch & fuse units continue to carry dangerous voltages that can cause death or serious injury if touched or short-circuited. ➜ Before starting work inside the converter cabinets, de-energize the converter system as described in section 14.6 “De-Energizing”, wait for 30 minutes until the installed capacitors are discharged and check the voltage-free status of the DC-link by using a 2-pole voltage tester. ➜ Disconnect the DC power cables from the converter system using suitable DC disconnecting devices before carrying out any work in the cabinets of the converter system. ➜ Before disconnecting the DC power cables from the DC connection busbars, always check for voltage-free status of the DC power cables, since dangerous electric arcs may lead to severe injuries or death when disconnecting the power cables.

⚠ DANGER	
	**Electric shock hazard!** **Do not perform any work on the MV switchgear and the MV transformer before the PLC container has been disconnected from all voltage sources.** After switching off the converter, the connected MV transformer, the MV switchgear, its connecting cables and terminals continue to carry dangerous voltages which, if touched or short-circuited, can cause death or serious injury. ➜ Before working on the medium voltage components of the converter container, de-energize the converter system as described in section 14.6 “De-Energizing”. ➜ Disconnect the AC mains connection by opening the MV switchgear. ➜ Before disconnecting the AC power cables from the AC connection busbars, always check the voltage-free status of the AC power cables, otherwise dangerous arcs can cause serious injury or death when disconnecting the power cables.

⚠ DANGER	
	**Electric shock hazard!** **Do not perform any maintenance work on the converter system before the AC circuit breaker and MV switchgear have been switched off and protected against unintentional reclosure.** ➜ Before starting work inside the converter cabinets, the AC circuit breaker 80Q1 must be switched off and protected against unintentional reclosure as described in section 14.8.3 “Protect the CB Against Unintentional Reclosing”. ➜ Before you start working inside the control cabinets, the medium-voltage switchgear must be switched off and protected against unintentional reclosure.

⚠ DANGER	
	**Danger to life through electric arcs** Danger by electric arcs could occur by: • Exceedance of the maximum input current • Faulty design of circuit breakers or transformers • Faulty or not connected cables • Excessive contamination Electric arcs may lead to death, severe injuries or material damage. ➜ Make sure the system is properly designed and all power cables are connected correctly. The maximum permissible input current is provided in the table "Technical Data". ➜ Excessive contamination must be removed.

⚠ DANGER	
	**General risk of injury due to improper handling.** Always respect all the safety instructions and, in particular: ➜ Always use protective devices suitable and approved for each type of activity. ➜ The instructions in this manual must be strictly followed. ➜ Use of the equipment must comply with all national and local regulations. ➜ Access to internal components is only allowed after the converter has been de-energized and disconnected from all power supplies. ➜ It is not allowed to perform work on a live converter. ➜ The converter and all connected systems/components must be electrical grounded properly. ➜ All installation work and maintenance on the BESS must be carried out by qualified personnel. ➜ Improper use or handling of the BESS during transportation, installation or during operation may result in damage to the equipment or cause severe, even fatal injury. ➜ Maintenance work on the converter unit must be performed with reasonable care. ➜ Non-compliance with the present instructions may cause damage to the product and could lead to serious injuries of the personnel.

⚠ DANGER	
	**Danger to life when live parts are touched on damaged devices** Improper handling of devices can cause damage. For damaged devices, hazardous voltages can be present at the enclosure or at exposed components. If touched, this can result in death or severe injury. ➜ Ensure compliance with the limit values specified in the technical data during transport, storage and operation. ➜ Do not use any damaged devices.

⚠ DANGER	
	**Danger to life through electric shock due to unconnected cable shields** Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields. ➜ As a minimum, connect cable shields and the conductors of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ DANGER	
	**Danger to life due to electric shock when not grounded** If the protective conductor connection is missing or incorrect, high voltages can occur at open, exposed parts when using devices of protection class I. Touching these parts can result in death or serious injury. ➜ Ground the device in compliance with the applicable regulations.

⚠ DANGER	
	**Danger to life due to electric shock when opening plug connections in operation** When opening plug connections in operation, arcs can result in death or severe injuries. ➜ Only open plug connections when the equipment is de-energized, unless it has been explicitly stated that they can be opened in operation.

⚠ DANGER	
	**Danger to life through electric shock due to the residual charge of the power component capacitors** Due to the use of capacitors, a dangerous voltage is present even up to 5 minutes after the power supply has been switched off. Contact with live parts can result in death or serious injury. ➜ Wait for 5 minutes and then check the de-energized state of the system. Only then should you start working on the device.

⚠ DANGER	
	**Danger to life from electromagnetic fields** Electromagnetic fields (EMF) are generated by the operation of electrical power equipment, such as transformers, converters, or motors. People with pacemakers or implants are at particular risk in the immediate vicinity of this equipment. ➜ If you have a heart pacemaker or implant, maintain a minimum distance of 2 m from electrical power equipment.

⚠ DANGER	
	**Danger to life when safety functions are inactive** Safety functions that are inactive or that have not been adjusted accordingly can cause operational faults on machines that could lead to serious injury or death. ➜ Observe the information in the appropriate product documentation before commissioning. ➜ Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components. ➜ Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing. ➜ Perform a function test. ➜ Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

⚠ DANGER	
	**Danger to life due to fire if overheating occurs because of insufficient ventilation clearances** Inadequate ventilation clearances can cause overheating of components with subsequent fire and smoke. This can cause severe injury or even death. This can also result in increased downtime and reduced service lives for devices/systems. ➜ Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

⚠ DANGER	
	**Danger of an accident occurring due to missing or illegible warning labels** Missing or illegible warning labels can result in accidents involving death or serious injury. Check that the warning labels are complete based on the documentation. ➜ Attach any missing warning labels to the components, in the national language if necessary. ➜ Replace illegible warning labels.

⚠ WARNING	
	**Hazard by hot surfaces of components** During operation, some components may heat up significantly, e.g. heat sinks and inductors. These components can still be very hot for some time after operation. In case of contact, severe bodily injuries, such as skin burns, may result. ➜ Do not touch hot surfaces even after shutdown of the converter system.

⚠ WARNING	
	**Danger to life or malfunctions of the BESS as a result of incorrect or changed parameterization** As a result of incorrect or changed parameterization, the system can malfunction, which in turn can lead to injuries or death. ➜ Protect the parameterization (parameter assignments) against unauthorized access. ➜ Respond to possible malfunctions by applying suitable measures (e.g. EMERGENCY STOP or EMERGENCY OFF).

⚠ WARNING	
 	**Hazard by cooling liquid** The coolant used in the internal cooling system of the converter is harmful to human or animal health when touched or swallowed. ➜ Avoid oral ingestion of the coolant since it can lead to harm to human or animal health. In case of accidental ingestion or eye contact with the coolant, seek immediate medical attention. ➜ Avoid skin contact with the coolant. ➜ Use appropriate eye protectors and protective gloves when working on the cooling system and during filling and draining of the cooling liquid.

⚠ CAUTION	
	**Hazard by sharp edges on packaging** Improper handling during unpacking can cause injuries. ➜ Use appropriate safety gloves to protect your hands from possible cuts.

NOTICE	
	**Material damage due to loose power connections** Insufficient tightening torques or vibrations can result in loose electrical connections. This can result in damage due to fire, device defects or malfunctions. ➜ Tighten all power connections with the specified tightening torques, e.g. grid supply connection. ➜ Check all power connections at regular intervals. This applies in particular after transport.

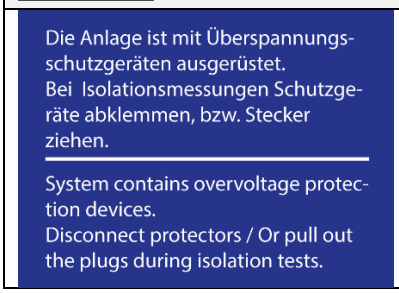
NOTICE	
	**Device damage caused by incorrect voltage/insulation tests** Incorrect voltage/insulation tests can damage the device. ➜ Before performing voltage/insulation tests on the equipment, disconnect all equipment as high voltage tests have been performed on inverters and motors by their manufacturers. Therefore, it is not necessary to perform a retest on the system.

NOTICE

Material damage due to overloading of DC devices and connecting cables

The DC paths and the connection cables are not protected against overload by the BESS.

Select external components according to the specified nominal and maximum currents of the BESS.



➜ If necessary, use appropriate protective equipment for the external components.

NOTICE

Material damage due to improper use of the transformer

For your safety, carefully read the delivered operating instructions of the transformer and observe the instructions. Technical specifications of the transformer which are provided on its´ type plate like rated current, rated power etc. must be strictly observed when commissioning and feeding power to the grid. All electrical connection work must be carried out onsite and by trained, qualified personnel, provided with the required safety devices in accordance with the national occupational safety regulations. Please pay attention to the proper protection of the transformer during unloading, installation at the place of operation, feeding and operation The transgression of the voltage or power and the presence of external factors (such as condensation, solar radiation, plants and animals) can affect the proper functioning of the transformer).

NOTICE

General risk of damage

During isolation tests disconnect overvoltage protection devices or pull out the plugs otherwise they will be activated or destroyed.

2.3 Safety Instructions Battery Storage Unit

⚠ DANGER	
	**Hazard by electrolyte** Work on the battery storage system is only allowed to be performed by FREQCON service personnel or qualified personnel trained and authorized by FREQCON. It is not allowed to modify or manipulate the battery storage unit and its components. ➜ Do not open, disassemble or puncture the battery storage cabinets or battery modules. ➜ Do not short circuit the battery storage unit. ➜ Do not expose the battery storage system to vibrations or shock. ➜ Do not a use defective or damaged battery storage system or battery modules. ➜ Do not touch defective or damaged batteries with bare hands. Defective or damaged batteries must only be handled by FREQCON personnel.

⚠ DANGER	
	**Hazard by electrolyte** The material/media required for intended operation of the battery storage system are procured and provided by the manufacturer. ➜ The proper handling of these materials/media and the associated risks underly the sole responsibility of the manufacturer. ➜ Hazard and disposal information must be provided by the manufacturer. ➜ The safety data sheets of the material and media manufacturers are to be observed.

⚠ WARNING	
	**Health hazards due to negligent use of personal protective equipment** Serious injuries can occur when working without personal protective equipment. ➜ Wear personal protective equipment (PPE) when working on the BESS. Refer to section 2.7 "Personal Protection Equipment (PPE)" for information regarding the required PPE.

⚠ WARNING	
	**Possible danger to life due to electric shock when extinguishing fire or due to flooding!** If the following instructions are not observed, this can lead to damage to property and personal injury, for which FREQCON GmbH accepts no liability whatsoever. ➜ In the event of a fire, switch off the battery storage system if safe to do so. ➜ Immediately alert the fire department. ➜ Immediately remove yourself and other persons from the danger zone. ➜ Inform the fire department about the presence of lithium iron phosphate batteries.

⚠ CAUTION	
	**Danger due to fire breaking out** During operation, fire may break out, e.g. due to sparks or heated surfaces. ➜ Observe the relevant safety regulations (5 safety rules). ➜ Note the risk of arcing when operating the NH isolators installed inside the battery storage cabinets. ➜ Never install or operate a potentially defective or obviously defective battery storage unit.

⚠ CAUTION	
	**Hazard by burns (electric arcs)** When working on the electrical equipment, you may come into direct contact with faulty or overloaded parts which can cause burns. ➜ Always observe the relevant country-specific safety regulations. ➜ Note the risk of arcing when operating the NH isolators installed inside the battery storage cabinets. ➜ Note the risk of arcing when operating the NH isolators installed inside the battery storage cabinets.

2.3.1 Safety Data Sheet

Observe the information provided in the Material Safety Data Sheet (MSDS) of the battery cells (*see section 1.2 "Applicable Documents"*).

2.3.2 Personal Protection

This chapter describes the personal protection for FREQCON battery converter systems in the event of fire or the occurrence of a toxic gas concentration.

Basic safety measures

- No person may remain inside the container or in the safety area of the container while the system is in operation.
- All container doors must be locked while the system is in operation.
- Maintenance and repair work may only be carried out when the system is switched off and all energy sources are disconnected from the system.

Critical situation regarding personal safety

A person enters the container for maintenance/repair work in which there is a fire (risk of deflagration when opening the container door) or a toxic concentration of carbon monoxide due to outgassing batteries.

Definition of the protection objective

Under all circumstances, a person must be prevented from entering the container if the critical situation mentioned before exists.

Technical measures to achieve the protection objective

- Reliable detection of a fire or toxic gas concentration using suitable sensors (smoke detectors, CO sensors, temperature sensors).
- The sensors are redundant. Smoke detectors, CO sensors and temperature sensors are installed in each battery room.
- One H2 sensor is installed inside each battery room of the BESS containers.
- If the system is shut down by emergency shutdown, no person may enter the container.
- If a hazardous situation exists, an infrared thermometer must first be used to check whether there is a fire in the container. A temperature above 60 °C is a sure sign of a fire inside the container. If this is the case, the container doors must not be opened (risk of deflagration) and the fire brigade must be alerted.
- If a fire can be ruled out as the cause of the emergency shutdown, a toxic gas concentration could be present. Entering the container is not permitted in this situation. Active ventilation (exhaust units in the BESS container roof) reduces the gas concentration in the container.

2.3.3 Fire Fighting Measures

1) Fire protection / early fire detection
   a. Spatial conditions:
      Primarily through the structural measure; Space between modules, air conditioning and ventilation reduces the risk of thermal stress to a minimum
   b. It must be ensured that there is no additional fire load in the battery rooms. Unauthorized access must be strictly prevented.
   c. Sensors for detecting smoke, heat and CO gas are redundantly built into the alarm system.
   d. At 300 °C automatic fire suppression using an aerosol mist triggers itself.

Important: Extinguishing an internal cell fire is not possible. Due to the chemical release of bound oxygen in the cathodes, the fire inside the cell sustains itself. The aerosol extinguishing system is intended to prevent the flames from spreading to the outer surroundings of the battery module!

2) Behavior in case of fire
   a. Upon detecting a fire in the battery room, the battery container is immediately and automatically disconnected from the grid. The circuit breaker opens its contacts to prevent any further external energy supply.
   b. Toxic and hazardous substances are released by the battery in the event of a fire.
      Harmful gases include:
      Hydrogen (H_2) 48%
      Carbon dioxide (CO_2) 27%
      Carbon monoxide (CO) 11%
   c. Remove all persons from the danger area.
   d. Clear affected area and secure from entry.
   e. Disconnect all supply voltages of the BESS at the disconnection points of the external voltage sources.
   f. Only start active measures in the event of visible flame development outside the energy storage unit.
   g. Do not enter any electrolyte cloud that may form in the external area (near the floor).
   h. Wait at least 48 hours before starting firefighting measures inside the container. First open the access door and wait another 2 h.

⚠ DANGER	
	**Poisoning and chemical burns hazard** Escaping electrolyte gases contain chemicals which are harmful to humans. ➜ Keep away from electrolyte mist clouds. ➜ Approach electrolyte mist clouds only under full protection. ➜ Observe the instructions in the Material Safety Data Sheet of the battery cells *(see applicable documents)*. ➜ Follow the following instructions

3) Recommendation for rescue units

   Firefighting should be conducted according to regional standards and guidelines.
   (EN 15182-1:2019-11).
   The distance for the fire hose nozzle must be maintained.

Ensure full protective gear according to DGUV Information 205-014 (e.g. DIN EN 469 ; Protective clothing for the fire brigade - performance requirements for protective clothing for fire brigade activities) and recirculating air independent respirator is worn.
For firefighting protective equipment, thermal risk is given more priority than chemical hazard.

4) Instructions after fire extinction

Once the fire brigade has cleared the fire site and the fire has been extinguished, an electrically trained specialist must immediately ensure and verify the absence of voltage (measure all poles) and secure against re-energization.
5 safety rules!
Attention: Batteries continue to maintain voltage even after disconnection!
In addition, ventilate the rooms adequately to eliminate any remaining hazardous fire gases.
According to the technical data sheet, the battery modules must be stored/disposed.

Rules of Conduct for the Fire Brigade

The following notice board must be kept outside the container or handed over to the local fire department. A laminated copy is included in the scope of delivery.

Rules of conduct for the fire brigade

Attention electrical voltage!

Batteries are still live after disconnection!!!

Batteries can outgas when heated

CO = carbon monoxide
H2 = Hydrogen

Unauthorized access is strictly prohibited.

Keep doors closed in case of fire

The use of respiratory protection is strongly recommended

Battery fire cannot be extinguished!

Container cooling from outside

Extinguishing agents: water

2.3.4 Disposal Considerations

Lithium-ion cell batteries are labeled in compliance with the EU Battery Directive 2006/66/EC.

For instructions regarding the disposal of the battery storage system and its battery storage modules, refer to section 24 ”Dismantling and Disposal”.

2.3.5 Transport Information

For information regarding the transport of the battery storage system and its battery storage modules, refer to section 10.2 "Transport”.

2.4 Handling Electrostatic Sensitive Devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- ➜ Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g. conductive foam rubber of aluminum foil.
- ➜ Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- ➜ Place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam. ESD packaging, ESD transport container).

⚠ DANGER

Danger to life as a result of unsafe operating states resulting from software manipulation

Software manipulations (e.g. viruses, trojans, malware or worms) can cause unsafe operating states in your system that may lead to death, serious injury, and property damage.

- ➜ Keep the software up to date.
- ➜ Incorporate all installed products, especially the automation and drive components into a holistic, state-of-the-art industrial security concept for the installation.
- ➜ Protect files stored on exchangeable storage media from malicious software by with suitable protection measures, e.g. virus scanners.

2.5 Warnings and Symbols on the Device

2.6 Qualification of Personnel

Installation, service and operating personnel must be sufficiently trained before installing, operating and handling the equipment.

2.7 Personal Protection Equipment (PPE)

Always wear safety equipment when working on the product.

When carrying out maintenance and service work, secure controllers, devices and units of designated area against accidental activation.

Symbol	Meaning and Application
	Gloves made of nitrile rubber against chemicals and microorganisms (at least protection index 2 according to EN 374-1) • for removal of electrolyte or hydrofluoric acid (only by FREQCON service) • Gloves according to EN 60903 - up to 1000 V AC for live working activities
	Safety shoes (toe protection, non-slip, ESD) • Operation • Cleaning Safety shoes (acid resistant) or rubber boots • for removal of electrolyte or hydrofluoric acid (only by FREQCON service)
	Tightly fitting safety goggles/basket goggles/face shield • for removal of electrolyte and hydrofluoric acid (only by FREQCON service)
	Chemical protective suit • for removal of electrolyte and hydrofluoric acid (only by FREQCON service) • for fire fighting
	Ambient air-independent breathing apparatus • for firefighting in case of smoke formation inside or outside the building (by rescue forces)

Table 6: Personal Protection Equipment (PPE)

2.8 Changes of the Product

Modifications to the product and/or mounting of parts from other manufacturers can endanger the operating safety of the product. This especially applies to tampering with safety-relevant parts.

Any modification carried out without prior written approval by the manufacturer will result in the manufacturer's declaration of conformity becoming void. The responsibility for damage and accidents caused by modifications of this kind shall be borne solely by the user.

2.9 Proper Use

The Battery Energy Storage System (BESS) described in this document is intended to feed into or draw power out of a connected electric grid by means of a power conversion system connected between both. The system specifications are listed in section 3 of this document.

The system is properly constructed, installed and commissioned by FREQCON service personnel according to manufacturer specifications. The operator ensures that the required environmental conditions are met (*see section 8 and 9*).

Modification of the device by the operator or integrator is not permitted. Only use the device in accordance with the specifications in this manual and the locally applicable standards and directives. Use contrary to the specifications and specified operating limits as well as any modification of the energy storage unit by the user is not permitted and will void the warranty!

Deviations from this manual are not permitted or require the separate written approval of FREQCON GmbH.

The system is intended for stationary use as a fixed installation. Any other or additional use is considered improper and increases the risk of personal injury and property damage when handling the energy storage system. The manufacturer rejects any liability and warranty claims for damage caused by improper use.

Access to the container is only permitted for instructed personnel. The access doors of the container must be locked if no instructed personnel are on site. The access doors of the container must be locked if no instructed personnel is on site.

Proper use also includes the following measures:

- ➜ Observe the operating manual.
- ➜ Comply with technical data.
- ➜ Comply with maintenance conditions.
- ➜ Immediately eliminate faults which hamper safety.
- ➜ Operate the unit only when it is in technically flawless condition.

2.10 Misuse

Any use which goes beyond the proper use is considered to be misuse. It can result in serious injuries or damage and is therefore prohibited.

The responsibility for damage resulting from misuse shall be borne solely by the operating company of the product.

2.11 Duties of the Operating Company

To ensure safe, smooth operation of the unit, you as the operator must comply with the following:

Personnel

- ➜ Only allow personnel with corresponding knowledge to operate and clean the product.
- ➜ Only allow a trained electrician or person with electro technical instruction to work on the electrical system. The regulations given in section 1.7 “Target Groups” must be observed.
- ➜ Clearly and bindingly specify the responsibilities for operation, service and maintenance work.

Operating Manual

- ➜ Always keep this operating manual available near the device.
- ➜ Make sure that the personnel have read and understood this operating manual before working on the device.

Safety

- ➜ Monitor the compliance with the generally valid legal and other binding safety and accident prevention regulations.
- ➜ Make sure that the users of the product wear the necessary, personal safety equipment in accordance with their job.
- ➜ Ensure that all safety and danger warnings on the product and in the installation room are kept complete and in legible condition.

Inspection and Maintenance

- ➜ Observe the adherence of the inspection and maintenance intervals in section 16 „Maintenance“.
- ➜ Operate the product only if it is flawless.

2.12 Duties of the User

The following are referred to as users:

- Persons, who install and configure the product.
- Persons, who operate the product and eliminate errors during the process.
- Persons, who carry out checking, maintenance and inspection activities.

Follow the instructions below in the interest of your own safety and for fault-free operation of the product:

➜ Read this operating manual before using the product. If you have questions, contact your superior or the safety officer.
➜ Always carry out activities based on the complete operating manual. Missing information due to an incomplete operating manual can result in serious or fatal injuries and in damage.
➜ Familiarize yourself with the safety devices of the product. Do not make any modifications to it.
➜ Do not operate the product until you have received a complete user training course for this product from an authorized person.
➜ Report any fault in the product to your superior if you cannot and may not eliminate it yourself.

3 Product Description

The battery energy storage system described in this document (BESS) is designed as a battery-to-grid system.

The BESS system is generally capable to provide the following functions, but the specific functions depend on the contractually agreed specifications:

Figure 1: BESS Functions Overview

The BESS consisting of a battery storage system with battery modules, battery control system and air conditioning systems are integrated in two (2) 40" HC containers with an active fire suppression system (*see section 4, "Design"*).

The PCS hardware and software control system as well as the converter technology incl. water cooling system with heat exchangers and air conditioning systems for the interior temperature are integrated in one (1) separate 20" container with a passive fire suppression system. The BESS is connected to the AC grid via busbars at the HV side of a 6.6 kV /620 V AC MV transformer inside the PCS container. The cable entries into the containers are located in the container floors.

It is not permitted to use the BESS system for purposes other than those specified in this manual.

Only sufficiently trained personnel are permitted to run, handle, and operate the unit (*see section 1.7* "*Target* Groups").

3.1 Working Principle

The BESS consists of a converter system with a total output of 1 MW and a battery storage system with a usable storage capacity of 5 MWh (5.5 MWh installed).

The BESS is passively charged by the energy taken from the AC grid via contactors and resistors from the DC link of the PCS as soon as the voltage level of the battery storage system falls below a value predefined in the PCS controller.

3.2 Control

A Programmable Logic Controller (PLC) is used as system controller. After commissioning and parameterization, the BESS operates automatically. The control system provides remote monitoring and access to the converter functions and set point adjustment via IT network. For detailed information regarding the control system, refer to section 6 “Control System”.

3.3 PCS

The BESS system is equipped with an integrated power conversion system (PCS), the FREQCON MSC converter system.

The key component of the converter system is a DC link converter with a control unit, generating a controlled DC voltage from the AC infeed, the so-called DC link voltage. The DC link voltage is kept to a constant level independently from the grid voltage (also in case of power feedback into the grid). It is required that the specified DC voltage setpoint is within a defined operational range.

3.4 Decoupling Protection

The decoupling protection of the converter system consists of the main controller, which evaluates the signals and controls the coupling switch (circuit breaker). In addition, peripherals for measuring the grid voltage are installed. The periphery consists of a HVIO that divides the grid voltage to a lower voltage and a PIII converter interface that digitizes the measured voltage and provides it to the main controller.

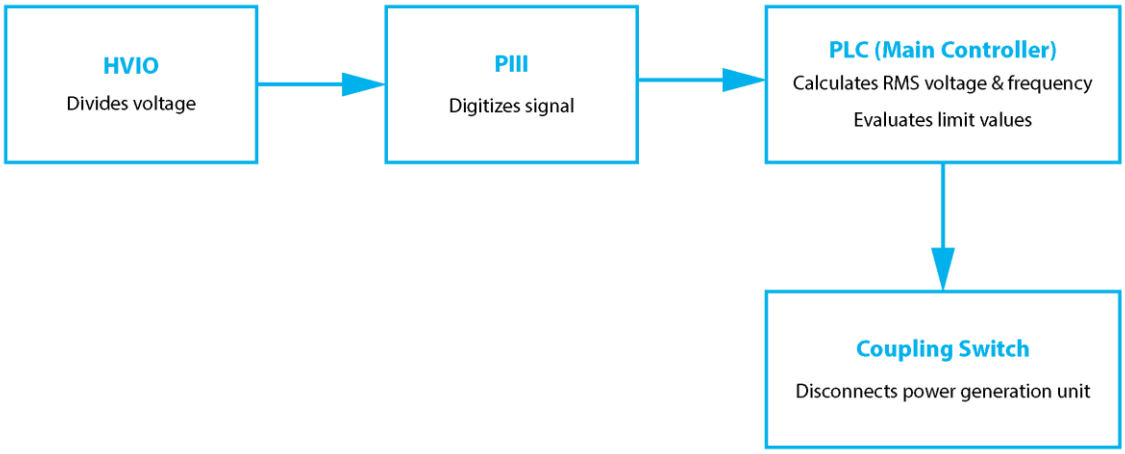


Figure 2: Decoupling protection scheme

The grid phases are measured by an HVIO board that is connected to a PIII. The voltages evaluated are phase-neutral voltages.

The measured instantaneous voltages are used to determine the RMS value, the phase angle and the frequency in the main controller. The currents are recorded directly at IGBT half bridges and also digitized via the PIII. RMS currents are calculated in the main controller.

RMS voltages, RMS currents and frequency are monitored for limit values in the main controller and the coupling switch is switched off if these are exceeded.

3.5 Auxiliary Power Supply of Protective Devices

The entire control system is buffered via a UPS. This is set so that the control and protection system is supplied with energy for at least 15 minutes.

In the event of a faulty UPS and a grid failure, the main controller fails, the grid switch opens, and the converter disconnects from the grid.

3.6 Behavior in the event of a supply voltage failure

If the supply voltage of the converter system fails, the following steps are carried out:

1. The failure of the supply voltage is immediately detected by the main controller.
2. A level 4 error is triggered. This means:
   a. All IGBTs (both DC and AC side) are switched off (500 µs after the fault occurs).
   b. The switches to the energy sources are opened (30 ms after the fault occurs), which disconnects the converter system from all AC and DC networks.
   c. The DC link of the converter system is discharged.
   d. The cooling system of the converter system is switched off (30 ms after the error occurs). This is possible because there are no more heat losses.
3. The UPS supplies the converter control system for another 15 minutes. A backup copy of the init files and parameters is created in the non-volatile memory.
   a. When the power supply is restored, this data is automatically reloaded. It is neither possible nor necessary for the customer to access the data.
   b. Important operating data of the converter system at the time of the power failure (voltages, currents, temperatures, etc.) are logged in a buffer file as long as the UPS is running. Which data is logged in detail depends on the converter type.
   c. The buffer file can be displayed via the FREQCON buffer analysis tool (subject to license) as soon as the supply voltage is available again.
4. If a battery storage system is present, the battery control is switched off immediately so that the battery storage is transferred to a safe state. No operating data of the battery system is saved.
5. Before the switch cabinet doors are opened for a visual inspection after the supply voltage has failed, it is essential to wait for the DC link to discharge.

⚠ DANGER	
	**Risk of injury due to electric shock** Discharging the DC link takes several minutes. The "Ready for Operation" signal light is not an indicator of a fully discharged DC link. Do not carry out any work on the converter before the DC link has been completely discharged. ➜ Wait until the DC link is completely discharged and check that it is de-energized as described in section 14.7 "Check Voltage-Free Status of DC Link ".

4 Design

For better handling and to increase system flexibility, all components of the BESS system are housed in containers.

BESS main components:

- BESS with installed battery modules, control systems and integrated fire protection and suppression system
- Integrated climate control system
- Integrated emergency fan system
- Several sensor systems (H2, CO; temperature and smoke)

PCS main components

- Converter system consisting of AC/DC battery converter, control system and converter cooling system
- Integrated water-air cooling system
- Integrated climate control system
- Several sensor systems (temperature and smoke)

Both the PCS and the BESS are controlled and monitored by the same main control system, which is installed in the control cabinet (CTRL) of the PCS container.

The waste heat in the interior of the containers is conducted via internal air conditioning (AC) units from the interior to external AC units at the front side of the container (*see section 4.8 "Cooling System"*).

The BESS containers are equipped with recesses on its underside for the passage of cables (*see section 11.2.2 "Cable Outlets"*). Furthermore, the PCS container is also provided with cutouts on the bottom side to connect the external AC and DC line cables to the converter system.

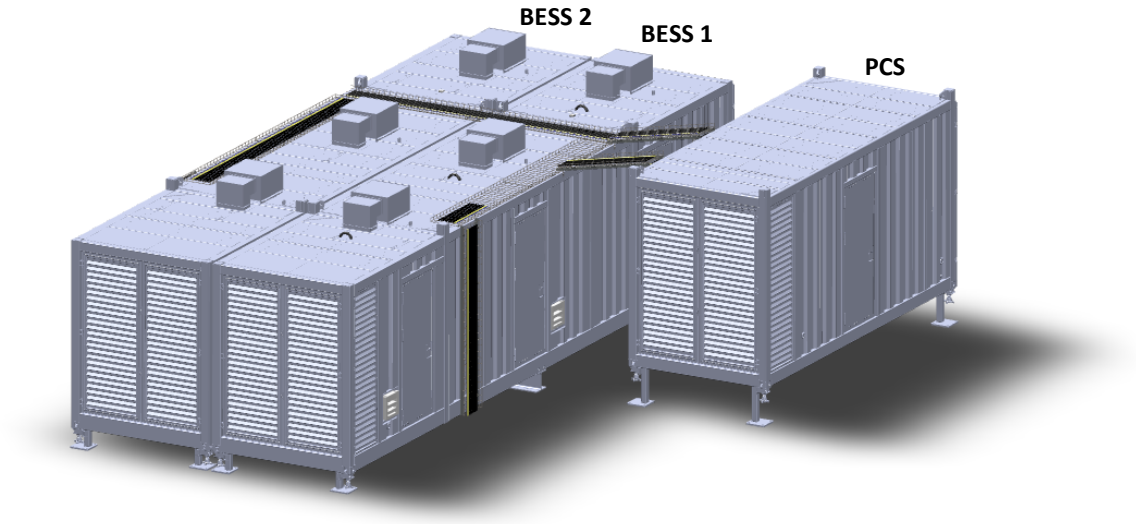

Figure 3: Design

4.1 AC Grid Connection

The BESS is equipped with AC busbars for connection of a 620 V AC grid. The AC busbars are located inside the AC_DC cabinet (*see section 4.4.3*) of the converter system.

Cutouts for inserting the AC power cables into the container are located in the container floor (*see section 11.2.2 "Cable Outlets"*). Through these cutouts, the AC power cables can be fed directly from below into the converter cabinets and connected to the corresponding AC connection busbars inside the cabinets of the converter system.

Further information and a description of the connection of the AC mains supply cables to the converter system are provided in section 11.2.4 "AC Connection".

Note:
The electrical connection must only be performed by personnel trained by FREQCON or by FREQCON service personnel.

4.2 Data Interface

The BESS system can be connected to an electronic higher-level control unit (control room) via a PROFINET interface. The required parameters (current, voltages, frequency, power) are provided by the BESS main control system and transmitted via PROFINET protocol.

The higher-level control unit is connected to the main control unit via a network isolator (114A1) in the CTRL_1 control cabinet (*see section 11.2.5 "Higher-Level Controller Connection"*).

For external control and monitoring of the converter, it is necessary that the customer has access to selected control and status variables stored in the BESS main control system, which can be read and overwritten by the customer's higher-level control. For this purpose, predefined control profiles with the relevant control variables and status profiles with all relevant status variables are stored for the data transfer between the customer's higher-level controller and the converter system.

For a detailed description of the individual data profiles, see the applicable document "23A2007_250116_Modbus_Register BESS_Vx_x_x_x".

4.3 Safety Design

4.3.1 Safety Chain Battery Cell

The battery monitoring system, BMS interface UI and BMS interface RS485, signal error messages via potential-free contacts. See also the documentation for the "BMS interface UI" and "BMS inter-face RS485" hardware modules.

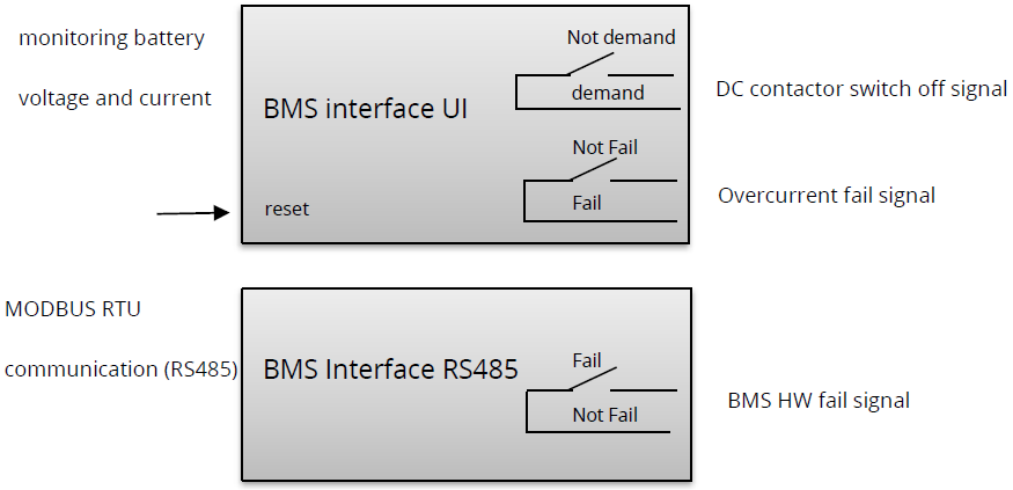

Figure 4: Safety chain battery cell

4.3.1.1 BMS Interface UI

The BMS interface UI monitors the total voltage of a battery rack and the current of the rack.
The BMS interface UI independently monitors the global battery voltage and the battery current. There is a potential-free contact for both errors which opens the contact in the event of an error.
The BMS interface UI has its own digital input for resetting an error message. If an error has been signaled and acknowledged manually via the visualization or MODBUS TCP, this digital input is set briefly.

4.3.1.2 BMS Module

The signals of the BMS interface are monitored in FB_battery_monitoring.
BMS interface RS485 HW error signal. The BMS monitors the battery cells for overvoltage, undervoltage and overtemperature.
If an error is detected locally by a BMS board, the safety chain is opened and an error is signaled.

4.3.2 Safety BMS Rack (S7)

The BMS rack monitors the following states:

- Modbus RTU communication error: The MODBUS RTU master cyclically queries the data of all BMS battery modules (MODBUS RTU slaves).
  If a MODBUS RTU slave [nmodule] is not reached or supplies faulty data, this is evaluated as a communication error. There is a communication error counter for each battery module. While a communication error increments the counter reading, successful communication re-sets the counter to 0.

- Battery voltage monitoring (cmp): The measured battery voltage is cyclically compared with the sum of the individual battery module voltages. If the absolute value of the difference be-tween the two voltages exceeds the 16 V limit value for more than 30 s, an error signal is is-sued.
- Battery monitoring cell voltage: Monitoring of all cell voltages to the maximum value of the measured voltages.
- Battery monitoring current: Monitoring of the battery current.
- Battery monitoring cell temperature: The maximum battery cell temperature is determined cyclically, approximately every 2.5 s, from all battery module cell temperatures recorded. A peak filter suppresses temperature jumps greater than 5 °C for a maximum of 8 cycles. If the average cell temperature is already close to the switch-off limit, incorrect measurements (jump) would result in a warning or error signal.
- Battery monitoring Balancer Temperature and ambient temperature Balancer
- Monitoring the battery pack connections + and - for overtemperature
- Smoke detector
- Gas sensor
- Line protection (fuses) of the auxiliary systems
- Main fuse (battery current)
- Modbus-TCP communication error: An error is triggered in the event of a communication timeout with the charging system (inverter control).
- Contactor feedback: Monitoring whether the status of the contactors matches the target status

If a fault is detected, the DC contactors open after 0.5 seconds.
In addition to errors, warnings can also be generated for cell voltages and cell currents.

4.3.3 Safety Converter Control

The converter system constantly communicates with the connected battery racks and continuously checks the following statuses:

- Modbus-TCP communication: In the event of a communication timeout with the battery racks, a corresponding rack is switched off or an error is triggered at converter level.
- Fault conditions: All faults at BMS rack level are signaled to the converter and the current is briefly set to zero to enable the DC contactors in the racks to be switched without current. Every fault reported by a rack prompts the converter system to disconnect the corresponding rack. Some error states also trigger a switch-off of the converter. The following error messages trigger a switch-off of the converter:
  - Error with the DC contactors in a rack
  - Tripping of a DC fuse in a rack
  - Triggering a smoke detector in a rack
  - Triggering a gas alarm in a rack
- Overvoltage (cell voltage): In the event of a cell overvoltage, the current setpoint value is also set to zero independently of the lookup tables.
- Undervoltage (cell voltage): If a cell is undervoltage, the batteries are charged with a low current to prevent deep discharge. If the cell voltage drops further, the corresponding rack is dis-connected.
- Warning messages: If a warning message is generated by a rack, the charging system re-quests a disconnection of the corresponding rack. As soon as the warning is no longer pre-sent, an attempt is made to reconnect the rack.

- Charge control system: To protect the cells from fault conditions, the following limits are available for charging and discharging the system. The respective limit values can be stored via lookup tables and thus set graduated limit values for the charging and discharging current. All limits are analyzed separately and the lowest limit is selected for the current limit. The limits are parameterized so that the charging or discharging current can be reduced to 0 A.
  - Maximum cell voltage
  - Maximum cell temperature
  - Maximum balance temperature
  - SOC (real)
  - Customer SOC (adjusted to capacity sold)

4.3.4 Overview of the Safety Concept

The safety aspects described in chapters 4.3.1 to 4.3.3 result in a three-stage safety concept:

1. Module level:
   - Detection of cell voltages and temperatures and opening of the safety chain in the event of a limit value violation.
2. Rack level:
   - Evaluation the safety chain and open the DC contactors if necessary.
   - In-house evaluation of cell voltages, cell currents, cell temperatures, smoke sensors, gas sensors and communication with the modules and the charging system. If required, fault generation and opening of the DC contactors.
   - Option to disconnect the rack independently if the safety chain is triggered or a self-detected fault condition occurs.
3. Converter level:
   - Evaluation of the cell voltages, currents and temperatures as well as the error states of a rack. Triggering of a converter error for selected error states of individual racks.
   - Reduction of the charging and discharging currents according to lookup tables depending on the cell voltage and temperatures.
   - Request to switch off the rack or the inverter in the event of a rack fault.

4.3.5 Fire Protection System and Suppression System

FREQCON uses highly safe lithium-ion battery cell technology: Lithium iron phosphate (LiFePO4) cells are, among other things, highly temperature resistant and significantly safer compared to cells based on other lithium-ion technologies. The use of these technologies significantly reduces the probability of a thermal runaway, as they do not catch fire even in the event of a short circuit or overcharging.

Furthermore, in addition to controlling and monitoring the state of charge at cell and system level, the FREQCON BMS (Battery Management System) also handles temperature management during charging and discharging. Every second, the temperature, state of charge and all other important operating parameters of each individual battery cell, as well as of the battery modules, are collected and analyzed by the FREQCON BMS.

This means that a potential problem of the cells is already detected at approx. 60 °C, and thus much earlier than the actual fire development the battery storage is brought back into a safe operating condition by segmental or complete shutdown.

In addition to CO sensors and smoke detectors, there are a total of 339 temperature sensors in one battery cabinet alone. This ensures that the cells are always kept within the defined and safe operating range and that, in addition to achieving high efficiency and low degradation, the probability of overloading is also excluded.

The fire protection system meets the thermal runaway propagation containment requirements of IEC 62619 as well as requirements of the EN 54 Fire detection and fire alarm systems standard.

4.3.5.1 Detection and Response

The fire protection system aims to detect malfunction as early as possible and suppress the problem before it results in a fire hazard. The system is divided into two parts. One part is primarily designed for plant protection and the other part has the aim of personal safety. For both purposes the BESS containers are equipped with several automatic detectors:

Personal safety:

- 3x H2 sensor per BESS container
- 3x emergency exhaust unit per BESS container

Plant protection:

- 1x CO sensor per battery cabinet
- 2x smoke detectors per battery cabinet
- Temperature sensors (in cells)

The carbon monoxide (CO) sensors for the battery cabinets are an extra measure to detect malfunctioning even before smoke detection (VESDA). Its primary objective is to detect outgassing from battery cells. With the cell chemistry known, the specific reactions that occur during outgassing are well understood. The relative proportions of these gases can be predicted based on the known reactions. For the used battery cells up to 169.7 liters of gas mixture of a single battery cell are released in the unlikely event of outgassing. The main components of this gas mixture being approximately:

- Carbon monoxide (CO): 11 %
- Carbon dioxide (CO2): 27 %
- Hydrogen (H2): 48 %

The CO sensors trigger an alarm based on the measured CO concentration as specified in DIN EN 50291-1:

Co concentration	No alarm within	Alarm not later than
30 ppm	120 min	-
50 ppm	60 min	90 min
100 ppm	10 min	40 min
300 ppm	-	3 min

As the complete outgassing of a single battery cell results in about 500 ppm CO in the battery room the CO sensor will be triggered in such an event based on the thresholds in table given above. The CO sensor alarm will reset when the CO concentration falls below approximately 50 ppm.

The alarm level of the analog CO sensor is set to 1000 ppm which is equivalent to a H_2 concentration of about 10 % LEL (lower explosive limit).

The smoke detector has an optical work principle and is getting triggered by (smoke) particles. It is getting also triggered from the aerosol which is released during the outgassing of a battery cell, being thereby independent of the gas concentration.

Personal safety - If an incident should occur and one sensor of the security chain for personal safety is triggered the system responds as follows:

- The complete system (BESS and PCS) is switched off and disconnected from the mains via a control system. The AC connection of the converter is disconnected, the DC connection to the battery storage system is cut off, and if existing, the MV switchgear with the transformer and low voltage distribution are disconnected from the mains.
- H2 concentration > 4000 ppm of analog H2 sensor (equivalent to about 4 % LEL H_2):
  - Battery cabinets are switched off
  - Stop charging/discharging
  - Ventilation starting (Exhaust units)
  - Error message (Error level 4)

Plant protection - Depending on which sensors are triggered the system responds as follows:

- Temperature >55 °C:
  - Battery cabinet is switched off
  - Stop charging/discharging
  - Warning message
- Temperature >56 °C:
  - Same as temperature >55 °C
  - Error message
- 1x CO sensor in the battery cabinets is triggered:
  - Battery cabinet is switched off

  - Stop charging/discharging
  - Warning message
- 2x smoke detectors are triggered:
  - Disconnects battery DC connection (contactors)
  - Deactivate converter IGBTs
  - Disconnect converter from AC connection
  - Error message
- Temperature > 300 °C:
  - StatX fire suppression triggers itself
- CO concentration > 300 ppm of analog CO sensor:
  - Battery cabinet is switched off
  - Stop charging/discharging
  - Error message

The active emergency exhaust system of the container ensures the gas concentration decreases over time. Based on the assumption of a slight overpressure of 1 Pa which is reasonable in the event of an outgassing battery cell, the estimated time for a complete air exchange in the battery room is less than an hour.

4.3.5.2 Active Fire Suppression inside Battery Cabinets

The fire protection system actively fights the fire only in the affected area (battery cabinet). This is achieved by using condensed aerosol, a compact and effective solution compared to CO2 or halocarbons. The aerosol is contained in Stat-X 60 E cartridges, which are triggered by a 12 VDC signal from the control system or self-triggered due to rupture of a temperature sensitive seal, releasing ultrafine cloud of condensed aerosol to chemically extinguish the fire. These cartridges are non-pressurized, leave minimal residue after discharge, and approved for halon and hydrofluorocarbons (HFCs). The cartridges meet the standards dictated by NFPA 2010 and UL 2775.

Each battery cabinet contains two (2) Stat-X aerosol cartridges and two (2) smoke detectors *(see figure below*). Furthermore, the battery cabinets are also equipped with temperature sensors and CO detectors. As soon as a temperature of >300°C has been reached inside the affected cabinet, the aerosol fire suppression cartridges are self-activated and the affected battery cabinet is filled with an aerosol cloud, extinguishing the fire. Aerosol is not released in other cabinets where the sensors have not been triggered, thereby eliminating the fault at the source, and preventing it from spreading to other parts of the system. The aerosol remaining in the air provides additional extended protection for a finite time against re-flash of any fire in case of lithium-ion batteries. The aerosol remains in the cabinet until it is certain that the fire hazard has been eliminated.

① Aerosol cartridge
② Smoke detector

For safety reasons, the container may not be entered for 48 hours after the extinguishing system has been triggered. The defective battery module must then be replaced by the manufacturer and the entire system is put back into operation.

The Stat-X aerosol cartridges are easily replaceable and are connected to the fire protection system again for future events.

Fire detectors will have to be cleaned and tested after a Stat-X discharge event.

After discharge there may be some minimal residue in the immediate vicinity of the generator or underneath it. This should clean up easily with water or detergent as any residue is water soluble. The Stat-X agent does not require hazmat procedures after discharge for cleanup and there are no hazardous materials in the generators themselves

4.7 Battery Modules

Figure 30: Battery module LF 280

4.7.1 Design

The lithium iron phosphate cells (LiFePO4) inside the LF 280 battery modules are connected in series and provide a total energy content of 8.96 kWh per module.

Each module is equipped with a monitoring PCB, providing the following functions:

- Voltage monitoring of single cells for charging and discharging
- Battery temperature monitoring
- Selective cell balancing
- Data exchange with central BESS controller
- Local insulation measurement
- Robust industrial design for transport, assembly und operation

4.7.2 Technical Data

Technical Data Battery Module LF 280	
Part number	508972
Rated Voltage	32 V DC
Total capacity	280 Ah
Number of cells per battery module	10
Stored Energy	8960 Wh
Maximum voltage	36 V DC
Max. current	280 A
Max. charge and discharge rate	1 C
Temperature range storage	-20 °C … +45 °C (long-term storage at 0…35°C)
Temperature range operation	0 °C … +55 °C
Connections for DC+ / DC-	Surlock Plus
Communication connections	RJ 45
Protection class	IP 20
Weight	65.3 kg
Dimensions (WxHxD)	188 mm x 239 mm x 908 mm
Cell Data (Single Cell)	
Type	Prismatic cells
Capacity (typ.)	280 Ah
Voltage (typ.)	3.2 V
Voltage (max.)	3.65 V
Voltage (min.)	2.5 V
Battery life	>3500 cycles (80% remaining capacity)
Impedance (AC)	<0.25 mΩ
BMS Pack Universal	
Power supply (external)	24 V DC (rated), <0.5 W
Power supply (internal)	36 V DC (max.), < 0.2 W
Communication	EIA-485, Modbus RTU
Baud rate (max.)	19200 Bit/s
Bus participants (max.)	32
Balancer design	Load resistor
Balancer current @3.5 V	1.06 A
Voltage measurement	10 measurements per 14-bit resolution
Temperature measurements	8x NTC 10 kΩ (up to 14 bit analogue/digital converter) 1x PT100 (12 bit analogue/digital converter)
Isolation measurement	Earth fault monitoring

Table 24: Technical data - Battery module LF280

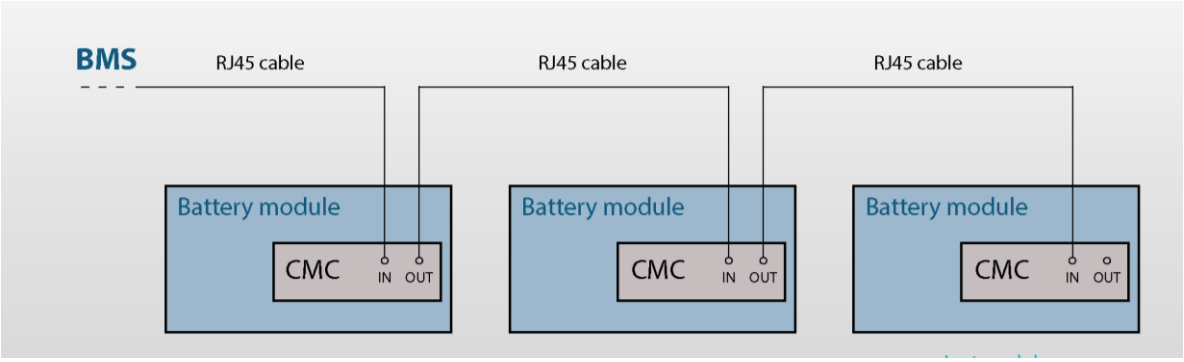
4.7.4 Communication Scheme



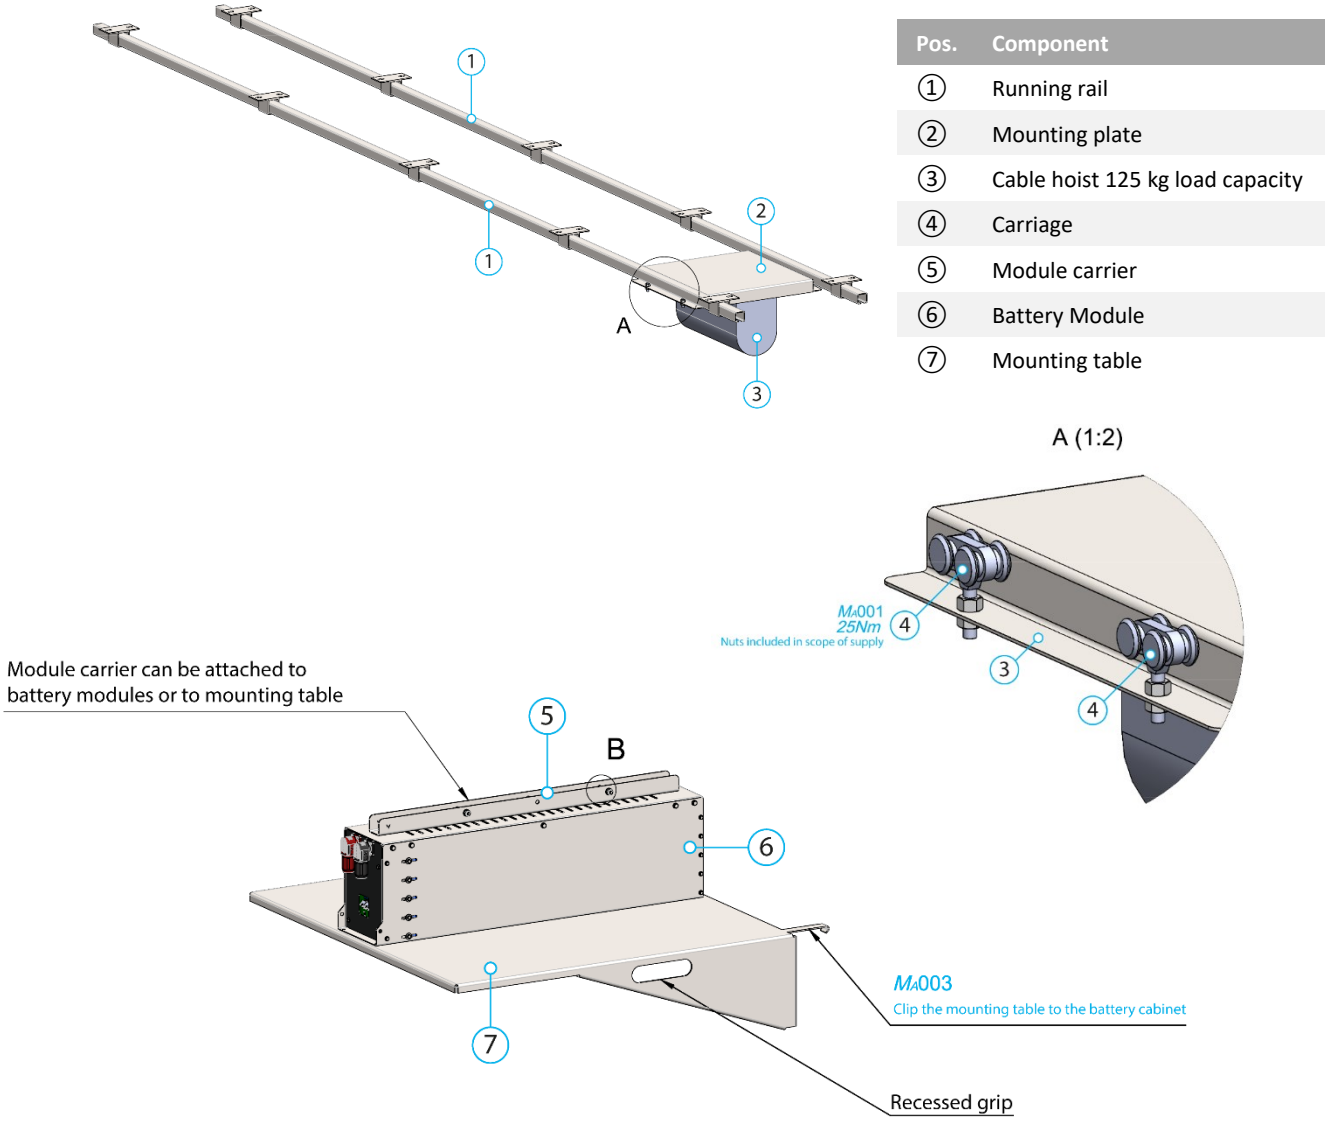


Figure 33: BMS communication scheme

4.7.5 Lifting Device and Mounting Table

For the lifting of battery modules, a lifting device is installed at the container ceiling, allowing safe handling and installation of the battery modules.

The lifting device mainly consist of a cable hoist which is mounted to a mounting plate with carriers, allowing to move the cable hoist through running rails to each end of the container. The cable hoist is operated via cable remote control.
For better handling of the battery modules when inserting them to the battery storage cabinet, a mounting table is provided, that can be attached to the battery storage cabinets.

For detailed information and operating instructions regarding the cable hoist, please refer to the original cable hoist manufacturer's original operating manual (*see section 1.2 "Applicable Documents"*).

Pos.	Component
①	Running rail
②	Mounting plate
③	Cable hoist 125 kg load capacity

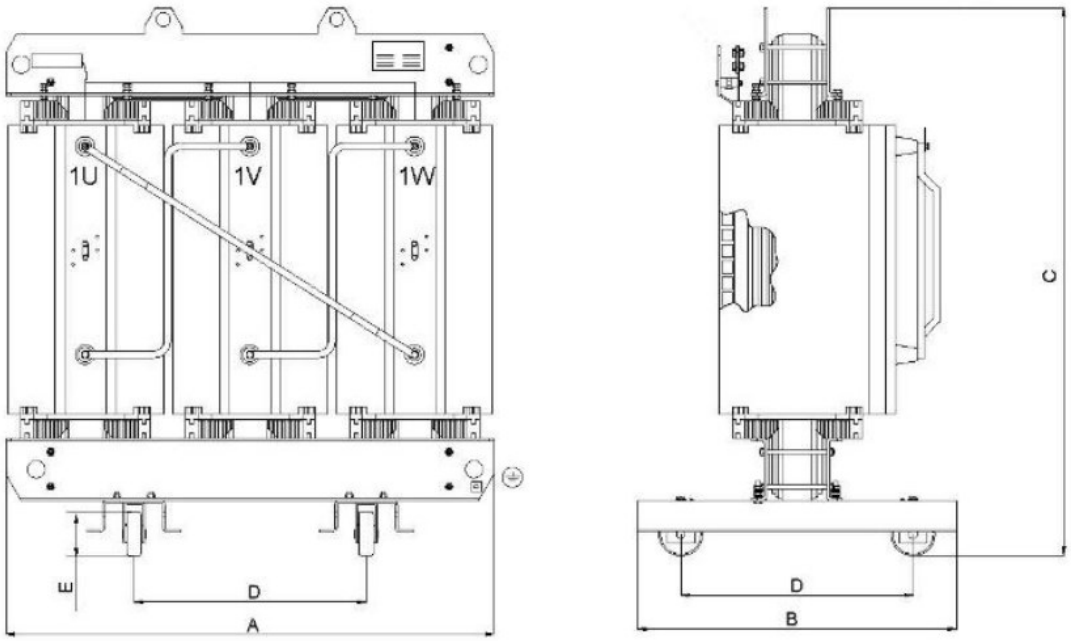
4.7.6 Mobile Lifting Device

A mobile lifting device for moving battery modules inside the BESS containers can be used. The mobile lifting device “Material-Lift GUIL ELC-725” or other models are suitable to lift and mount battery modules inside FREQCON BESS containers.

One (1) battery module can be placed onto the table of the mobile lifting device at once. The module needs to be pushed from the pallet of the forklift truck in front of the BESS container door onto the table of the mobile lifting device.



The mobile lifting device can then be moved to the battery cabinet where the battery module needs to be installed.

Figure 36: Mobile lifting device “Material-Lift GUIL ELC-725”

4.8 Cooling System

4.8.1 BESS 1 / BESS 2 Container

Pos	Component
①	Internal AC unit
②	External AC unit

Table 26: BESS 1 / BESS 2: Cooling system components

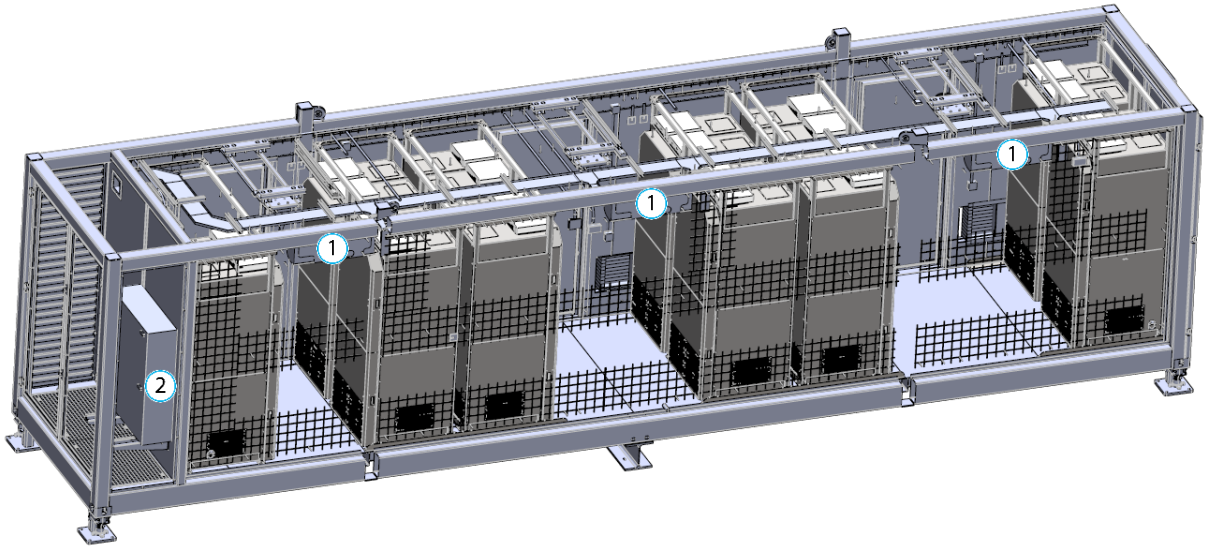

Figure 37: BESS 1 (above) / BESS 2 (below): Cooling system components

4.8.1.1 Battery Cabinets Cooling

The waste heat inside the battery cabinets is actively dissipated by two fans in the roof of each battery cabinet. The heated air is pushed out of the cabinet to the inside of the BESS container.

4.8.1.2 Container Cooling

The waste heat in the interior of the container is conducted via the three internal air conditioning (AC) units (*see Figure 37*) from the interior to the external air conditioning units of the container.

The container is equipped with several temperature sensors for monitoring the internal container temperature.

4.8.2 PCS Container

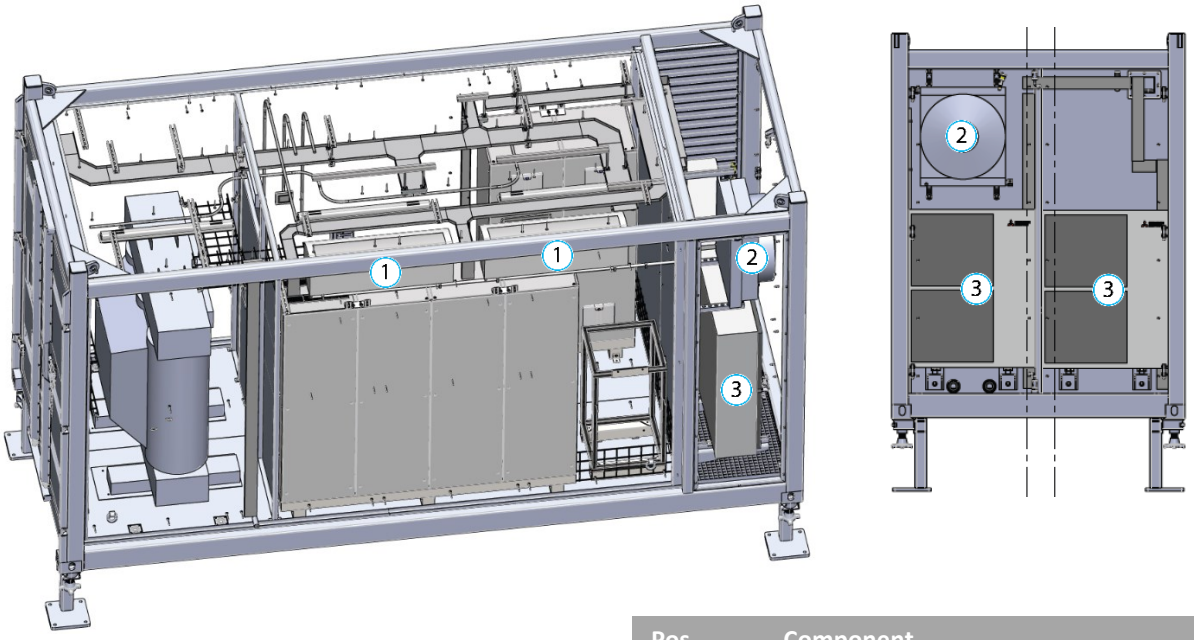

Figure 38: PCS: Cooling system components

Pos	Component
①	Internal AC unit
②	Heat exchanger
③	External AC unit

Table 27: PCS: Cooling system components

4.8.2.1 Container Cooling

The waste heat in the interior of the container is conducted via the three internal air conditioning (AC) units (*see Figure 38*) from the interior to the external air conditioning units of the container.

The container is equipped with several temperature sensors for monitoring the internal container temperature.

4.8.2.2 Converter Cooling System

To dissipate the waste heat from the IGBT power modules and inductors installed in the converter, these components are cooled down to the required operating temperature by an internal cooling system consisting of cooling hoses, coolant pumps, water distributors and four air/water heat exchangers.

The water-glycol-circulation (WGC) is designed as a closed cooling circuit. A water-glycol mix flows through the cooling modules of the converter and dissipates the heat produced by the IGBT modules. Additionally, the IGBT modules need a minimum temperature to operate properly. To heat up the IGBT modules from a cold start, the water-cooling system is pre-heated by an electrical heating element which is flange-mounted to the coolant manifold. The pre-heating process is performed to achieve an operational temperature of 25 °C, which takes about 20 minutes. After the IGBT modules have reached the temperature of about 25 °C, the converter is permitted to begin its normal operation.

The electrical pre-heater will be switched off automatically by a control unit at a temperature of > 28 °C of the coolant temperature sensor. The heating element is switched off at least 2 minutes before the pump is switched off. This procedure avoids overheating of the heating element since there must be a permanent flow around the heating element during heating.

A 3/2 directional mixing valve at the WGC unit controls the inlet temperature to the converter by mixing the water-glycol mixture of the heat exchanger and a bypass circuit. The 3/2 directional mixing valve opens at 36°C (mechanically set at mixing valve) and leads the cooling water to the heat exchanger.

Pre-heater on-off temperature hysteresis (sensor measures the inlet temperature to the converter)	
Coolant temperature > 28 °C	Heaters will be turned off
Coolant temperature < 25 °C	Heater will be turned back on

Table 28: Pre-heater on-off temperature hysteresis

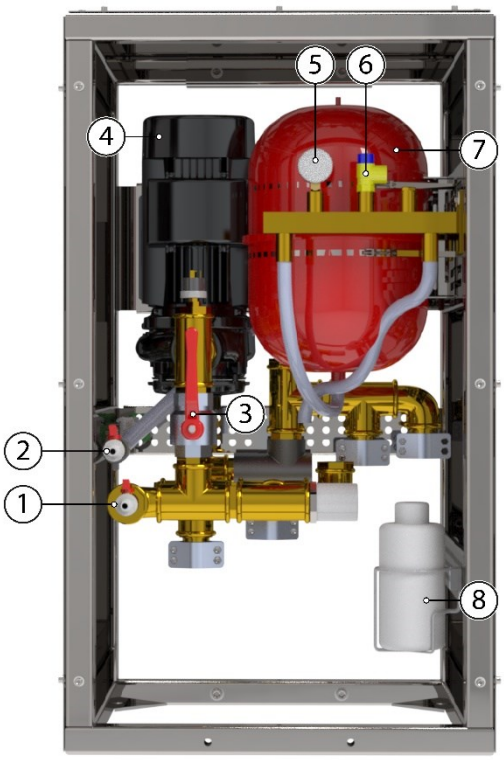

Figure 39: Cooling system cabinet (COSY) components

⑦	Expansion vessel
⑧	Overflow vessel

Table 29: Cooling system enclosure (COSY) components

4.8.2.3 IGBT modules cooling

The cooling system dissipates the heat generated during normal operation of the converter.
The IGBT modules are mounted on heat sinks through which coolant flows. Tubing connectors provide the connection to the inlet and outlet of coolant.

4.8.2.4 Coolant Specifications

Coolant		
	Manufacturer	**Description**
Allowed Coolants	NALCO AG	Varidos FSK
	BASF AG	Glysantin G30
	Clariant	Antifrogen N
	Clariant	Antifrogen L
	DOW	Dowcal 20
Coolant concentration mixed with water	> 40 % to 60 % (depending on manufacturer recommendation)	
Coolant change interval	Every 5 years	

Table 30: Coolant specifications

5 Operating Interfaces

The BESS is operated and controlled either via

- The control panel on the control cabinet CTRL of the converter (*see section 14.1)*
  - Push-buttons
    - RESET (restart emergency stop circuit)
  - Indication lights:
    - Fault (red; controller error is active)
    - Preheating (yellow; preheating of coolant)
    - Ready for Operation (green; converter is ready for operation)
    - Operating (green; converter is active)
  - Other control elements:
    - Main switch
    - Emergency-stop push button
- interface to the customer's higher-level control system (*see section 6*).

6 Control System

6.1 Main Control System

The system is controlled and monitored by a main control system installed on the P320 PLC inside the control cabinet (CTRL). Both the converter and the BESS control system are installed on the same PLC.

Data exchange between the individual cabinet control systems and BESS main control system is performed via MODBUS TCP protocol.

BESS Main Control System Overview

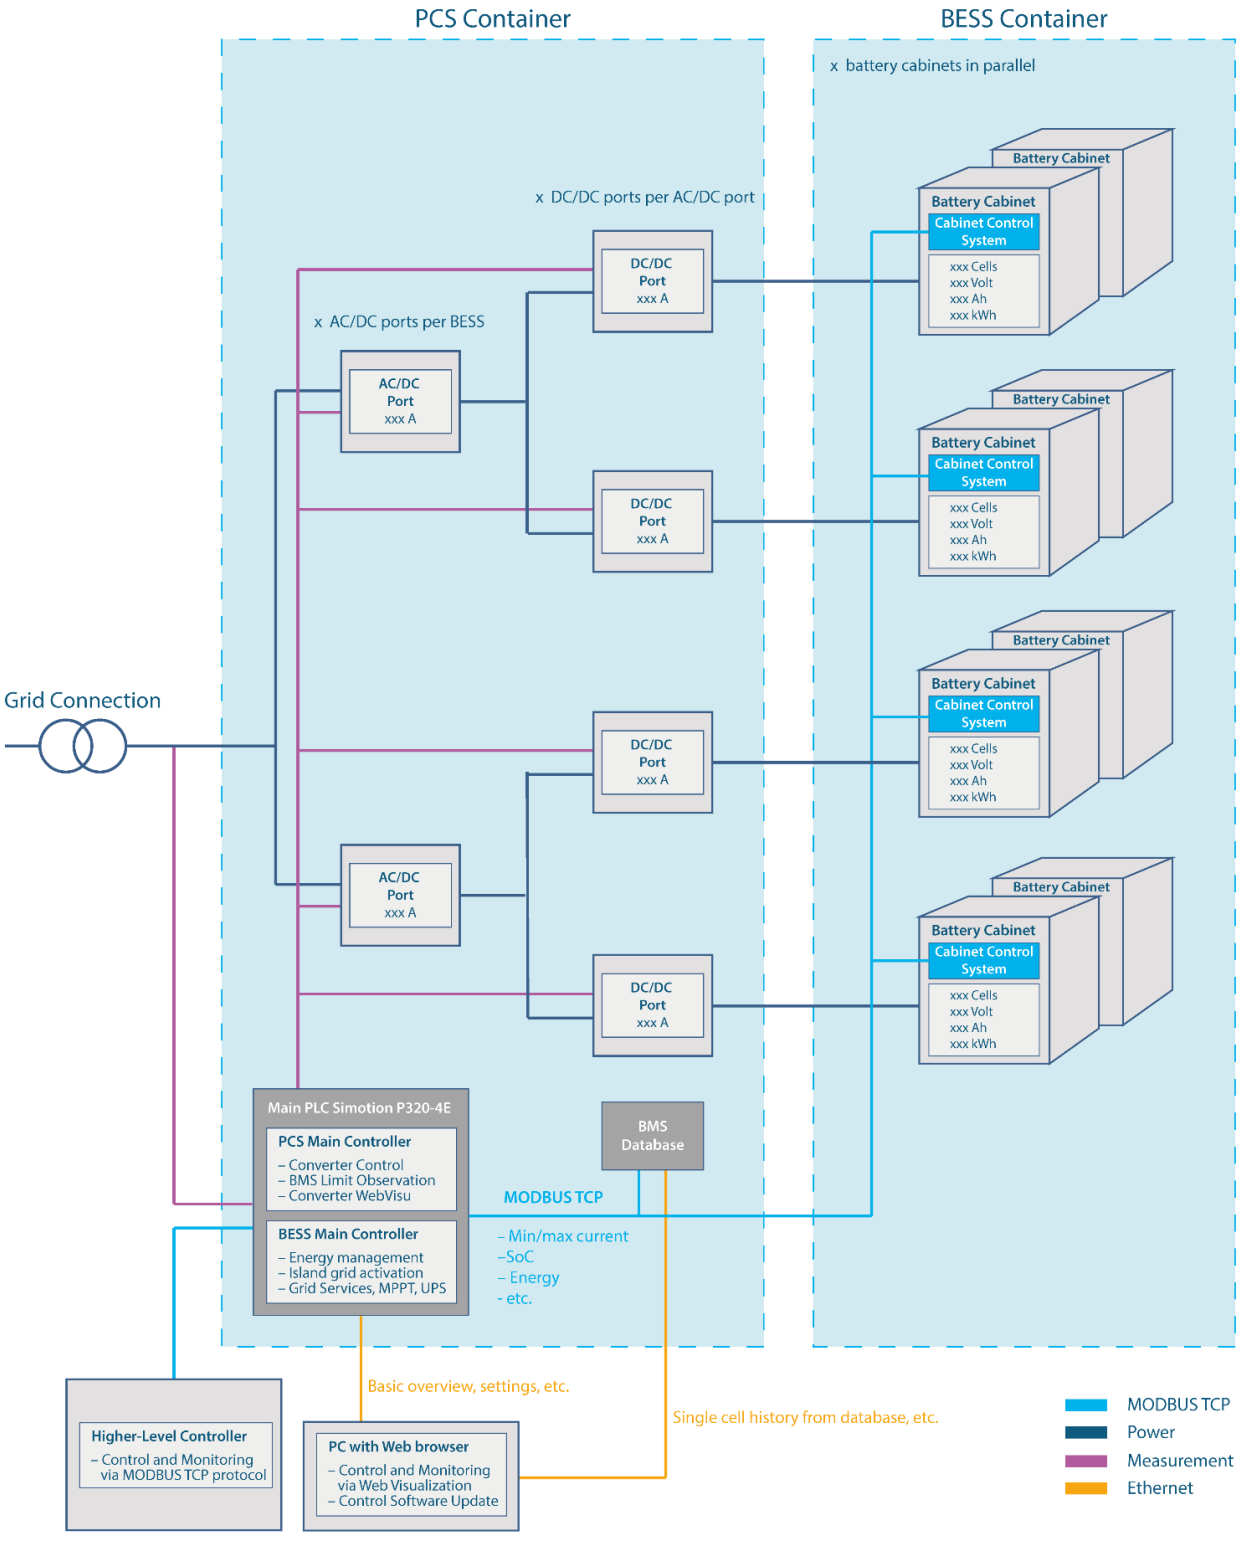

Figure 40: Main control system overview

6.2 Battery Cabinet Control System

Each battery cabinet is equipped with its own control system (Siemens S7) collecting the relevant data from the individual battery modules and providing these to the main control system (*see section 6.1*).

The tasks and features of the cabinet control system are the following:

- Monitoring of battery cell voltages and temperatures
- Monitoring of the battery charging and discharging current
- Control of DC switches
- Monitoring of line protection and smoke detectors
- MODBUS RTU Master for communication with BMS system (battery monitoring system)
- MODBUS TCP Server provides the communication interface to other systems. For example, for the external charger or the consumers

Cabinet Control System Overview

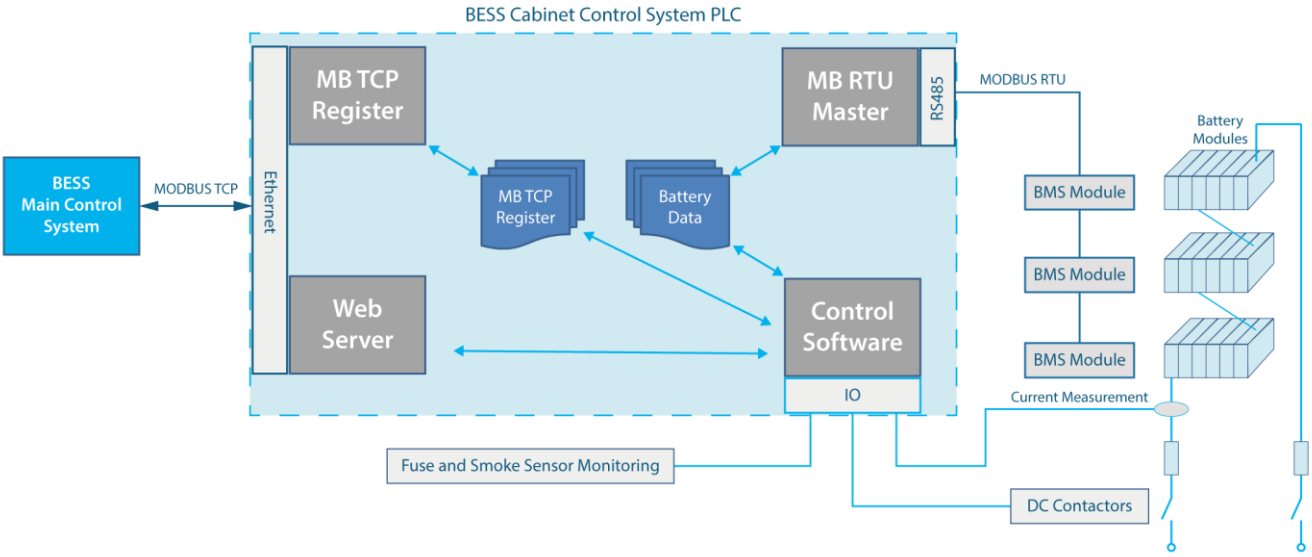

Figure 41: BESS cabinet control system overview

Data exchange between the cabinet control system and the individual battery modules is performed via MODBUS RTU protocol. Therefore, each battery cabinet is provided with several MODBUS RTU interfaces for Modbus connection of the battery modules.

6.3 Network Structure

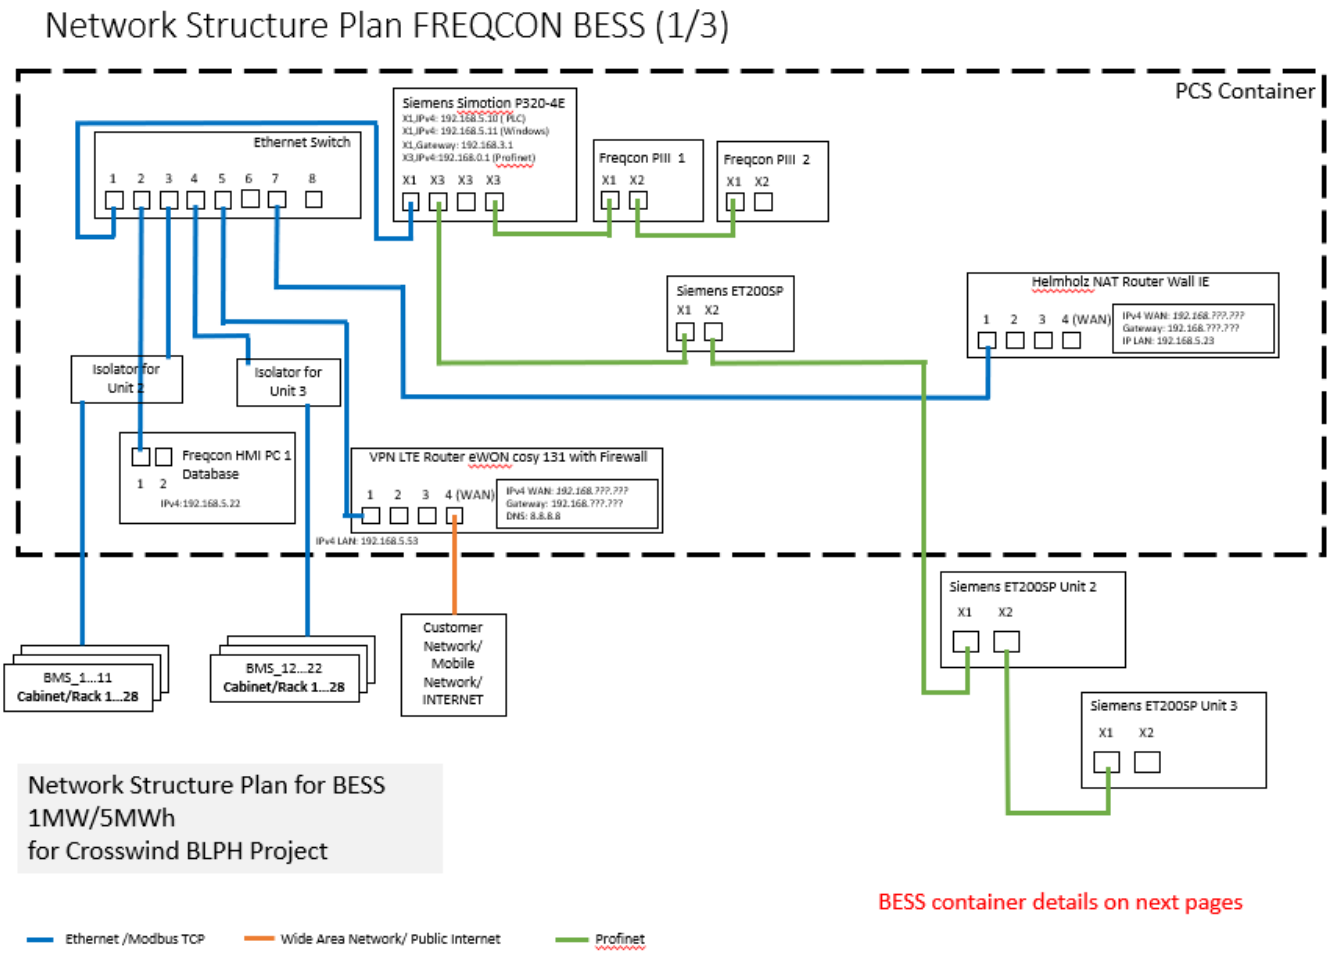

Figure 42: MSC network structure (1/3)

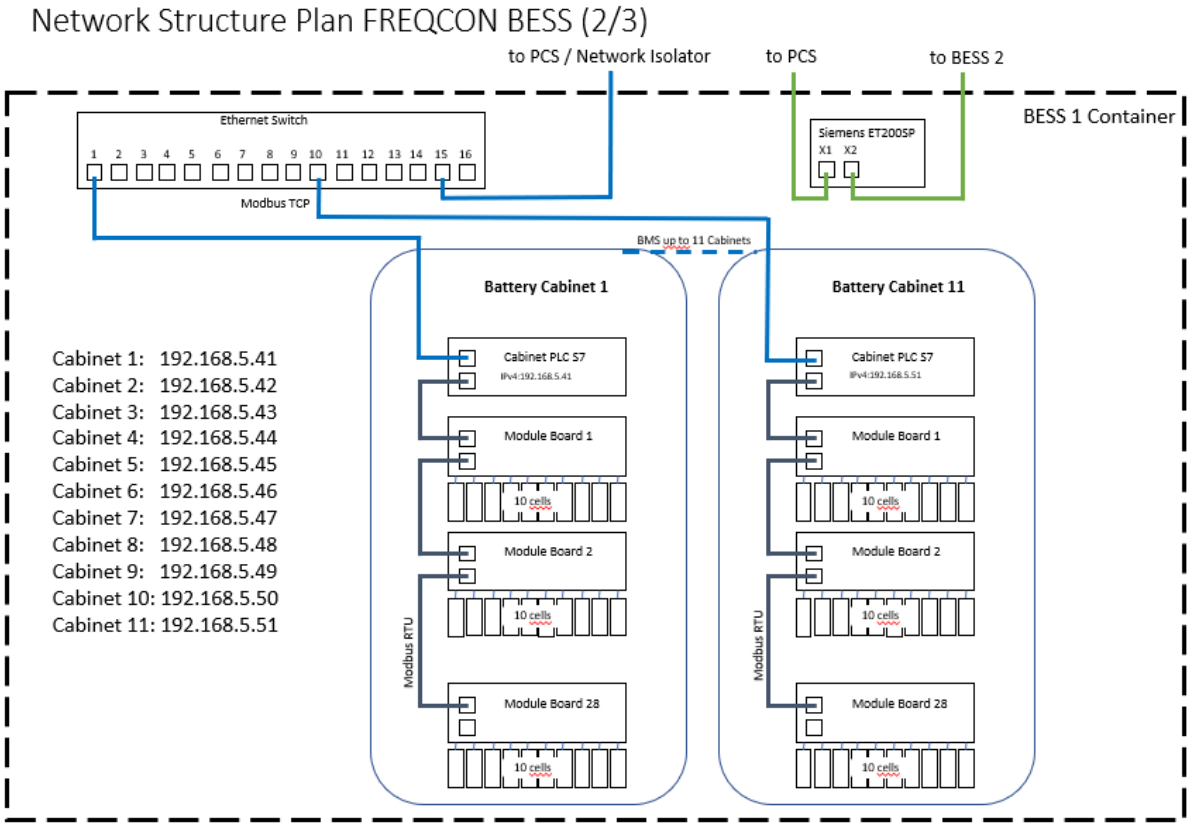

Figure 43: BESS network structure (2/3)

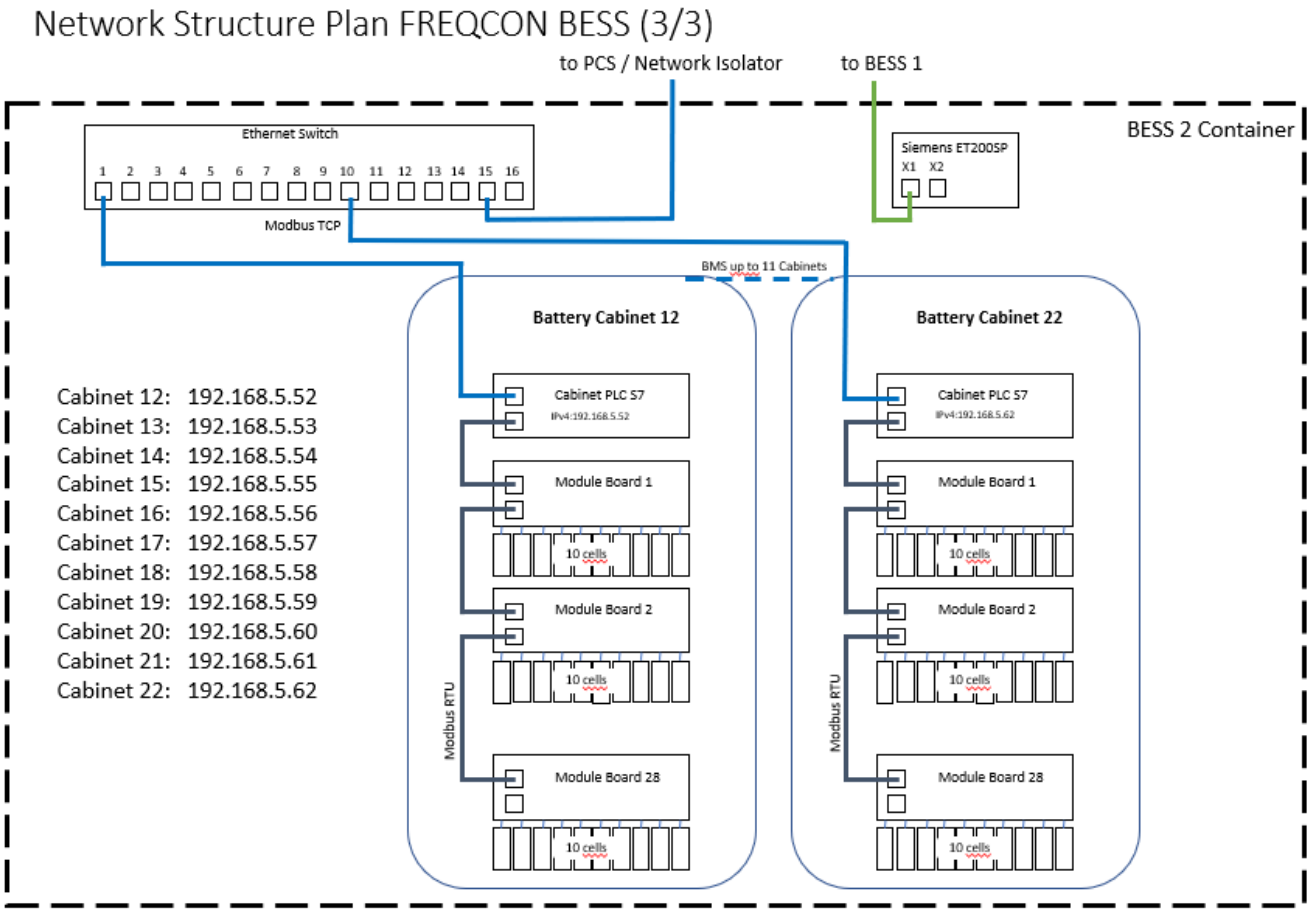

Figure 44: BESS network structure (3/3)

7 Converter Main States

The individual converter main states are depicted in the flow diagram below and described in section 7.2.

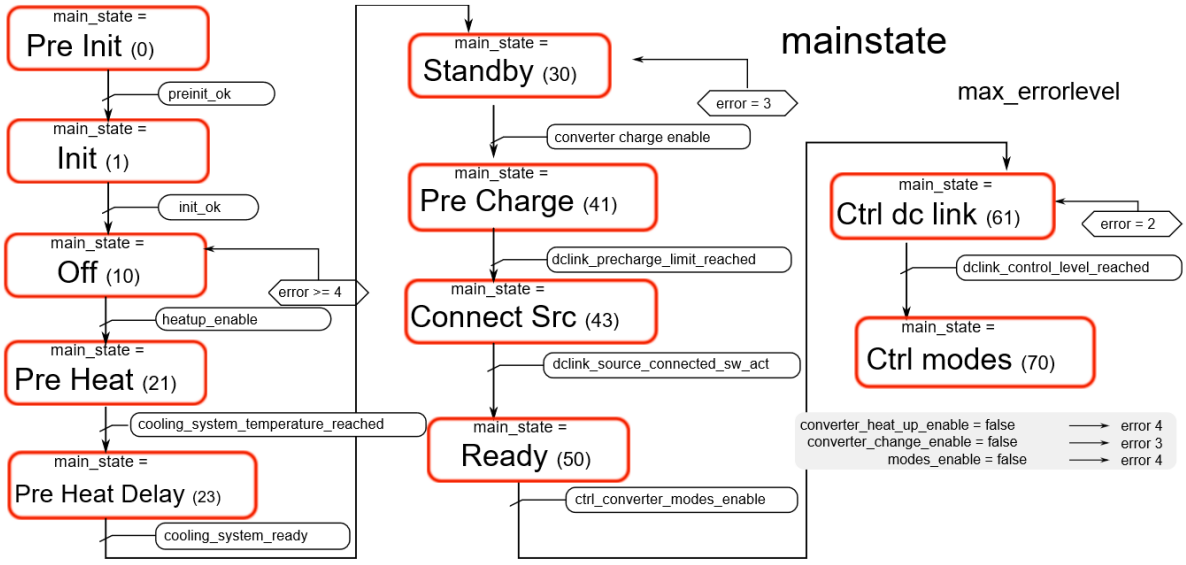

Figure 45: Converter main states

7.1 Error Levels

Error Level	Description
0	No error, logging information
1	Warning category, a warning limit is reached
2	Error category, stop subsystems
3	Error category, stop system and discharge DC-link, cooling system enable
4	Error category, stop system and also the cooling system

Table 31: Error levels

7.2 Main States

INIT

The system was turned on and the stored initialization parameters are read. Cooling and converter system are stopped.

OFF

DC link is discharged. The converter and cooling system are not in operation.

Pre-Heat

The converter is switched-off and is preparing for operation. The cooling system regulates to the optimum temperature of the cooling water, IGBT, capacitors and inductors.

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

Heat-Delay

The converter is preparing for operation. The operation temperatures of the components are reached and maintained for a defined time span.

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

STANDBY

Standby mode – converter is off, but the cooling system is in operation.

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

Pre-Charge

The converter´s main DC-link is pre-charged to a defined voltage level.

An error level 3, such as detection of wrong grid conditions, is leading to a change to main state STANDBY (converter is off, cooling system is in operation).

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

Connect SW

Source contactor is closed.

An error level 3, such as switching error of the source contactor, is leading to a change to main state "STANDBY" (converter is off, cooling system is in operation).

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

READY

Converter is ready for operation. Cooling system is operating, the DC link is charged and source is connected.

An error level 3, such as grid faults, is leading to a change to main state STANDBY (converter is off, cooling system is in operation).

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

DC link Ctrl

The converter power module that is set to "DC link control" mode is activated.

An error level 2, such as derating, DC link errors or over temperature, are leading to a change to main state READY (converter is off, cooling system is in operation).

An error level 3, such as grid faults, is leading to a change to main state STANDBY (converter is off, cooling system is in operation).

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

Ctrl Mode

The remaining converter power modules that are enabled are activated. The converter is operating.

An error level 1, such as power module over temperature, over-current or over-voltage, is leading to a stop of the respective power module.

An error level 2, such as derating, DC link errors or over temperature, are leading to a change to main state READY (converter is off, cooling system is in operation).

An error level 3, such as grid faults, is leading to a change to main state STANDBY (converter is off, cooling system is in operation).

An error level 4, such as a cooling system leak, leads to a change to main state "OFF" (stop cooling system and converter).

10 Transport, Storage and Commissioning

Please observe the instructions for transport in section 10.2 and for storage and professional handling in section 10.3.

10.1 Unpacking

⚠ CAUTION

Hazard by sharp edges on packaging
Improper handling during unpacking can cause injuries.
➜ Use appropriate safety gloves to protect your hands from possible cuts.

The packaging of the system consists of cardboard, plastic and corrugated board. After usage the packaging must be disposed according to the local regulations for the disposal of paper products (e.g. recycling). After delivery, the delivered units and components must be checked for completeness and damage. If any damage on the delivered units and components have been found, contact the delivery service or FREQCON GmbH immediately.

10.2 Transport

Regarding the transport of the battery modules, refer to the battery module manual.

⚠ DANGER	
	**Hazard by electrolyte release due to mechanical damage to battery modules** Severe burns, long-term physical damage, and environmental damage due to electrolyte. ➜ The device must be disconnected before maintenance work. Work under voltage is not permitted. ➜ Observe the safety data sheet of the battery module and keep it accessible at all times. ➜ Never open battery modules by force. ➜ Avoid contact with escaping electrolyte at all costs, leave the danger area immediately. ➜ In case of ingestion, immediately alert the emergency services! ➜ In case of eye contact: Rinse cautiously with water for several minutes. Remove any contact lenses and continue rinsing. Call poison information center or doctor! ➜ In case of skin contact: Remove contaminated clothing immediately. Wash/shower skin with plenty of water. Call poison control center or doctor! ➜ Prevent release of electrolyte into the environment at all costs. ➜ Wear suitable protective equipment when disposing of electrolyte *(see section* 2.7 "Personal Protection Equipment (PPE)").

⚠ DANGER	
	**Fire due to short circuits in the event of mechanical damage to the battery modules.** Severe burns or death due to short circuits that may result in fire. The electrolyte used is highly flammable as a liquid or vapor. ➜ Avoid mechanical damage. ➜ Never open battery modules by force. ➜ Protect the system against vandalism. ➜ Fire loads or sources of fire near the installation site are not permitted. ➜ In the event of damage, press the emergency OFF button immediately. ➜ In case of fire, leave the danger area immediately and alert the fire department!

NOTICE
Inadequate transportation of the device and all of its components may cause damage to the installed components. ➜ Vibrations and jolts must be avoided during transportation. ➜ The container must be transported in a horizontal position (lying down). ➜ Make sure to observe the specific national safety precautions for transport by truck, train or ship´.

NOTICE
Do not transport the containers with installed batteries ➜ Lifting or Moving of the Container is not allowed if battery modules are inside the container ➜ Remove every battery module from the container before lifting or mowing the container

The container must be transported to the installation site by instructed personnel.

The container weight is specified in section 8, "Technical Data" on page 93. Make sure that the components can be placed at ground level.

For information regarding the dimensions and center of gravity of the container, see section 10.2.2. The container weight is specified in section 8, "Technical Data". Make sure that the components can be placed at ground level.
Vibrations and jolts must be avoided during transportation. If the system was damaged during transport, you must immediately inform the responsible transport company.

The cabinet must be transported in a horizontal position (lying down). It is not permitted to tip over the container during transportation or in any other scenario.
Applied assemblies (if existing) must be protected against damage by external influences during transportation and storage.

All persons involved in the transport of lithium batteries must be trained and certified according to regulations.

The information provided below is for informational purposes only.

10.2.1 Container Lifting

⚠ DANGER	
	**Heavy load** **Improper lifting can result in death, serious injury or property damage.** Never lift the container above people. Use only lifting and personal protective equipment approved by OSHA or other national institutions.

NOTICE
Only use an appropriate crane to lift the container, capable to withstand the loads specified as follows: Total weight of cabinet combination *see section 8, „Technical Data“ page 93.*

NOTICE
Observe the container´s center of gravity during lifting: Observe the container´s center of gravity during lifting with crane, shown in section 10.2.2.

To lift the containers with a crane, use the four transport lugs on the top corners of the container (*see following illustration*).

PCS

NOTE:
Empty container, no batteries installed

Figure 52: BESS 2 Container – dimensions and center of gravity

10.3 Storage

10.3.1 Storage Condition

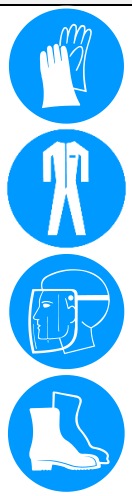
NOTICE	
	Damage to components in the event of improper storage. The storage conditions of the energy storage device are only maintained when the climate control of the container is active. ➜ Keep air conditioning activated/enabled even in case of storage. ➜ Supply energy storage with power even if it is out of operation. ➜ Only deactivate air conditioning if storage conditions are maintained by other measures. ➜ Condensing must be avoided.

NOTICE
The cooling liquid inside the cooling system must be removed at least once every five years. ➜ Check the pressure on the expansion tank every time the cooling liquid is exchanged. The cooling system must be completely drained during a pressure test of the expansion vessel *(see section 17.8.1.3 "Draining the cooling* system*")*.

NOTICE
➜ The BESS container must not be exposed to strong vibrations. ➜ Condensing must be avoided.

NOTICE
The battery of the UPS unit of the converter system must be removed from the battery module at storage temperatures of <0°C. ➜ The removal of the UPS battery is described at 17.3.2.

Store the components of the energy storage system under the following conditions:



➜ Store the components of the energy storage device according to pollution degree 2 (no conductive pollution).
➜ Do not expose components of the energy storage device to aggressive media.

Storage Condition	Value
Storage temperature	*see technical data in section 8*
Max. relative humidity	*see technical data in section 8*
Positioning of the product during storage	laying down, horizontal

Table 34: Storage conditions

10.4 Assembly and Initial Commissioning

⚠ DANGER	
	**Electric shock due to low voltage and arcing on loose wires.** Severe irreparable damage to the nervous system, burns and death. ➜ Access to control cabinets and string cabinets only by FREQCON service personnel or by FREQCON instructed and authorized maintenance personnel. ➜ Plant control units may also be opened by instructed persons with the qualification of a qualified electrician. ➜ Work on electrical and electronic components as well as cables of the battery system may only be carried out by FREQCON service personnel!

⚠ DANGER	
	**Electric shock due to low voltage and arcing on loose wires.** Severe irreparable damage to the nervous system, burns and death. ➜ Access to control cabinets and string cabinets only by FREQCON service personnel or by FREQCON instructed and authorized maintenance personnel. ➜ Work on electrical and electronic components as well as cables of the battery system may only be carried out by FREQCON service personnel! ➜ Wear personal protection equipment (Electrician's gloves, protective visor, safety shoes, hearing protection)

The energy storage system may only be installed and commissioned by trained service personnel or by FREQCON instructed and authorized maintenance personnel.

11 Mounting

11.1 General

The BESS container must be set up and positioned safely at the installation site and may only be installed by instructed FREQCON service personnel.

Service personnel must at least have the following tools in reach before starting the installation:

Pos.	Installation Tools	Amount
	Basic Tools	
1.	Flashlight	1
2.	Pliers set	1
3.	Ratchet set	1
4.	Torque wrench (1 - 100 Nm)	1
5.	Socket wrench set (with sockets 7 – 19 mm)	1
6.	Wrench set	1
7.	Cross-section screw drivers set	1
8.	Flat-section screw drivers set	1
9.	Allen key / Hex socket key set	1
10.	Cutter	1
11.	First-aid kit	1
12.	Multi-meter instrument	1
13.	Two-pole voltage tester	

Table 35: Installation tools

⚠ DANGER	
	**Electric shock due to low voltage and arcing on loose wires.** Severe irreparable damage to the nervous system, burns and death. ➜ Access to control cabinets and string cabinets only by FREQCON service personnel or by FREQCON instructed and authorized maintenance personnel. ➜ Plant control units may also be opened by instructed persons with the qualification of a qualified electrician. ➜ Work on electrical and electronic components as well as cables of the battery system may only be carried out by FREQCON service personnel or by FREQCON instructed and authorized maintenance personnel.

⚠ DANGER
Make sure that the energy source is locked and tagged and ensure that the isolation is effective before conducting work on the system. After switching-off the voltage supply, some components might still carry a charge. Check all poles using a suitable device.

⚠ WARNING
The electrical connection must be carried out in accordance with the local regulations of the utility company and /or VDE (in Germany).

Do not operate!	Lock and tag power switches and controller devices
	Observe national laws regarding Occupational Safety and Health, as well as Industrial Standards. ➢ DIN VDE 0105-100; VDE 0105-100:2009-10 Operation of electrical installations - General requirements.

11.1.1 Cable Routing

It is recommended that the power cables and the control cables are installed in separate trays. Avoid long parallel runs of power cables with other cables in order to decrease electromagnetic interference.
Where control cables must cross power cables, make sure they are arranged at an angle as near to 90 degrees as possible.
The cable trays must have good electrical connection to each other and to the grounding/earthing.

11.1.2 Coding

11.1.2.1 Coding Terminal Strip

Terminal designation	Description
-XE1	Main power supply 600 V AC
-XE2	DC power supply 1000 V DC
-XE	Main power supply 400 V AC
-X1	Main power 400 V / 230 VAC
-X2	Light cabinet 230 V AC
-X3	Control voltage 24 V DC
-14X1	Control voltage 24 V DC (to DC contactors)
-X5	Low-voltage signals
-XDC0	24 V DC power supply
-XDC1-4	Control voltage 24 VDC (UPS)
-XT	Transfer terminal block 24 V DC / 230 V AC

11.1.2.2 Coding Wiring colors

Cable	Color
L1/L2/L3	Black
N	Light blue
PE	Yellow-green
External voltage	Orange
Control voltage 24 VDC	Dark blue
Analog signals	White

11.1.2.3 Coding Power Supply

Terminal	Phase
U1	L1
V1	L2
W1	L3

11.2 Installation location

⚠ DANGER

Danger to life due to electric shock!
The DC paths and the connection cables are not protected against overload by the BESS.
Select external components according to the specified nominal and maximum currents of the BESS.
➜ If necessary, use appropriate protective equipment for the external components.

⚠ DANGER

Danger from and for unauthorized persons
Unauthorized persons are not aware of the dangers in the work area and may endanger themselves and third parties danger.
➜ Keep unauthorized persons away from the work area.
➜ If in doubt, speak to persons and direct them away from the work area.
➜ Interrupt the work as long as unauthorized persons are in the work area.
➜ Always keep the entrance door(s) locked when not performing work on the system to prevent unauthorized persons from entering the container.

⚠ WARNING

Danger to life due to unsuitable lifting material
While lifting the battery modules use only suitable lifting equipment and lifting tackle
➜ Make sure that all the material and equipment is designed for the weight and all required inspections have been done.
➜ Make sure that no person is under the battery module during lifting.

⚠ CAUTION

Danger to life due to unsuitable lifting material
While lifting the container and/or battery modules use only suitable lifting equipment and lifting tackle
➜ Make sure that all the material and equipment is designed for the weight and all required inspections have been done.
➜ Make sure that no person is under the container or battery module during lifting.

NOTICE

Equipment damage due to intruding animals
Prevent animals from entering the interior of the container from below through the cable glands or recesses.
➜ Secure the container from the outside with suitable protection against the entry of animals.

The BESS containers are designed for outdoor installation, on a flat and ground level surface. Make sure that the environmental conditions meet the values of section 8 „Technical Data“ and section 9 “Environmental Conditions”.

The entrances to the containers must be accessible from every side to allow for visual inspections or maintenance and repair work, if necessary

Air inlets and outlets of the containers, as well as on the cabinets inside the container, must always be kept free and cleaned of dirt in order to ensure the required air flow of the installed fans.

A2:17	Solarflex-X 1x 70	DC Cable - DC-4_1 BAT	9.5 [0.374“]	RM 20W40 3.5-16.5 [0.138“-0.650“]

11.2.4 AC Connection

⚠ DANGER

Before performing work on the BESS, make sure the system is disconnected from all power supplies, the feed-in disconnectors are open and secured against unintentional reclosing.

NOTICE

- ➜ Comply with the minimum cable cross-sections indicated in the wiring diagram provided.
- ➜ Always secure AC power cables with adequate strain relief in order to prevent the removal of the power cables from the AC connections after installation.

To connect the 620 V AC network, the system provides AC, PE and N connection busbars within the **AC_DC cabinet** *(see circuit diagram and following figure, ① to ⑤)*.

Also refer to the provided circuit diagram (*see section 1.2 "Applicable Documents"*) when connecting the BESS to the AC grid.

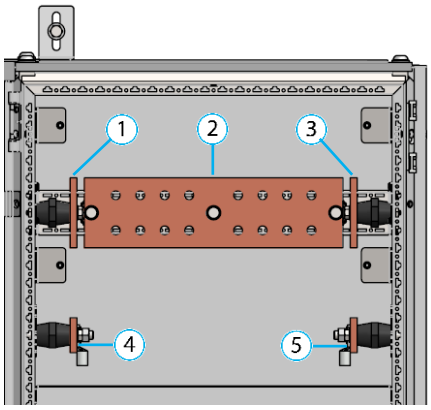

Figure 58: AC grid connection busbars inside AC_DC cabinet

Pos.	Description	Identifier
①	AC grid connection busbar L1	78W1
②	AC grid connection busbar L2	78W2
③	AC grid connection busbar L3	78W3
④	AC grid connection busbar N	78W5
⑤	AC grid connection busbar PE	78W4

Table 36: AC grid connection busbars inside AC_DC cabinet

Task 1: **Connect the AC grid supply cables to the designated AC grid connection busbars inside the AC_DC cabinet *(see wiring diagram and illustration below)*.**

Step 1 : Lead the customer-side AC grid supply cables through the recess provided in the container floor from below into the container interior.

Step 2 : Lead AC grid supply cables through the recess provided in the cabinet floor of the AC_DC cabinet from below to the inside of the cabinet.

Step 3 : Locate the 78W1, 78W2 and 78W3 AC connection and the PE and N busbars inside the AC_DC cabinet (*see illustration above,* ① - ⑤).

Step 4 : Screw the three grid phase cables L1, L2, L3 and the PE and N cable to the corresponding connection busbars inside the AC_DC cabinet (*see illustration and table above,* ① - ⑤) using appropriate cable lugs, screws, nuts and washers.

Step 5 : Apply the torque specified by the screw connection manufacturer to the connection.

Step 6 : Check connections for tightness.

✓ **The AC grid supply cables were successfully connected to the corresponding AC grid connection busbars in the AC_DC cabinet.**

11.2.5 Higher-Level Controller Connection

⚠ DANGER

Before performing work on the BESS, make sure the system is disconnected from all power supplies, the feed-in disconnectors are open and secured against unintentional reclosing.

The converter system is mainly controlled and monitored via the customers´ higher-level controller. The higher-level controller is connected to the BESS main controller via a PROFINET interface. Therefore, a network isolator (114A1) is provided inside the control cabinet 1 (CTRL_1) of the converter system, to which the higher-level controller can be connected via an Ethernet line.

To connect the higher-level controller to the converter controller via Ethernet line, proceed as follows:

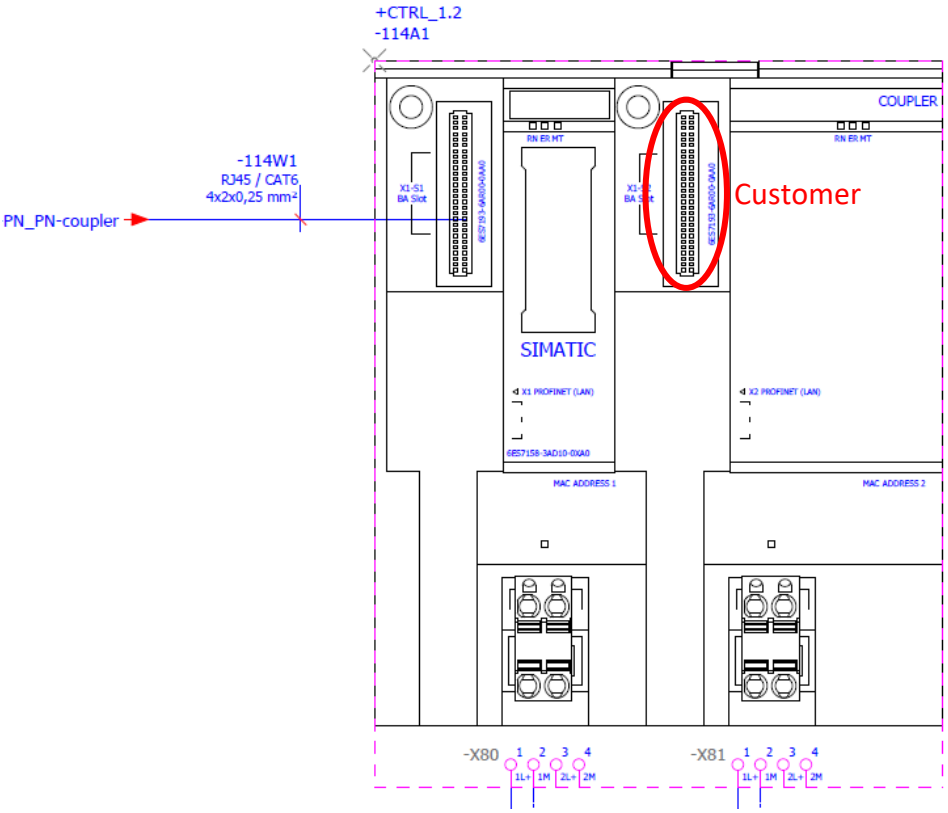

Figure 59: Network isolator 114A1 inside CTRL_1 cabinet

Task 1: **Connect the customer-side higher-level controller to the BESS main controller cabinet (*see circuit diagram and illustration above*).**

Step 1 : Lead the Ethernet cable coming from the external, higher-level controller through the recess in the bottom of the control cabinet 1 (CTRL_1) into the cabinet interior.

Step 2 : Locate the network isolator (114A1) inside the control cabinet.

Step 3 : Connect the external Ethernet cable to the free port of the network isolator.

✓ **The higher-level controller has been successfully connected to the BESS main controller via Ethernet cable.**

12 Pre-Commissioning

Follow the steps below for preparations prior to commissioning of the converter:

Do not operate!	Lock and tag power switches and controller devices
⚠ DANGER 	Disconnect power and block operation controller devices. Follow national laws regarding Occupational Safety and Health. 1. Identify the energy source(s). 2. Isolate the energy source(s). 3. Determine voltage-free status. 4. Ground device or equipment to protect from short circuiting and from shocks. 5. Lock and Tag the energy source(s). 6. Prove that the equipment isolation is effective. 7. When required, apply lock-out device or clamp and secure with padlock(s).

12.1 Activate Motor Contactors and Fuses

Task 1: Activate motor contactors and test auxiliary voltages

Set the main switch on the control cabinet door to ON position. ☐

Activate the motor contactors inside the converters system cabinets. ☐

Check the 400 V AC power supply using the corresponding terminals inside CTRL cabinet. ☐

Task 2: Switch on fuses

Switch on all 24/230/400V AC/DC fuses inside the cabinets. ☐

Install the fuses for the UPS supply. ☐

Check, whether the 24 V DC voltage has the correct polarity and magnitude. ☐

Switch on all the 24 V DC fuses (130F1) if not already activated (green indicator lights indicate activated fuse). ☐

After this action all the control devices indicator lights in the control cabinet including the main PLC Siemens SIMOTION P320 should glow green, indicating that these parts are activated and working.

12.2 Check Power Cables

Inspect wiring for proper installation and connection. See wiring diagram for detailed information about the wiring. ☐

12.3 Check Communication Cables

Inspect wiring for proper installation and connection. See wiring diagram for detailed information about the wiring. ☐

Communication between main PLC and converter is established. ☐

12.4 Cooling System Preparations

The cooling system is set under 3 bar air pressure for at least 1 hour. The system pressure must not decrease within that time. ☐

The system is filled with coolant under working pressure of 3 bar and checked for leakage for at least an hour. ☐

13 Commissioning

Follow the steps below for commissioning of the BESS:

Task 1: **Converter Commissioning**

Step 1 : Make sure that the customer-side mains is switched off and decoupled from the converter system.

Step 2 : Make sure that all the work and action instructions listed in section 11 "Mounting" have been carried out.

Step 3 : Follow all instructions listed in section 14.4.

✓ **The BESS is now ready for operation.**

14 Operation

⚠ DANGER	
	Do not enter the container if the warning light is on (red light) ➜ It is only allowed to enter the container if the warning light indicated that it is safe to enter the container (green light) ➜ If the warning light is completely off (no green or red light) consider that it is not safe to enter the container. Before entering the container, make sure that there is no fire inside and no harmful atmosphere

NOTICE	
	• Staying in the container during operation is not permitted, except to turn-off the system in case of emergency • Use the remote interface to start the converter • Do always switch off the converter if you go inside the container

14.1 Operating Panel

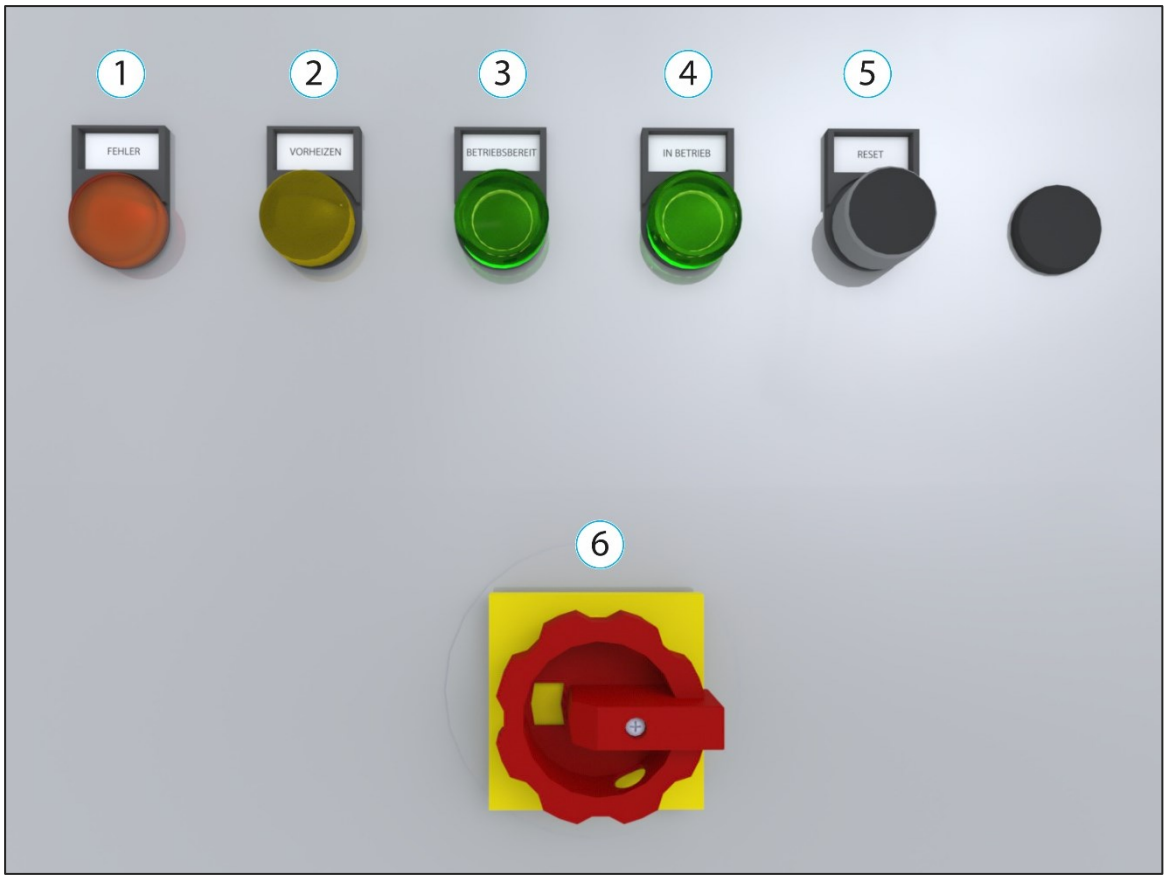

Figure 60: Operating panel

14.2 Indicator Lights

Pos.	Indicator Light	Description
①	**Fault**	**Flashing light** A warning of the converter main controller is present. The converter remains in operation. Constantly glowing: A fault has been detected by the converter main controller. The BESS does not function correctly.
②	**Preheating**	**Flashing light** The cooling liquid is preheated until the set cooling liquid temperature has been reached. Constantly glowing: The coolant temperature has reached the set temperature and is maintained for a set time span (defined in controller). **Light off:** The cooling liquid temperature was maintained for the time span defined in the controller. The preheating process is finished.
③	**Ready for Operation**	**Flashing light** The DC-link of the converter is pre-charging until the set voltage has been reached. **Constantly glowing:**

		The DC-link is precharged to the set voltage and the power switches are closed.
④	**Operating**	**Constantly glowing:** The converter´s IGBTs are enabled. The converter is operating.

Table 37: Indicator lights

14.3 Control Elements

Pos.	Control Element	Description
⑤	**Reset** *Push button*	Resets an existing fault of the main controller and the emergency stop relay.
⑥	**Main switch** *Rotary Switch*	Main switch 480 V power supply for converter control electronics.

Table 38: Control Elements

14.4 Switching on the BESS

Carry out the following steps to switch on the BESS:

Task 1: **Switch on the BESS**
Step 1 : Make sure that the external emergency stop button (customer side, if present) is not activated.
Step 2 : Switch the main switch (*see figure 60,* ⑥) to the "ON" position.

Note 1: If the temperature inside the control cabinet falls below 15°C, the internal control cabinet heating is automatically switched on. The main control is only enabled after the temperature limit value of >5°C has been reached.
Note 2: Once the BESS control system has started up, the function commands transmitted by the higher-level control system are executed.
Note 3: If the BESS control unit detects an error, the red "Fault" indicator (①) lights up.

Step 3 : Check the BESS control system for error messages via the higher-level control system (customer side using WebVisu or communication interface).
Step 4 : Resolve the error(s) if possible.
Step 5 : After successful troubleshooting, acknowledge the error by sending a "Reset" command via the higher-level control system (customer side via WebVisu or communication interface) or the reset button on the CTRL cabinet (⑤*)*.

	For detailed information on the control commands, such as the reset command, which are transmitted to the BESS control system via the customer's higher-level control system, please refer to the document "Description of data profiles" (*see section 1.2 "Applicable Documents"*).

	The control bits described below can be set simultaneously and are automatically processed by the control system in the correct sequence.

Step 6 : Set the **converter_heatup_enable** bit to **TRUE** via the communication interface of the external control room or via the WebVisu. The signal initiates the preheating process of the cooling system. This process normally takes 20 minutes. The "Preheating" indication light illuminates (*see figure 60,* ②).
Step 7 : As soon as all temperatures are within the permissible range, the "Preheating" indication light goes off.
Step 8 : Set the **converter_charge_enable** bit to **TRUE** via the communication interface of the external control room or via the WebVisu. The signal initiates precharging of the DC link and the "Ready for operation" indication light (③) starts to flash. As soon as the DC link is pre-charged, the main switch responsible for the DC link control is switched on and the "Ready for operation" indication light (③) starts to light up constantly.
Step 9 : Set the **converter_modes_enable** bit to **TRUE** via the communication interface of the external control room or via the WebVisu. The signal activates the pulse enable of the grid IGBT´s.
Step 10 : If no errors have occurred, the BESS starts normal operation and the "Operation" indication light (④) lights up constantly.

Step 11 : The detailed procedure for switching on the converter system must be carried out in accordance with the document "Description of data profiles" (*see section 1.2 "Applicable Documents")*. The sequence of the individual steps is shown on the "Flow Chart" tab.

✓ **The BESS is now switched on and in operation.**

14.5 Switching off the BESS

Follow the steps below in order to switch-off the converter:

⚠ DANGER	
	**Electric shock hazard!** **Do not perform maintenance work on a live system.** After switching off the converter, the DC-link of the converter still carries dangerous voltages, which may cause death or severe injuries if touched or short circuit. ➜ Before performing work on the converter, deenergize the converter, wait for 30 minutes until the installed capacitors are discharged and check the voltage-free status of the DC-link by using a 2-pole voltage tester. ➜ It is not allowed to open the cabinet doors before the converter system has been de-energized and the capacitors are discharged. ➜ It is not allowed to perform any work on the converter before the system has been de-energized.

⚠ DANGER	
	**Electric shock hazard!** **Do not perform maintenance work on the converter system, before the converter system has been disconnected from all power sources.** After switching off the converter, the connected DC power cables of the battery strings, the DC connection busbars in the AC_DC cabinet and the DC switch & fuse units continue to carry dangerous voltages that can cause death or serious injury if touched or short-circuited. ➜ Before starting work inside the converter cabinets, de-energize the converter system as described in section 14.6 “De-Energizing”, wait for 30 minutes until the installed capacitors are discharged and check the voltage-free status of the DC-link by using a 2-pole voltage tester. ➜ Disconnect the DC power cables from the converter system using suitable DC disconnecting devices before carrying out any work in the cabinets of the converter system. ➜ Before disconnecting the DC power cables from the DC connection busbars, always check for voltage-free status of the DC power cables, since dangerous electric arcs may lead to severe injuries or death when disconnecting the power cables.

⚠ DANGER	
	**Electric shock hazard!** **Do not perform any work on the MV switchgear and the MV transformer before the PLC container has been disconnected from all voltage sources.** After switching off the converter, the connected MV transformer, the MV switchgear, its connecting cables and terminals continue to carry dangerous voltages which, if touched or short-circuited, can cause death or serious injury. ➜ Before working on the medium voltage components of the converter container, de-energize the converter system as described in section 14.6 “De-Energizing”. ➜ Disconnect the AC mains connection by opening the MV switchgear. ➜ Before disconnecting the AC power cables from the AC connection busbars, always check the voltage-free status of the AC power cables, otherwise dangerous arcs can cause serious injury or death when disconnecting the power cables.

⚠ DANGER	
	**Electric shock hazard!** **Do not perform any maintenance work on the converter system before the AC circuit breaker and MV switchgear have been switched off and protected against unintentional reclosure.** ➜ Before starting work inside the converter cabinets, the AC circuit breaker 80Q1 must be switched off and protected against unintentional reclosure as described in section 14.8.3 “Protect the CB Against Unintentional Reclosing”. ➜ Before you start working inside the control cabinets, the medium-voltage switchgear must be switched off and protected against unintentional reclosure.

Task 1: **Switch off the BESS.**

Step 1 : To switch off the converter, carry out the steps in reverse order according to the document "Description of the data profiles" in the "Flow chart" tab (*see section 1.2 “Applicable Documents”*).

Step 2 : Set the **converter_modes_enable** bit to **FALSE** via the communication interface of the external control room or via the WebVisu. The signal deactivates the pulse enable of the grid IGBT´s.

Step 3 : Set the **converter_charge_enable** bit to **FALSE** via the communication interface of the external control room or via the WebVisu. The signal opens the main switch and initiates the discharge of the DC link. As soon as the main switch is open, the "Ready for operation" indication light goes off (*see figure 60,* ③).

⚠ DANGER	
	**Risk of injury due to electric shock!** **Discharging the DC link takes several minutes. The "Ready for operation" indication light is not an indicator of a fully discharged DC link. Do not carry out any work on BESS before the DC link has been completely discharged.** ➜ Wait until the DC link is completely discharged and check that it is de-energized as described in section 14.7 "Check Voltage-Free Status of DC Link ".

Step 4 : Set the **converter_heatup_enable** bit to **FALSE** via the communication interface of the external control room or via the WebVisu. The signal switches off the water cooling of the converter after a run-on time of 2 minutes.

Step 5 : Switch the main switch on the converter control cabinet (*see figure 60,* ⑥) to the "OFF" position.

✓ **The BESS is now switched off.**

The UPS can be switched off by pulling the blade type fuse of the UPS unit.

14.6 De-Energizing

Carry out the following steps to de-energize the BESS system:

⚠ DANGER	
	**Electric shock hazard!** **Do not perform maintenance work on a live system.** After switching off the converter, the DC-link of the converter still carries dangerous voltages, which may cause death or severe injuries if touched or short circuit. ➜ Before performing work on the converter, deenergize the converter, wait for 30 minutes until the installed capacitors are discharged and check the voltage-free status of the DC-link by using a 2-pole voltage tester. ➜ It is not allowed to open the cabinet doors before the converter system has been de-energized and the capacitors are discharged. ➜ It is not allowed to perform any work on the converter before the system has been de-energized.

⚠ DANGER	
	**Electric shock hazard!** **Do not perform maintenance work on the converter system, before the converter system has been disconnected from all power sources.** After switching off the converter, the connected DC power cables of the battery strings, the DC connection busbars in the AC_DC cabinet and the DC switch & fuse units continue to carry dangerous voltages that can cause death or serious injury if touched or short-circuited. ➜ Before starting work inside the converter cabinets, de-energize the converter system as described in section 14.6 “De-Energizing”, wait for 30 minutes until the installed capacitors are discharged and check the voltage-free status of the DC-link by using a 2-pole voltage tester. ➜ Disconnect the DC power cables from the converter system using suitable DC disconnecting devices before carrying out any work in the cabinets of the converter system. ➜ Before disconnecting the DC power cables from the DC connection busbars, always check for voltage-free status of the DC power cables, since dangerous electric arcs may lead to severe injuries or death when disconnecting the power cables.

⚠ DANGER	
	**Electric shock hazard!** **Do not perform any work on the MV switchgear and the MV transformer before the PLC container has been disconnected from all voltage sources.** After switching off the converter, the connected MV transformer, the MV switchgear, its connecting cables and terminals continue to carry dangerous voltages which, if touched or short-circuited, can cause death or serious injury. ➜ Before working on the medium voltage components of the converter container, de-energize the converter system as described in section 14.6 “De-Energizing”. ➜ Disconnect the AC mains connection by opening the MV switchgear. ➜ Before disconnecting the AC power cables from the AC connection busbars, always check the voltage-free status of the AC power cables, otherwise dangerous arcs can cause serious injury or death when disconnecting the power cables.

⚠ DANGER	
	**Electric shock hazard!** **Do not perform any maintenance work on the converter system before the AC circuit breaker and MV switchgear have been switched off and protected against unintentional reclosure.** ➜ Before starting work inside the converter cabinets, the AC circuit breaker 80Q1 must be switched off and protected against unintentional reclosure as described in section 14.8.3 "Protect the CB Against Unintentional Reclosing". ➜ Before you start working inside the control cabinets, the medium-voltage switchgear must be switched off and protected against unintentional reclosure.

Task 1: **De-energize the BESS**

Step 1 : Switch-off the converter system like explained in section 14.4.

Step 2 : Secure the AC circuit breaker(s) from unintentional reclosure, like explained in section 14.9.3.

Step 3 : Decouple the customer AC connection from the converter system using a suitable disconnection device.

Step 4 : Wait for 30 minutes until the converters´ DC link is discharged and check the voltage-free status of the DC-link by using a suitable 2-pole voltage tester.

✓ **The BESS is now switched off and de-energized.**

14.7 Check Voltage-Free Status of DC Link

The DC link voltage can be up to 1300 VDC. Make sure that the measuring device for testing the absence of voltage in the DC link is suitable for this voltage range.

For converter systems with more than one DC link, the following steps must be carried out to check the absence of DC link voltage on each DC link.

The following steps must be followed to check that the DC link is de-energized:

Step 1 : After switching off the system, check the DC link voltage on the WebVisu or via the communication interface of the external control room.

Step 2 : Check that the DC link is de-energized at the HVIO measuring fuse 173F2 between connections 2 and 4 in the CTRL cabinet.

Step 3 : In addition, check that the DC link is de-energized at the HVIO measuring fuse 173F2 by measuring between connection 2 and N (or PE) in the CTRL cabinet.

Step 4 : In addition, check that the DC link is de-energized at the HVIO measuring fuse 173F2 by measuring between connection 4 and N (or PE) in the CTRL cabinet.

Step 5 : Check that there is no voltage on the DC link between a DC- connection (*see figure below*, ①) and DC+ connection (②) of the PowerStack.

➜ For switch cabinets with more than one installed PowerStack, access to the DC link connections is at the bottom stack.
➜ The DC+ connections are positioned slightly to the rear compared to the DC connections.

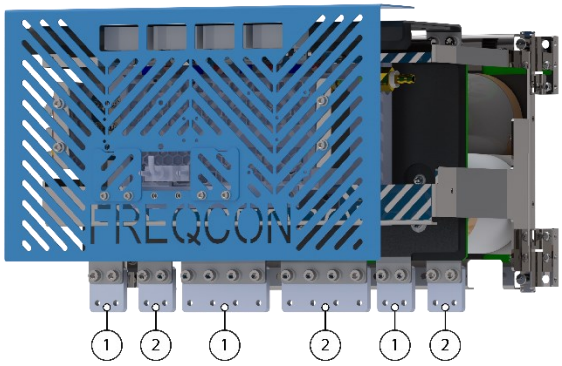

Figure 61: DC- connections ① and DC+ connections ② on the PowerStack (figure may differ from the actual design)

14.8 AC Circuit Breaker

NOTICE

The AC main circuit breaker(s) must not be switched manually!
Do not switch the AC main circuit breaker manually under any circumstances, as this could damage the breaker and the equipment.

The converter system is equipped with an individual 3WL circuit breaker, in order to disconnect the connected grid from the BESS systems electric circuit.

The main circuit-breaker(s) is/are located in the CIR cabinet (*see section 4.4.3 "Internal Components"*).

To protect the circuit breaker against unauthorized switching and to protect the maintenance and operator personnel, the circuit breakers contain a number of locking devices.

For instructions on how to secure the circuit-breaker(s) against reclosing, see section 14.8.3.

Detailed information can be found in the manufacturer's documentation for the circuit-breaker (*see also section 1.2 "Applicable documents"*):

Document type	Document Name	File Name
Operating instructions AC circuit breaker	3ZX1812-0WL00-0AN4	3ZX1812-0WL00-0AN4_online_201806140915326928

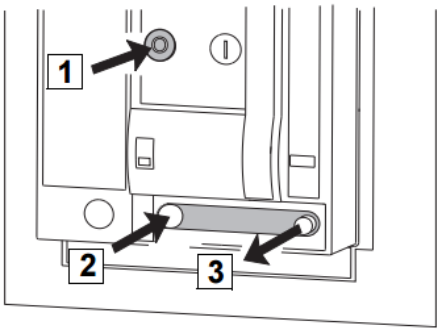
(4) Shutter

Figure 63: Circuit breaker positions

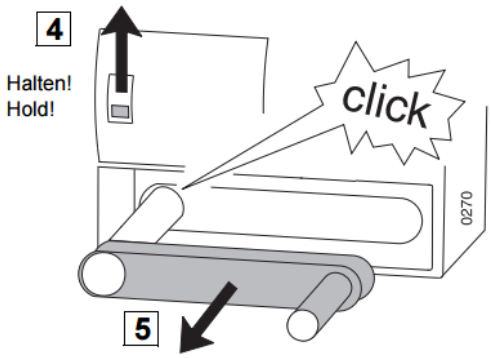


14.8.3 Protect the CB Against Unintentional Reclosing

Drawing out of the racking handle can be prevented by fitting a maximum of three padlocks. The circuit breaker is then locked against moving.

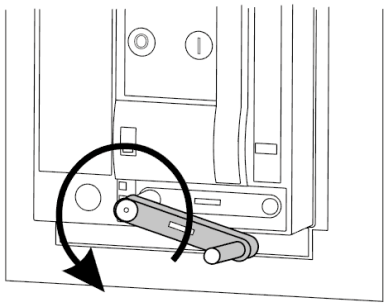
Task 1: **Unlocking the racking handle/ Withdrawing racking handle.**

Step 1 : OPEN circuit breaker.



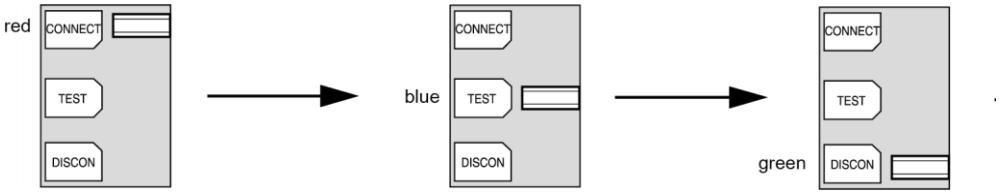
Step 2 : Push the crank.

Step 3 : Pull out handle.



Step 4 : Lift and hold the control lever.

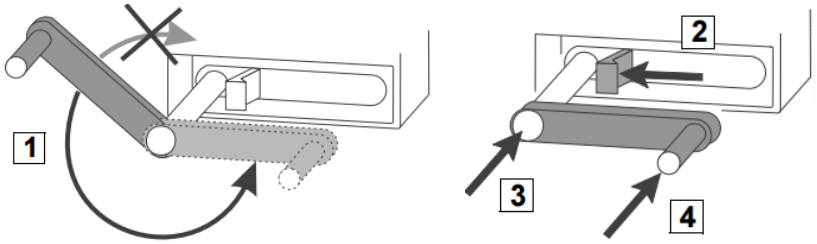
Step 5 : Pull out the crank.



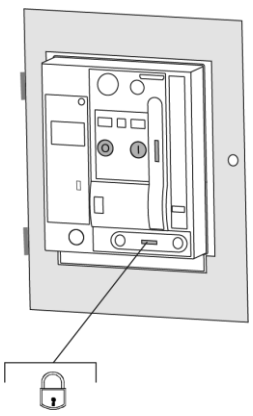
Task 2: Racking circuit breaker into the disconnected position.

Step 1 : Rack the handle until the disconnected position is indicated by the position indicator (green).

Position indicatior



Task 3: Push in the racking handle.



Step 1 : Bring the racking handle to the position indicated in the illustration below.

Step 2 : Push in the crank.

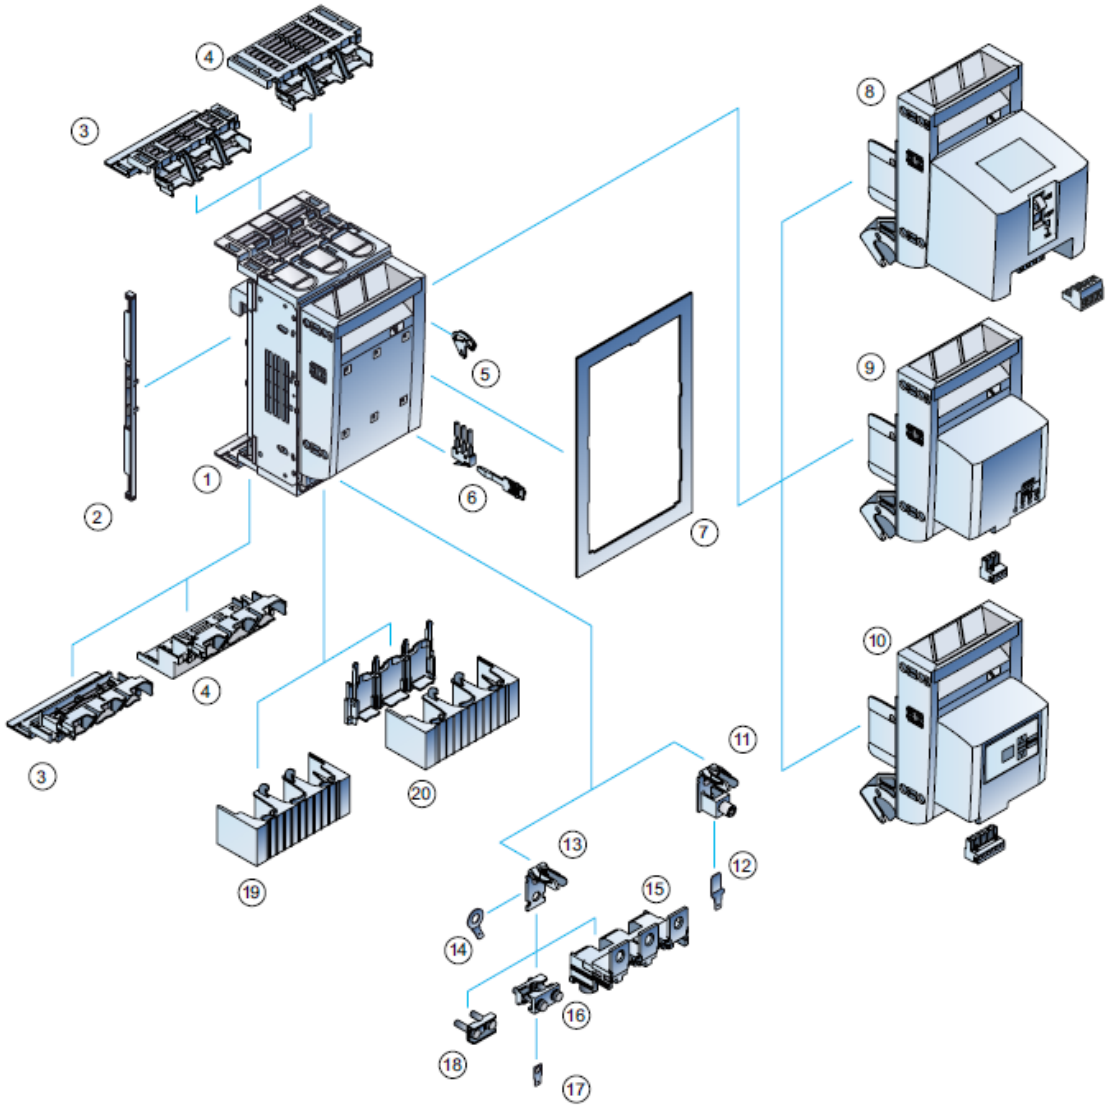
Step 3 : Push in the handle.

Task 4: Lock the racking handle with one or more padlocks.

14.9 DC Fuse Switch Disconnectors

NOTICE	
	**The DC fuse switch disconnectors must not be switched manually!** Do not switch the DC fuse switch disconnectors manually under any circumstances, as this could damage the breaker and the equipment.

Each of the battery storage cabinets is equipped with a DC fuse switch disconnector, in order to disconnect the corresponding battery cabinet from the electric circuit of the BESS.



A DC fuse switch-disconnector is located on the mounting plate at the bottom of each battery cabinet.

To protect the DC fuse switch disconnector against unauthorized switching and to protect the maintenance personnel, the disconnector is provided with locking devices.

For instructions on how to prevent unintentional reclosing of the DC fuse switch disconnector, *see section 14.9.3, "Protect the DC Disconnector Against Unintentional Reclosing"*.

For detailed information regarding the DC fuse switch disconnector, refer to the original manufacturer manual (*see section 1.2 "Applicable Documents"*).

Figure 64: Circuit breaker components

14.9.2 Locking Device

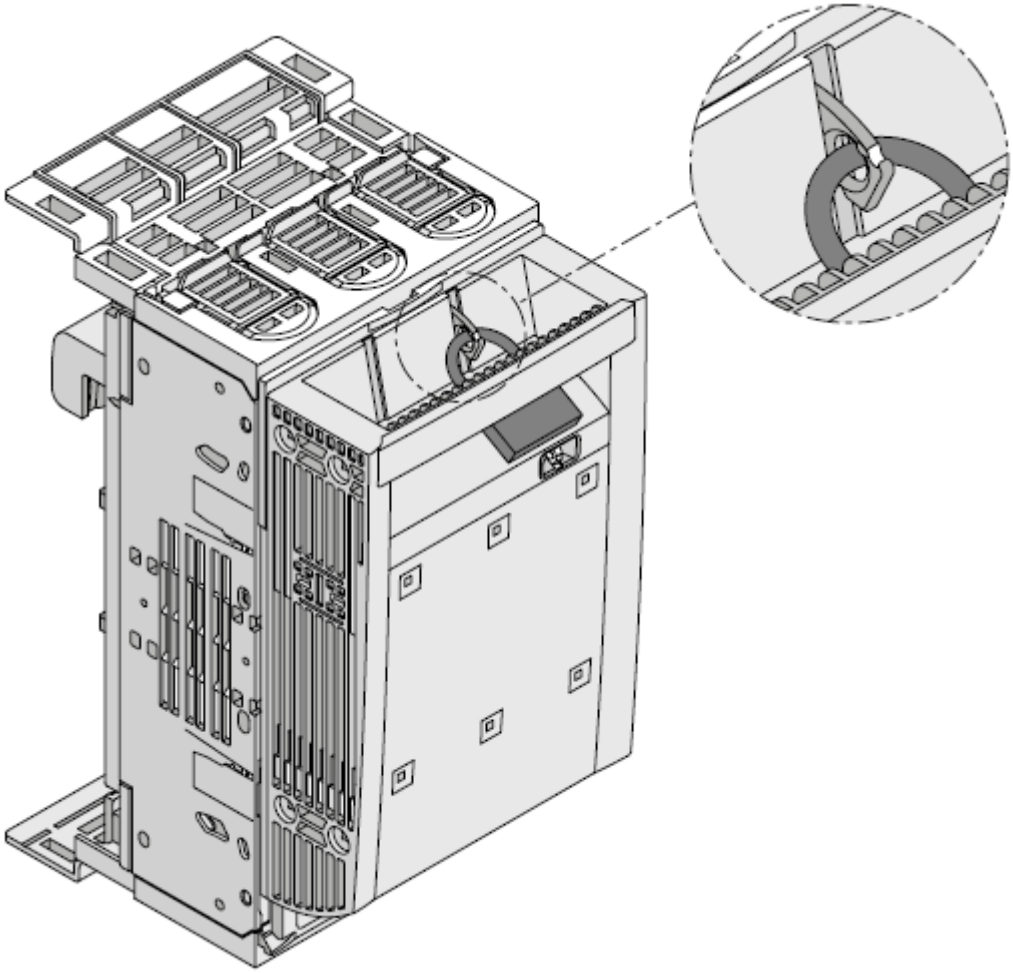

Figure 65: Locking device

14.9.3 Protect the DC Disconnector Against Unintentional Reclosing

You can lock the 3NP1 fuse switch disconnector to protect it against unauthorized actuation.
Either an eye (optional accessory, see below) and a padlock (shackle diameter: 6 mm) or two padlocks (shackle diameter: 2x 3 mm) are required for this purpose. The padlocks are not supplied with the fuse switch disconnector.

NOTICE
You can open the handle unit of a fuse switch disconnector that has been locked with an eye and one padlock by force in order to trip an emergency stop (rupture point on the eye).

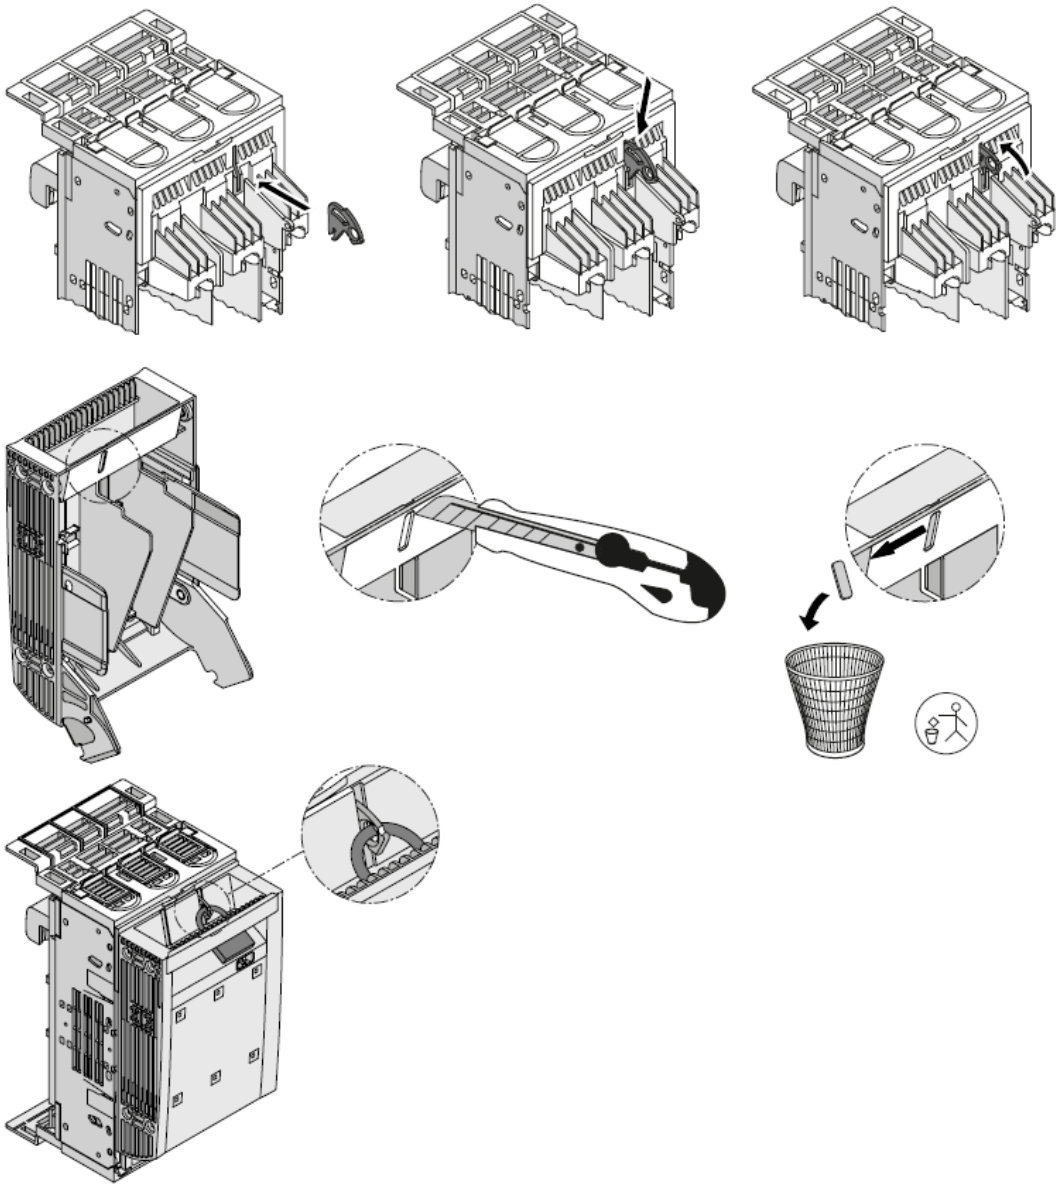

Figure 66: Secure fuse switch-disconnector against unintentional reclosing

15 Monitoring

PIII Converter Control Module

The converter system is equipped with two converter control interfaces.

PIII Indicator Lights

LED	Color	Label	Description
1	red	**UDC max**	DC-link voltage exceeded maximum value
2	red	**Imod max**	Current of one or more IGBT´s exceeded maximum value
3	red	**Error IGBT 1**	Error detected on IGBT 1
4	red	**Error IGBT 2**	Error detected on IGBT 2
5	red	**Error IGBT 3**	Error detected on IGBT 3
6	red	**Error IGBT 4**	Error detected on IGBT 4
7	red	**Error IGBT 5**	Error detected on IGBT 5

31	green	**UDC +**	DC link voltage is apparent
32	green	**Arc Detect**	Arc detection has tripped

Table 39: PIII indicator lights

16 Data transfer with higher-level controller

As described in section 4.2 "Data Interface", the BESS is controlled and monitored via the transfer of data with the customer's higher-level control system. Data transfer between BESS and the higher-level control system is performed via PROFINET protocol.

For external control and monitoring of the converter, it is necessary for the customer to have access to selected control and status variables stored in the converter controller, which can be read and overwritten by the customer's higher-level controller. For this purpose, predefined control profiles with the relevant control variables and status profiles with all relevant status variables are stored for the data transfer from BESS to the customer's higher-level controller.

For a detailed description of the individual data profiles, see Description of data profiles (*see section 1.2 "Applicable Documents"*).

17 Maintenance

The following describes the maintenance work that is necessary for trouble-free operation of the converter system (PCS) and Battery Energy Storage System (BESS). Maintenance intervals must be observed (*see section 17.2 "Maintenance* Schedule*"*).

If increased wear of individual components or functional groups is determined during regular inspections, the operator has to reduce the required maintenance intervals on the basis of the actual signs of wear. Changes compared to the normal operation (increased power consumption, temperatures, vibrations, noises, etc. or respond of monitoring systems) might indicate the functionality of the device is impaired. These then have to be subjected to an inspection by qualified personnel.

For information regarding maintenance of the BESS battery cabinets refer to document „20_Maintenance_Schedule“ (*see section 1.2 "Applicable Documents"*). Maintenance intervals provided in the maintenance schedule must be adhered.

⚠ DANGER	
	**Electric shock hazard!** **Do not perform maintenance work on a live system.** After switching off the converter, the DC-link of the converter still carries dangerous voltages, which may cause death or severe injuries if touched or short circuit. ➜ Before performing work on the converter, deenergize the converter, wait for 30 minutes until the installed capacitors are discharged and check the voltage-free status of the DC-link by using a 2-pole voltage tester. ➜ It is not allowed to open the cabinet doors before the converter system has been de-energized and the capacitors are discharged. ➜ It is not allowed to perform any work on the converter before the system has been de-energized.

⚠ DANGER	
	**Electric shock hazard!** **Do not perform maintenance work on the converter system, before the converter system has been disconnected from all power sources.** After switching off the converter, the connected DC power cables of the battery strings, the DC connection busbars in the AC_DC cabinet and the DC switch & fuse units continue to carry dangerous voltages that can cause death or serious injury if touched or short-circuited. ➜ Before starting work inside the converter cabinets, de-energize the converter system as described in section 14.6 “De-Energizing”, wait for 30 minutes until the installed capacitors are discharged and check the voltage-free status of the DC-link by using a 2-pole voltage tester. ➜ Disconnect the DC power cables from the converter system using suitable DC disconnecting devices before carrying out any work in the cabinets of the converter system. ➜ Before disconnecting the DC power cables from the DC connection busbars, always check for voltage-free status of the DC power cables, since dangerous electric arcs may lead to severe injuries or death when disconnecting the power cables.

⚠ DANGER	
	**Electric shock hazard!** **Do not perform any work on the MV switchgear and the MV transformer before the PLC container has been disconnected from all voltage sources.** After switching off the converter, the connected MV transformer, the MV switchgear, its connecting cables and terminals continue to carry dangerous voltages which, if touched or short-circuited, can cause death or serious injury. ➜ Before working on the medium voltage components of the converter container, de-energize the converter system as described in section 14.6 “De-Energizing”. ➜ Disconnect the AC mains connection by opening the MV switchgear. ➜ Before disconnecting the AC power cables from the AC connection busbars, always check the voltage-free status of the AC power cables, otherwise dangerous arcs can cause serious injury or death when disconnecting the power cables.

⚠ DANGER	
	**Electric shock hazard!** **Do not perform any maintenance work on the converter system before the AC circuit breaker and MV switchgear have been switched off and protected against unintentional reclosure.** ➜ Before starting work inside the converter cabinets, the AC circuit breaker 80Q1 must be switched off and protected against unintentional reclosure as described in section 14.8.3 “Protect the CB Against Unintentional Reclosing”. ➜ Before you start working inside the control cabinets, the medium-voltage switchgear must be switched off and protected against unintentional reclosure.

⚠ WARNING	
 	**Hazard by cooling liquid** The coolant used in the internal cooling system of the converter is harmful to human or animal health when touched or swallowed. ➜ Avoid oral ingestion of the coolant, since it can lead to harm to human or animal health. In case of accidental ingestion or eye contact with the coolant, seek immediate medical attention. ➜ Avoid skin contact with the coolant. ➜ Use appropriate eye protectors and protective gloves when working on the cooling system and during filling and draining of the cooling liquid.

NOTICE
Service and maintenance work on the BESS and cooling system must only be carried out by qualified and authorized personnel.

17.1 Preparations Prior Maintenance

The following safety precautions must be carried out before commencing service and maintenance work.

Non-observation of these safety instructions can cause injury to persons, damage to objects or malfunction or damage to the device itself.

Do not operate!	**Lock and tag power switches and controller devices**
⚠ DANGER 	Disconnect power and block operation controller devices. Follow national laws regarding Occupational Safety and Health. 1. Identify the energy source(s). 2. Isolate the energy source(s). 3. Determine voltage-free status. 4. Ground device or equipment to protect from short circuiting and from shocks. 5. Lock and Tag the energy source(s). 6. Prove that the equipment isolation is effective. 7. When required, apply lock-out device or clamp and secure with padlock(s).

17.2 Maintenance Schedule

Location	Component	Maintenance Work	Maintenance Interval	Description in
PCS Container CTRL cabinet	UPS battery	Functionality check	Once every 6 months	Section 17.3.1
PCS Container CTRL cabinet	UPS battery	Remove battery from battery unit	At storage temperatures below 0°C	Section 17.3.2
PCS Container All switch cabinets	Intake fan filters	Check the fan filters for contamination and replace if necessary	Once every 6 months	Section 17.4
All containers	Complete BESS system	Visual inspection	Once every 6 months / in case of a fault	Section 17.5
PCS Container CIR cabinet	Circuit breaker 3WL	Inspection	Once every 12 months	Section 17.6.1
		Replace arc-chute covers	After no more than three short-circuit interruptions	
		Replace arc chutes and contact system	Depending upon their condition	
		Replace operating system	Depending upon their condition	
PCS Container CTRL cabinet	PLC	Replace backup battery of Simotion PLC	Once every 4 years	Section 17.7
PCS Container COSY	Coolant	Exchange cooling liquid	Once every 5 years	Section 17.6
PCS Container COSY	Expansion vessel	Check pressure	Once every 5 years / When exchanging the cooling liquid / When error "pressure low" is apparent	Section 17.9
BESS Containers	Exhaust units	Inspection	Once every 6 months / in accordance with existing maintenance schedule	Section 17.11
BESS Containers	Fire dampers	Inspection	Once every 6 months / in accordance with existing maintenance schedule	Section 17.12
BESS Containers	H2 Sensors	Inspection	Once every 6 months	Section 17.13

Table 40: PCS Maintenance Schedule

17.3 UPS

17.3.1 UPS Functionality Check

(once every 6 months)

In order to check the functionality of the UPS device, the following steps must be performed:

Task 1: **Perform functionality check of the UPS device**

Step 1 : Set the main switch on the door of the control cabinet (*see figure 60,* ⑥) to the "OFF" position.

Step 2 : Locate the UPS module 102G1 inside the control cabinet (*see section 4.4.3*).
The yellow LED (*see figure below,* ④) on the front of the UPS module should glow, indicating that battery mode is active and the battery is discharging because the power supply is not available.

Step 3 : Wait for the buffer time set on the potentiometer on the front of the UPS module (②, default value: 6.6 min.).
During this time, check if the SoC bar graph (①) is displaying the current state of charge (SoC).

Note 4: During and after the test, the red LED (③) displaying an UPS alarm should not start glowing, since this would indicate an faulty or almost empty battery. In this case, the UPS battery must be replaced as described in the original manufacturer documentation.

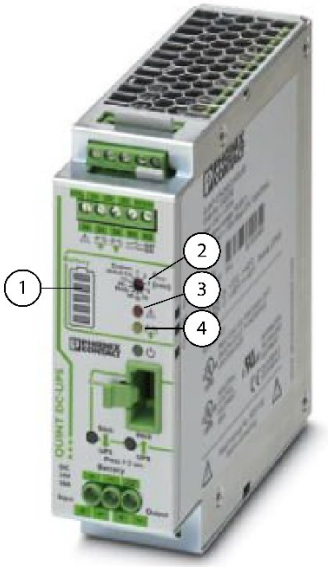

Figure 67: UPS module

Pos.	Description
①	Bar graph for displaying the current charging state of the power storage device
②	Buffer time setting: default: 6.6 min.
③	Red LED: alarm
④	Yellow LED: battery mode

Icon	Meaning of LEDs
⚠	Red LED on: UPS alarm due to one of the reasons: • battery almost empty • battery not detected • battery replacement required LED off: No UPS alarm, power supply available, normal operation.
🔋	Yellow LED on: Battery mode is ON, battery is discharging because power supply failed. LED off: Battery mode is OFF, i.e. mains available.
⏻	Green LED on: Mains is ON. LED off: Mains is OFF.

17.3.2 Removing the UPS battery

(At storage temperatures below 0°C)

NOTICE
The battery of the UPS unit must be removed at temperatures below 0°C.

In order to remove the battery from the energy storage device UPS-BAT/VRLA/24DC/12AH, the service mode of the UPS device must be activated.

Task 1: Activate service mode

The corresponding activation rights have to be granted for service mode activation and deactivation.

The service mode cannot be activated, while the QUINT-UPS runs in battery mode. The power supply must be available.

Step 1 : Depending on the granted activation rights, the service mode can be activated in three different ways:

1. By holding down both push buttons on the QUINT-UPS named "Stick -> UPS" and "UPS -> Stick" for at least 6 seconds.

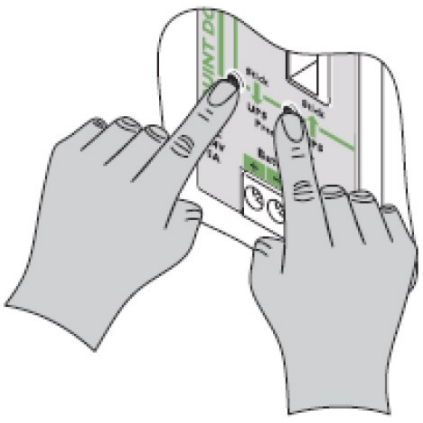

Figure 68: UPS control elements

2. By connecting a service stick (*see manufacturer manual*) to the Data port of the UPS.
3. By using the UPS-CONF (*see manufacturer manual*) software as follows:
   In the "Settings" group, select the "Service" item, and click the "On / Off" button near the "Activate service mode" text.

While the service mode is active

- the alarm status is activated,
- the charging current is interrupted,
- the status LED "Service mode active" in the UPS-CONF software ("Settings" group /"Service" item) is green

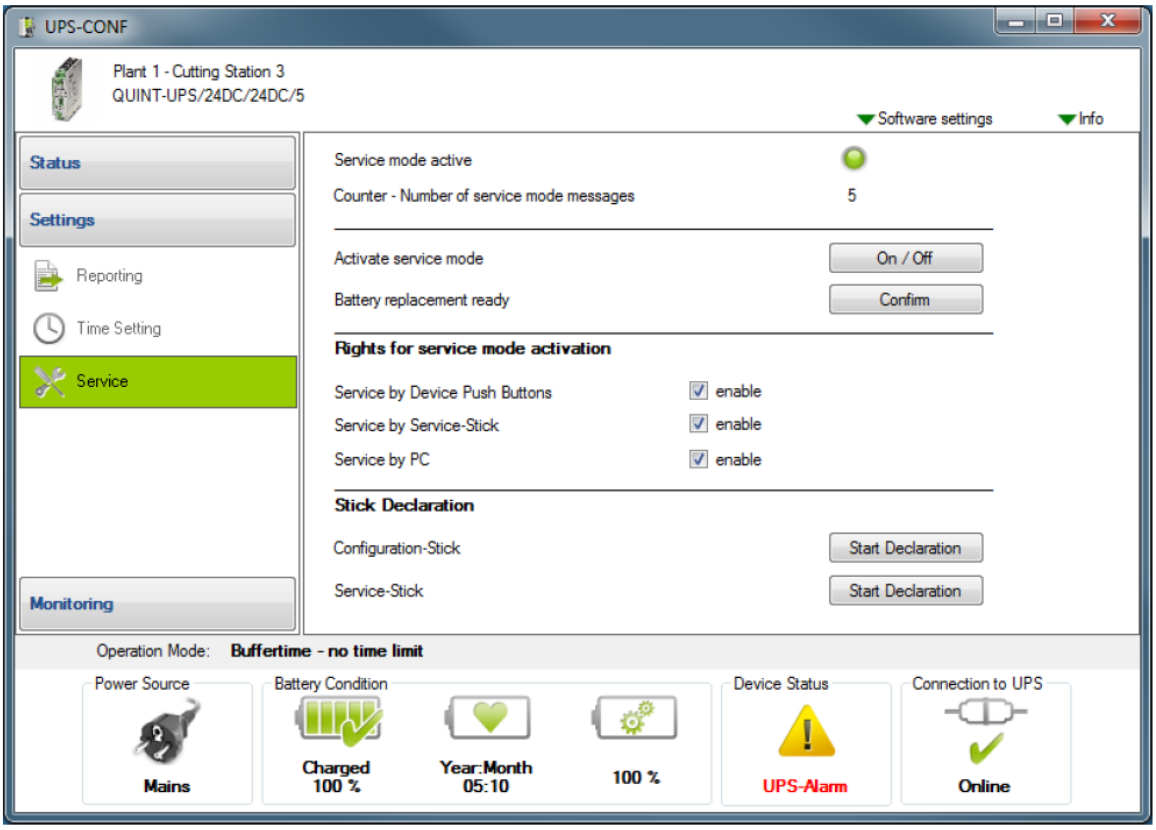

Figure 69: UPS CONF software

Task 2: Remove battery

⚠ DANGER
Before activating the service mode, read and obey carefully the safety instructions in the topic “Important safety notes” of the manufacturer manual.

⚠ DANGER
Watch polarity when connecting cables!

Step 1 : Activate the service mode by one of the ways described in Task 1.
Step 2 : Open battery module housing.
Step 3 : Remove fuses *(see illustration below)*.

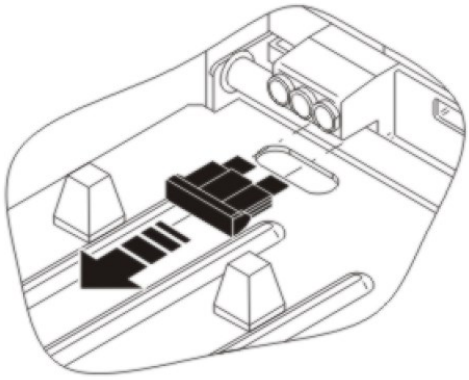

Figure 70: Remove UPS battery fuses

Step 4 : Remove cabling.
Step 5 : Remove battery.
Step 6 : Fix cabling inside housing.
Step 7 : Store the battery module together with the fuses.
Step 8 : Close battery module housing.

NOTICE
The battery and the fuses of the UPS unit must be reassembled before commissioning, recommissioning and operation of the MSC converter unit.

17.4 Changing the Intake Fan Filters

Check every 6 months, replace depending on degree of soiling)

The fan-and-filter unit and outlet filter are supplied as standard with a standard filter mat for the pre-filtering of dry, coarse dust and lint. In order to increase the protection category, and in the case of dust with a grain size of < 10 µm, we recommend the use of fine filter mats (optionally available).
The filter must be checked in regular intervals in accordance to the level of dust exposure and replaced as necessary.

⚠ DANGER

➜ Only change the filter mat while the fan rotor is stationary.
➜ Never insert your fingers into the fan rotor.

⚠ DANGER

The unit is live. Switch off the power supply before opening, and take suitable precautions against it being accidently switched back on.

NOTICE

Use only original Rittal filters which bear the Rittal logo in order to safeguard the designated protection category, air throughout and operating approvals.

To insert or replace the filter, proceed as follows (direction of airflow: drawing from outside and blowing into the enclosure):

Task 1: **Replace intake filter**
Step 1 : First press the catch of the louvred grill (Rittal logo) up slightly with one finger.
Step 2 : Once it is released, the louvred grill can be dropped open by approx. 70° or 90°.
Step 3 : If necessary, first place the fine filter mat into the housing.
Step 4 : Ensure that the open (roughened) side faces towards the louvred grill.
Step 5 : Insert the enclosed standard filter mat.
Step 6 : Ensure that the open side (without Rittal logo) faces towards the louvred grill.
Step 7 : Push the louvred grill back onto the enclosure until it snaps audibly into position.

17.5 Visual Inspection

(once every 12 months/in case of a fault)

Check the fan filters for contamination. Replace filters if necessary (*see section 17.4*).

Visually inspect the BESS cabinets for:

- Corrosion
- Damage
- Contamination

Electrical connections
Electrical connections must be checked for proper connection in order to ensure safe operation of the system and to prevent personnel from injuries due to electrical shock.

Corrosion
Corroded electrical connections must be replaced in order to maintain safe operation of the system and to prevent personnel from injuries due to electrical shock.

Damage
Damaged wires and clamps must be replaced immediately in order to maintain safe operation of the converter system and to prevent personnel from injuries due to electrical shock.

Contamination
Check the interior of the converter unit for contamination and dirt in order to prevent the internal components from short-circuiting and damage.

NOTICE
Do not use solvents for cleaning – especially on polycarbonate plastics. Use a vacuum cleaner to remove dirt or dust.

17.6 AC Circuit Breaker(s)

17.6.1 Inspection work

(once every 12 months)

The arc chutes and contact system of the circuit breaker(s) must be inspected according to these operation instructions. If a fault condition opens the circuit breaker(s), the circuit breaker(s) should be inspected before it is put back into service. Contact assemblies need to be changed according to their condition.

The switchgear operator has to determine inspection intervals depending on the breaker application conditions:

- min. 1 x per annum
- after interruption of heavy loads

During the inspection the following items must be examined:

- arc chutes and contact systems
- electrical and mechanical functionality of the breaker
- mechanical on- / off-functionality
- main and auxiliary circuits, function and connecting quality
- plausibility control of trip unit settings and correction, if necessary

Draw-Out guide frames with arc-chute covers installed, have to be replaced after no more than three short-circuit interruptions of the circuit breaker. If the breaker endurance is exhausted, then the breaker and old spare parts need to be disposed off, according to the effective legal regulations.
The arc chutes and the contact system must be replaced depending upon their condition.

Depending on the circuit breaker stress it may also be necessary to replace the operating system.

For detailed regarding the maintenance of the circuit breaker, refer to original manufacturers´ documentation (*see section 1.2 "Applicable Documents"*):

Document type	Document Name	File Name
Operating instructions	3ZX1812-0WL00-0AN4	3ZX1812-0WL00-0AN4_online_201806140915326928

17.7 Replace PLC Buffer Battery

17.7.1 Preventive maintenance

(every 4 years)

To maintain the high system availability, the manufacturer recommends the preventive replacement of the CMOS buffer battery, which is installed in the system PLC.

Component	Replacement interval
CMOS buffer battery	4 years

17.7.2 Replacing Backup Battery

NOTICE

The service life of the backup battery is approx. 5 - 8 years, depending on the ambient conditions.

Detailed information on maintenance can be found in the manufacturer's documentation for the Simotion P320-4 PLC *(see also section "Other applicable documents")*:

Document type	Document Name	File Name
Operating instructions	P320- 4 Commissioning and installation manual	P320_4_commissioning_en-EN

17.8 Exchanging the Cooling Liquid

(Every 5 years)

The cooling liquid inside the converter cooling system is to be exchanged as described in the following sections.

Like described in section 0, the converter cooling system is split up into two independent cooling systems for each converter system, allowing Converter System 1 and 2 independently from one another.

Therefore, each of the following steps must be performed for each cooling system separately.

NOTICE

- The cooling liquid inside the cooling system must be removed at least once every five years.
- Check the pressure on the expansion tank every time the cooling liquid is exchanged. The cooling system must be completely drained in order to perform a pressure check of the expansion tank (*see section17.9*).

NOTICE

The pump must not run dry as it might damage the pump.

17.8.1.1 Required Tools

The following table provides you with information regarding the tools required to perform maintenance work on the cooling system:

Amount	Tool	Description	Preferred Type	Manufacturer
3	Hose ½"	Length: 2 m, max. 50 bar	Variolux Silverline	Gardena
1	Filling pump	For glycol use, min. 2 bar pressure	Unistar 2000 A	ZUWA
1	Cooling liquid vessel	Min. 55 l capacity		
1	Inlet pressure gauge	For expansion tanks, digital	Art. No.: 512240122	OEG
1	Tank filler 400 ml	For increasing and testing the pressure in expansion tanks	Art. No.: 311779100	OEG
1	Adapter for tank filler	Adapter for screwing on the tank filler can	Art. No.: 512240126	OEG

Table 41: Required tools for cooling system maintenance

17.8.1.2 Allowed Coolants

The following table lists the suitable coolants for using in the cooling system. When exchanging the cooling liquid of the cooling system, only use a coolant listed in the table.

Please observe the manufacture's information regarding the cooling range of the designated cooling liquid.

Manufacturer	Type
NALCO AG	Varidos FSK
BASF AG	Glysantin G30
Clariant	Antifrogen N
Clariant	Antifrogen L
DOW	Dowcal 20
Zitrec	M-25 C

Table 42: Allowed coolants

17.8.1.3 Draining the cooling system

NOTICE

Check the pressure on the expansion tank every time the cooling liquid is exchanged. The cooling system must be empty in order to perform a pressure check of the expansion tank (*see section 17.9*).

⚠ WARNING

Hazard by cooling liquid

The coolant used in the internal cooling system of the converter is harmful to human or animal health when touched or swallowed.

- ➜ Avoid oral ingestion of the coolant, since it can lead to harm to human or animal health. In case of accidental ingestion or eye contact with the coolant, seek immediate medical attention.
- ➜ Avoid skin contact with the coolant.
- ➜ Use appropriate eye protectors and protective gloves when working on the cooling system and during filling and draining of the cooling liquid.

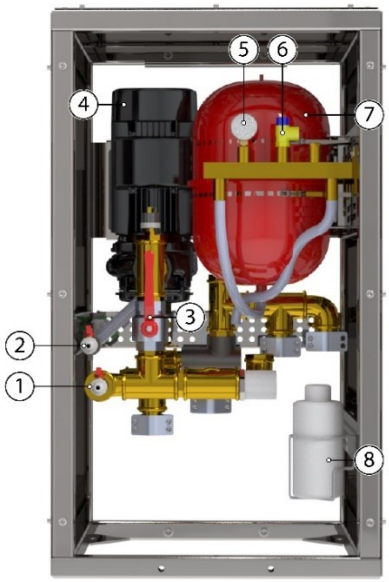

Figure 71: Cooling system components inside cooling system cabinet (COSY)

Pos.	Cooling system components
①	¾“ inlet flow connection with valve
②	"¾“ return flow connection with valve
③	Stop cock
④	Coolant pump
⑤	Manometer
⑥	Overpressure valve
⑦	Expansion vessel
⑧	Overflow vessel

Table 43: Cooling system components

Task 1: **Draining the cooling system**

Step 1 : Connect a pressure hose to the return flow connection of the cooling system inside the COSY cabinet (*see figure 71,* ②) and lead the end of the hose inside a suitable vessel.

Step 2 : Open the return flow valve (②).

Step 3 : The cooling liquid drains through the hose inside the vessel.

Step 4 : Wait until the cooling system is completely drained and then check it for any liquid remaining in the system.

17.8.2 Filling the Cooling System

⚠ WARNING	
	**Hazard by cooling liquid** The coolant used in the internal cooling system of the converter is harmful to human or animal health when touched or swallowed. ➜ Avoid oral ingestion of the coolant, since it can lead to harm to human or animal health. In case of accidental ingestion or eye contact with the coolant, seek immediate medical attention. ➜ Avoid skin contact with the coolant. ➜ Use appropriate eye protectors and protective gloves when working on the cooling system and during filling and draining of the cooling liquid.

Task 1: **Prepare Coolant**

Step 1 : The expansion tank must be pre-charged to 1 bar at approx. 20 °C on the gas side.

Step 2 : Use a suitable container to prepare approx. 55 liters of coolant with a ratio of 60% water and 40% glycol (with Antifrogen N). The actual amount needed depends on the length of the hoses used to connect the heat exchanger.

Step 3 : Open the cooling liquid container (e.g. Antifrogen N) and place it in close proximity to the converter cooling system.

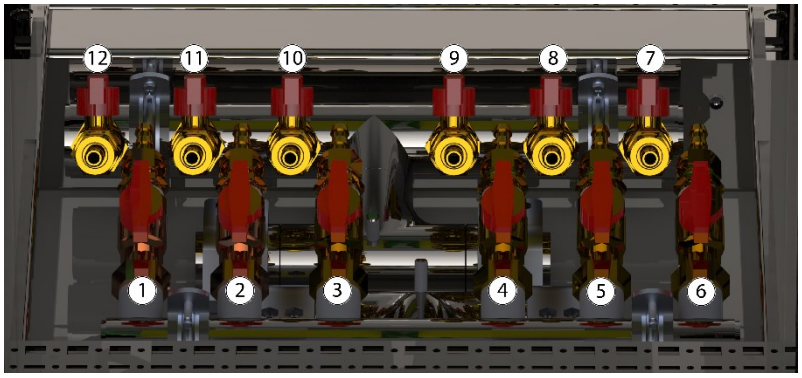

Figure 72: Water distributor, connections and valves in CON Cabinet

Pos.	Cooling System Component
①	Sub circuit with valve 1 - inlet flow
②	Sub circuit with valve 2 - inlet flow
③	Sub circuit with valve 3 - inlet flow
④	Sub circuit with valve 4 - inlet flow
⑤	Sub circuit with valve 5 - inlet flow

⑥	Sub circuit with valve 6 - inlet flow
⑦	Sub circuit with valve 6 - return flow
⑧	Sub circuit with valve 5 - return flow
⑨	Sub circuit with valve 4 - return flow
⑩	Sub circuit with valve 3 - return flow
⑪	Sub circuit with valve 2 - return flow
⑫	Sub circuit with valve 1 - return flow

Table 44: Cooling system – Coolant dispenser connections and valves inside CON cabinet

Task 2: Fill cooling system

NOTICE

Make sure that the pressure and suction hoses are completely immersed in the cooling liquid inside the cooling liquid container throughout the whole filling process, to avoid suction of air into the cooling circuit.

Step 1 : Connect the external filling pump and the cooling liquid canister using a suction hose.

Step 2 : Connect the external filling pump to the inlet flow connection *(see figure 71, ①)* with a pressure hose.

Step 3 : Open the valve on the top of the heat exchanger - if there are several heat exchangers, the valve of each heat exchanger must be opened *(see illustration below)*.

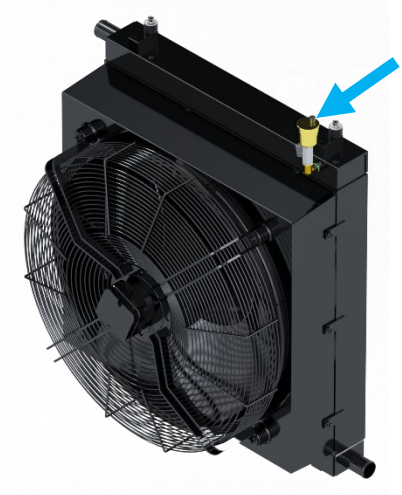

Figure 73: Valve on heat exchanger

Step 4 : Connect the return flow connection (*see figure 71,* ②) and the coolant canister with a pressure hose.

Step 5 : Close ALL valves of the sub-circuits on the water distributor of the CON cabinet (*see figure 72* ① - ⑥, ⑦ - ⑫).

Step 6 : Open the stop cock of the converter cooling system (*see figure 71,* ③).

Step 7 : Open the valves on the inlet flow connection and on the return flow connection.

Step 8 : Switch on the external filling pump and make sure that the intake hose is completely immersed in the cooling liquid inside the cooling liquid canister, so no air is sucked into the cooling circuit.

Step 9 : The main cooling circuit will be filled with coolant and the air will be removed from the circuit during this time. Wait until no more air bubbles are inside the cooling liquid canister.

Step 10 : Open the inlet flow and return flow valves of sub-circuit 1 (*see figure 72,* ① *and* ⑫).

Step 11 : Wait for 3 minutes. The sub cooling circuit will be filled with coolant and the air will be removed from the circuit during this time.

Step 12 : Shut off the inlet and return flow valve of sub circuit 1.

Step 13 : Proceed the same way for the remaining IGBT cooling circuits inside the CON cabinet.

Step 14 : Proceed the same way for the cooling circuits inside the IND cabinet.

Step 15 : Close the stopcock (*see figure 71,*③).

Step 16 : Open the valves of all connected sub-circuits.

Step 17 : Close the valve of the return flow connection (*see figure 71,* ②).

Step 18 : Wait until a pressure of 3 bar is indicated by the cooling systems´ manometer (*see figure 71,* ⑤). As soon as 3 bar have been reached, immediately shut off the inlet flow valve (*see figure 71,* ①).

Step 19 : Shut-off the external filling pump, but make sure the suction and pressure hose are still immersed in the cooling liquid inside the cooling liquid container.

Step 20 : Activate the coolant pump of the cooling system by switching on the motor protection circuit breaker 181Q1 inside the control cabinet and activate the contactor 139K2 inside the control cabinet using a suitable insulated tool.

Step 21 : Let the coolant pump run for 120 min.

Step 22 : Close the valve on the top of the heat exchanger(s) (*see figure 73*).

Step 23 : Deactivate the coolant pump of the cooling system by removing the insulated tool.

Step 24 : Check if the pressure on the cooling system manometer is indicated with 3 bar.

Step 25 : If the pressure indicated by the manometer is below 3 bar, switch the external filling pump back on an open the inlet flow valve.

Step 26 : As soon as a pressure of 3 bar has been reached, immediately shut-off the inlet flow valve and switch off the external filling pump.

Task 3: Perform a visual check of the entire cooling circuit for leaks.

17.9 Check pressure of expansion tank

Once every 5 years / When exchanging the cooling liquid / When error "pressure low" is apparent

NOTICE

The cooling system must be empty in order to perform a pressure check of the expansion tank (*see section 17.9*).

➜ Check the pressure on the expansion tank every time the cooling liquid is exchanged.

⚠ WARNING

Before performing maintenance work, make sure the system is off, cooled and not pressurized, all the electric parts are not energized, and the vessel is completely empty.

Maintenance of the expansion tank is to be performed according to the manual of the manufacturer.
ZILMET: manual_expansion_tank_537L_zilmet

Perform a pressure check of the expansion, checking that the pre-charge is at 1.5 bar.

- At least once every 5 years
- whenever the coolant of the water-cooling system is exchanged
- when converter controller reports the error message “pressure low”

The cooling system must be reduced to 0 bar in order to perform a pressure check of the expansion tank. **The necessary gas pressure is 1.5 bar**. If necessary, refill gas to 1.5 bar with compressed nitrogen. Exceptionally, the expansion tank can be filled up with compressed air. At the next maintenance the gas pre-charge pressure must be corrected with nitrogen.
The filling valve is similar to a filling valve of a car tire. Check the pressure with a tire gauge. Avoid unnecessary gas losses during testing.
See instructions below on how to perform a pressure check of the expansion tank and how to refill gas if necessary.

Task 1: **Check pressure of expansion tank**
In order to check the pressure of the expansion tank, the coolant inside the cooling systems´ circuits must be drained, until the manometer of the water-cooling system indicates a pressure of **0 bar**.

Step 1 : Drain the converter´s water cooling system like explained in section 17.8.1.3 until the manometer of the cooling system indicates a system pressure of 0 bar.

Step 2 : Connect the supplied tank filler with manometer and adapter (*see figure 75*) to the filling valve connection of the expansion vessel (*see figure 74*) and check if the nominal pressure of 1.5 bar is apparent.

Figure 74: Filling valve connection on expansion tank

Figure 75: Tank filler with manometer and adapter

NOTE: If the pressure indicated by the pressure gauge is below 1.5 bar, refill the expansion tank with gas, as described in the following:

Task 2: **Refill gas of expansion tank to 1.5 bar**

Step 1 : Connect the supplied tank filler with manometer and adapter to the filling valve connection of the expansion tank.

> **⚠ WARNING**
>
> Hold the tank filler bottle in upright position during the filling process. Don´t hold the bottle horizontally or tip the bottle during the filling process, since it could lead to injuries due to bursting material.

Step 2 : Refill gas until the connected pressure gauge is indicating a pressure of 1.5 bar.

Task 3: **Refill converter cooling system with coolant**

Step 1 : Refill the converter water-cooling system with cooling liquid like described in section 17.8.2 until the manometer of the water-cooling system indicates a pressure of 3 bar.

Step 2 : Let the coolant pump run for at least 1 hour.

Step 3 : Turn off- the internal coolant pump and check if the pressure indicated by the cooling system manometer is 3 bar.

Note: If the pressure is below 3 bar, refill cooling liquid until a pressure of 3 bar is indicated by the manometer of the water-cooling system.

17.10 Pump

⚠ WARNING

Make sure that escaping cooling water does not cause injury to persons or damage to the equipment.

- The internal pump parts are maintenance-free.
- It is important to keep the motor clean in order to ensure adequate cooling of the motor.
- If the pump is installed in dusty environments, it must be cleaned and checked regularly.
- Take the enclosure class of the motor into account when cleaning.
- The motor has maintenance-free, greased-for-life bearings.
- Pump bearings and shaft seal are maintenance free.

Maintenance of the pump is to be performed according to the manual of the manufacturer

Manufacturer:	Grundfos
Type:	CM10-2 A-R-A-E-AQQE
Manufacturer article no.:	99080211

Frost Protection

NOTICE

Before start-up after a period of inactivity, the pump and the suction pipe should be completely filled with liquid.

Pumps which are not being used during periods of frost should be drained to avoid damage.
Remove the filling and drain plugs from the pump (*see illustration below).*

Do not refit the plugs until the pump is taken into operation again.

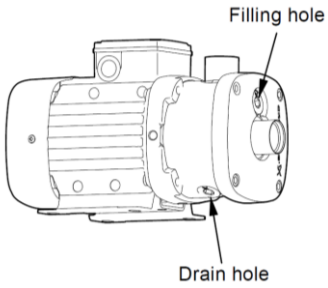

Figure 76: Position of filling hole and drain hole

17.11 Exhaust Units

Once every 6 months / fit in with existing service and maintenance plan

Periodically the extract unit must be electrically tested to ensure that the supply to the unit is continuous and that mechanically the FSD and motor open and close effectively.

It is recommended that this test be carried out twice yearly or to fit in with existing service and maintenance contracts.

The air flow failure switch should be checked for free movement and electrical conductance.

Refer to Puma technical sales leaflet for further information regarding dimensions, weights and unit performance and fan curves.

17.12 Fire Dampers

Once every 6 months / fit in with existing service and maintenance plan

The damper and motor require no service as such, but a periodic mechanical and electrical test of the working mechanisms should be carried out at least twice yearly, or to coincide with existing service and maintenance contracts.

See appropriate certified drawing of units for further information re: sizes etc.

17.13 H2 Sensors

Once every 6 months

The inspection must be carried out by trained service personnel.

The inspection intervals must be established in each individual case and shortened if necessary, depending on technical safety considerations, engineering conditions and the technical requirements of the equipment.

Contact Dräger service if you wish to take out a service contract and have any repairs carried out.

18 Container Repair

In case the container surface is damaged, repair the damaged surface as described in the following, to maintain the surface protection of the container.

18.1 Process Instructions (New Application)

Surface preparation according to DIN EN ISO 12944-4 sandblasting to surface preparation standard SA 2.5 (40 µm minimum roughness depth, medium roughness grade (G), angular blasting grit).

Primer:
REESA 2K-HS-Filling-Primer ZP
Material Nr.: 3D061
Color: ca. RAL 7035
Dry film thickness (DFT): 80 - 100 µm

Application process: spray application
Compressed air spraying, airless-spraying or electrostatic spraying according to technical data sheet.

- Processing is possible above ä minimum temperature of +8 °C. The critical dew point temperature must be exceeded by 3 °C.
- The mixing process of the 2K material must be carried out according to the enclosed technical data sheet.
- After a period of seven hours the mixed material must no longer be used and has to be disposed of, according to the legal regulations.

Topcoat:
REESA 2K-HS-PUR-OneCoat-Paint
Material Nr.: 6D062
Color: n. a.
Dry film thickness: 60 µm

Application process: spray application
Compressed air spraying, airless-spraying or electrostatic spraying according to technical data sheet.

- Furthermore, a forced drying period of 60 minutes at a temperature of +60 °C is possible. Processing is possible above ä minimum temperature of +8 °C. The critical dew point temperature must be exceeded by 3 °C. The complete reaction period of the topcoat is 7 days.
- The mixing process of the 2K material must be carried out according to the enclosed technical data sheet.
- After a period of seven hours the mixed material must no longer be used and has to be disposed of, according to the legal regulations.

18.2 Process instructions (Repair - damage down to the steel)

Surface preparation according to DIN EN ISO 12944-4 surface preparation standard PSt2:

- Removal of loose and labile coating particles.
- Removal of rust using a wire brush or sandpaper (grain size 180).
- Surface grinding of the damaged and uneven areas, as well as edge areas, using sandpaper (grain size 180) until even.
- Removal of all foreign and separating substances.

Primer:
REESA 2K-HS-Filling-Primer ZP
Material nr.: 30061
Color: ca. RAL 7035
Dry film thickness: 80 - 100 µm

Application process: spray application
Compressed air spraying, airless-spraying or electrostatic spraying according to technical data sheet.

Application process: brush application
Up to 3 coats may be required to achieve the DFT.
Intermediate drying time of the individual coats: 30 min.
Drying time between primer and topcoat: 2 hours.

- Processing is possible above ä minimum temperature of +8 °C. The critical dew point temperature must be exceeded by 3 °C.
- The mixing process of the 2K material must be carried out according to the enclosed technical data sheet.
- After a period of seven hours the mixed material must no longer be used and has to be disposed of, according to the legal regulations.

Topcoat:
REESA 2K-HS-PUR-One-Coat-Paint
Material Nr.: 60062
Color: n. a.
Dry film thickness: 60 µm

Application process: spray application
Compressed air spraying, airless-spraying or electrostatic spraying according to technical data sheet.

Application process: brush application
Up to two coats may be required to achieve the DFT.
Intermediate drying time of the individual coats: 30 min.

- Furthermore, a forced drying period of 60 minutes at a temperature of +60 °C is possible. Processing is possible above ä minimum temperature of +8 °C. The critical dew point temperature must be exceeded by 3 °C. The complete reaction period of the topcoat is 7 days.
- The mixing process of the 2K material must be carried out according to the enclosed technical data sheet.
- After a period of seven hours the mixed material must no longer be used and has to be disposed of, according to the legal regulations.

18.3 Process instructions (Repair - damage only within the topcoat)

Surface preparation according to DIN EN ISO 12944-4 surface preparation standard PSt2:

- Removal of loose and labile coating particles.
- Surface grinding of the damaged and uneven areas, as well as edge areas, using sandpaper (grain size 180) until even.
- Removal of all foreign and separating substances.

Topcoat:
REESA 2K-HS-PUR-One-Coat-Paint
Material Nr.: 60062
Color: n. a.
Dry film thickness: 60 - 80 µm

Application process: spray application
Compressed air spraying, airless-spraying or electrostatic spraying according to technical data sheet.

- Furthermore, a forced drying period of 60 minutes at a temperature of 60 °C is possible. Processing is possible above ä minimum temperature of +8 °C. The critical dew point temperature must be exceeded by 3 °C. The complete reaction period of the topcoat is 7 days.
- The mixing process of the 2K material must be carried out according to the enclosed technical data sheet.
- After a period of seven hours the mixed material must no longer be used and has to be disposed of, according to the legal regulations.

19 Settable Devices

The following table provides the manufacturer settings of the components listed in the table.

Location	Identifier	Settable Device	Setting
CIR	80Q1	AC circuit breaker 3WL I_N=1250 A / 690 V	$I_R = I_N \times 1.0$ $I_i = I_N \times 2.0$
CTRL_1	101Q1	Circuit-breaker for motor protection, 2.2 ... 3.2 A	3 A
CTRL_1	181Q1	Circuit-breaker for motor protection, 3.5 ... 5 A	5 A
CTRL_1	181Q2	Circuit-breaker for motor protection, 4.5 ... 6.3 A	4.5 A
CTRL_1	182Q1	Circuit-breaker for motor protection, 3.5 ... 5 A	5 A
CTRL_1	185B1	Thermostat -10°C … +50°C	15°C
CTRL_1	186B1	Thermostat -10°C … +50°C	5°C
CTRL_1	102G1	USV QUINT 24 V DC / 20 A	6.6 min
CTRL_1	101T1	TRIO-PS/3AC/24DC/40	26 V DC
BESS_1	101T1	TRIO-PS/3AC/24DC/40	26 V DC
BESS_1	101Q1	Circuit-breaker for motor protection, 2.2 ... 3.2 A	3 A
BESS_1	102G1	USV QUINT 24 V DC / 20 A	6.6 min
BESS_2	101T1	TRIO-PS/3AC/24DC/40	26 V DC
BESS_2	101Q1	Circuit-breaker for motor protection, 2.2 ... 3.2 A	3 A
BESS_2	102G1	USV QUINT 24 V DC / 20 A	6.6 min

Table 45: Settable devices

20 IP Addresses

The following table provides the IP-addresses set at delivery state of the listed components.

Component	IP Address
Main controller P320	192.168.5.10

Table 46: IP addresses of components

21 PLC

The following sections provide you with a description of the connection elements and the indicator lights of the PLC and gives you information regarding the handling of the unit.

For further information regarding the PLC, see device manual SIMOTION_P320-4 of the manufacturer.

21.1 Indicator Lights

The following table describes the indicator lights at the front panel of the P320 PLC.

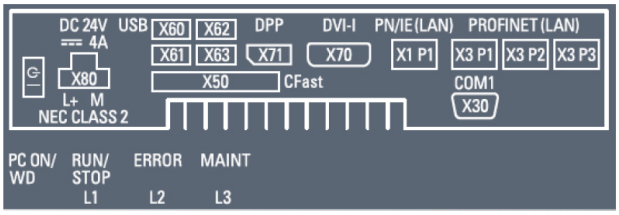

Figure 77: P320 PLC indicator lights

LED	Significance	State	Description
PC ON/ WD	Power supply	Green	BIOS ready to boot. Indicates the correct supply voltage of 3.3 V, 5 V and 12 V from the integrated power unit.
		OFF	Not relevant.
		Green/yellow flashing (1 Hz)	BIOS in POST, power switch on.
		Yellow	Idle state
RUN/STOP or L1	RUN STOP	Off	SIMOTION P Runtime is not running.
		Green	SIMOTION P320-4 in RUN.
		Yellow	SIMOTION P320-4 in STOP.
		Green/yellow: Flashes quickly (2 Hz)	DCP flashing
		Yellow: Flashes quickly (5 Hz)	FAULT state (only in combination with L2 and L3)
ERROR or L2 (SF PROFINET LED)	-	Off	SIMOTION P320-4 is working error-free.
	Error	Red: Continuous light	Bus error at the PROFINET interface.
		Red: Flashes quickly (2 Hz)	Erroneous configuration.

		Red: Flashes quickly (5 Hz)	FAULT state (only in combination with L1 and L3)
	INIT	Red: Flashes slowly (0.5 Hz)	During the INIT process, the SF PROFINET LED is con- trolled by the boot loader. The precise flashing behavior therefore cannot be determined and displayed. In the INIT state, 0.5 Hz flashing is displayed in the SI- MOTION P State. If no project has yet been loaded, 0.5 Hz flashing is also displayed for the INIT, which, in this case, is also retained in the Running state.
MAINT or L3 (SF LED)	-	Off	SIMOTION P320-4 is working error-free.
	Error	Red	An event has occurred which needs to be acknowledged (alarm, message, notification). (See Diagnostics Guide)
		Red: Flashes slowly (0.5 Hz)	License missing for licensed technology objects. Carry out the licensing to correct the error. Further information on the licensing can be found in the SIMOTION P320-4 E / SIMOTION P320-4 S Commissioning and Hardware Installation Manual.
		Red: Flashes quickly (5 Hz)	FAULT state (only in combination with L1 and L2) A fault has occurred to which the user program cannot respond. The following actions may be required to rectify the fault: ● Power OFF/ON ● Recommissioning

Table 47: P320 Indicator lights

21.2 Connection Elements

The following table describes the connection elements at the back side of the P320 PLC.

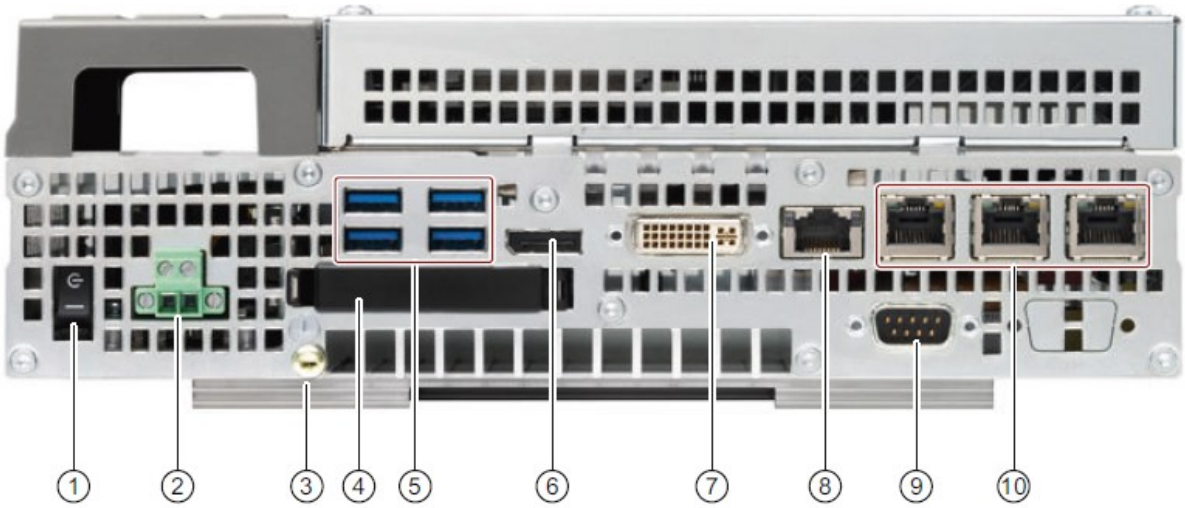

Figure 78: PLC connection elements

Pos.	Description	Description
①	On/off switch	Position OFF is the delivery state. The on/off switch does not isolate the device from the power supply.
②	24 VDC	24 VDC power supply connection
③	Protective conductor	Protective conductor terminal
④	Memory card slot	Cover for the CFast card
⑤	4 × USB 3.0	USB 3.0 high current, backward compatible with USB 2.0/1.1
⑥	Display port	Display port connection for digital monitor
⑦	DVI-I	DVI connector for CRT or LCD monitor with DVI interface
⑧	Ethernet	RJ45 Ethernet connection for 10/100/1000 Mbps
⑨	COM1	Serial interface
⑩	3 × PROFINET	PROFINET ports with three RJ45 sockets

Table 48: Table 38: PLC connection elements

21.3 PLC Connection

Follow the following steps to connect to the main PLC via PC or laptop.

Task 1: **Establish a connection to the PLC via PC or Laptop.**

Step 1 : Connect a PC or laptop via Ethernet cable to port X5 of Ethernet Switch 111A1 inside the CTRL cabinet (*see illustration below*).

Note 1: The connected PC or laptop and the converter PLC must be set to the same IP range.

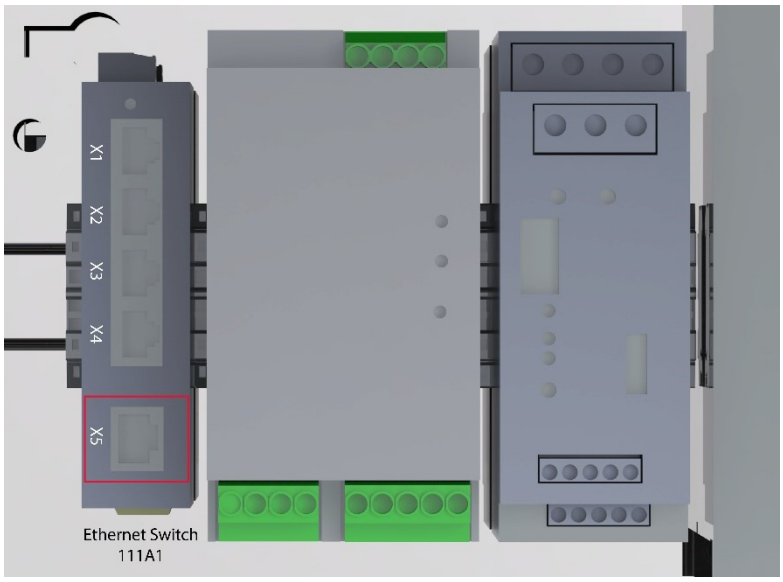

Figure 79: Ethernet Switch 111A1 - Port X5

21.4 Compiled Project Update

In case the PLC control software is not up to date at the time of commissioning, the control software must be updated.

Follow the following steps to perform a compiled project update of the main PLC.

Task 1: **Access the PLC user interface**
Step 1 : Connect to the PLC like described in section 21.3 “PLC“.
Step 2 : Open a web browser of your choice on the connected PLC or laptop
Step 3 : Type in the IP address of the PLC in the address field of your PC´s or laptop´s browser, followed by **/index.mwsl**.

Beispiel 1: 192.168.5.10/index.mwsl

The main controllers´ IP address set at delivery state is provided in Table 46.

Step 4 : The Simotion page “Home” will be displayed in the web browser of the connected PC or laptop.
✓ **The PLC user interface has been successfully accessed.**

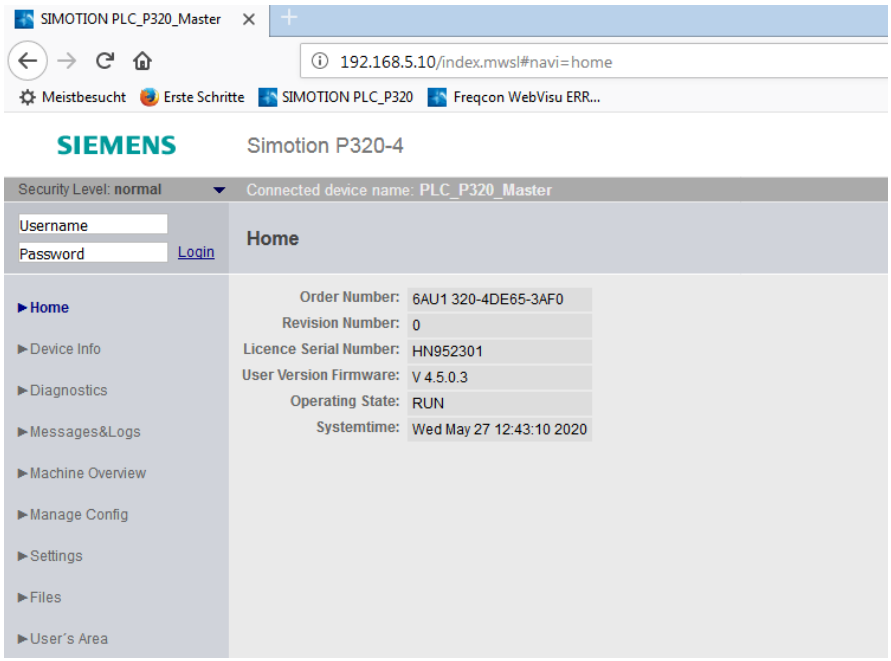

Figure 80: Connecting to the PLC user interface

Task 2: **Stop SIMOTION P320 operation.**

Step 1 : Connect to the PLC like described in section 21.3 “PLC“.

Step 2 : Select the "Settings" tab on the left-hand side of the visualization page (*see figure below,* ①).

Step 3 : In the new window, enter the following user data in the fields provided (case-sensitive):

Username: simotion

Password: simotion

Step 4 : Stop the PLC from running by clicking on the "STOP" button (②).

✓ **The PLC has been successfully stopped from operation.**

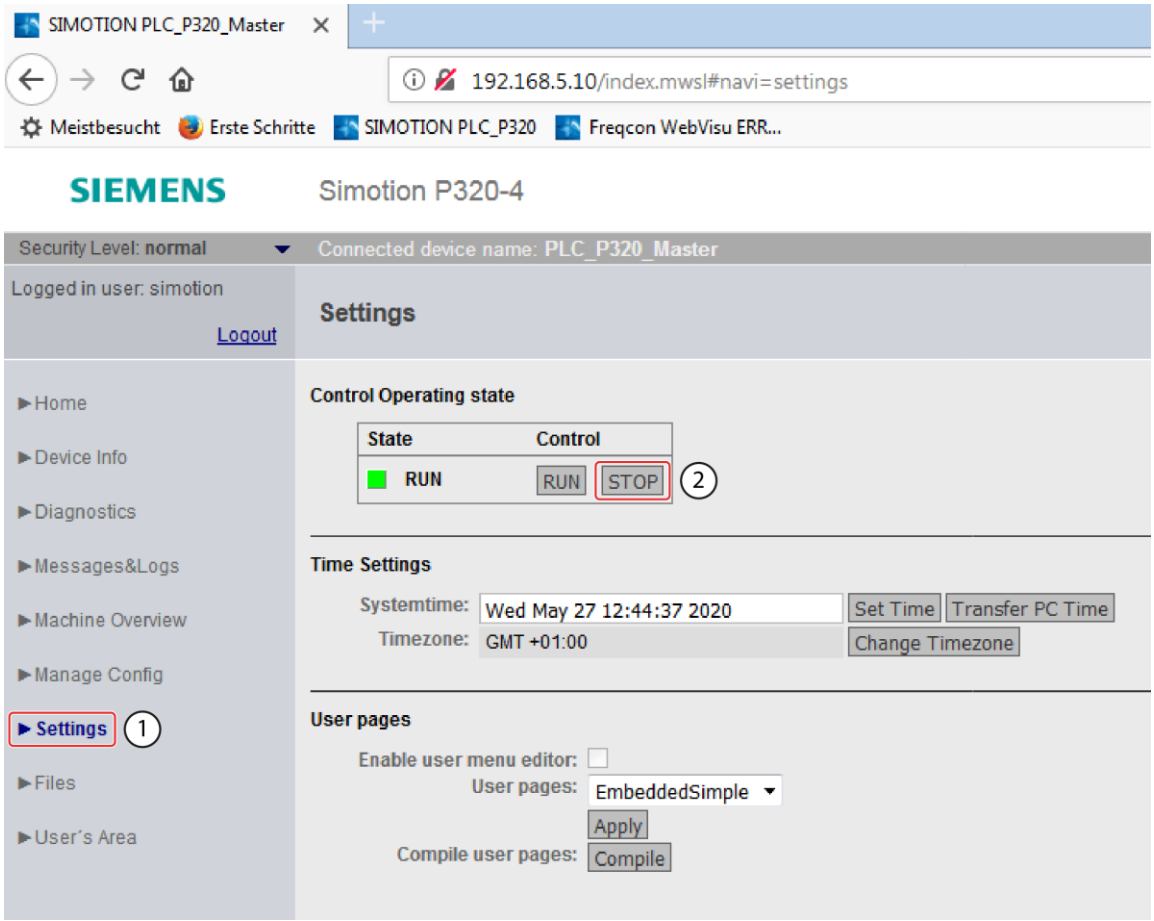

Figure 81: „Settings“ page

Task 3: **Load the compiled project ZIP archive to the SIMOTION P320 PLC**

Step 1 : Select “Manage Config” on the left site of the page (see *figure* below , ③).

Step 2 : Load the compiled project to the system by selecting the folder symbol (④).

Step 3 : Transfer the compiled project to the PLC by selecting the "Send update data" button (⑤).

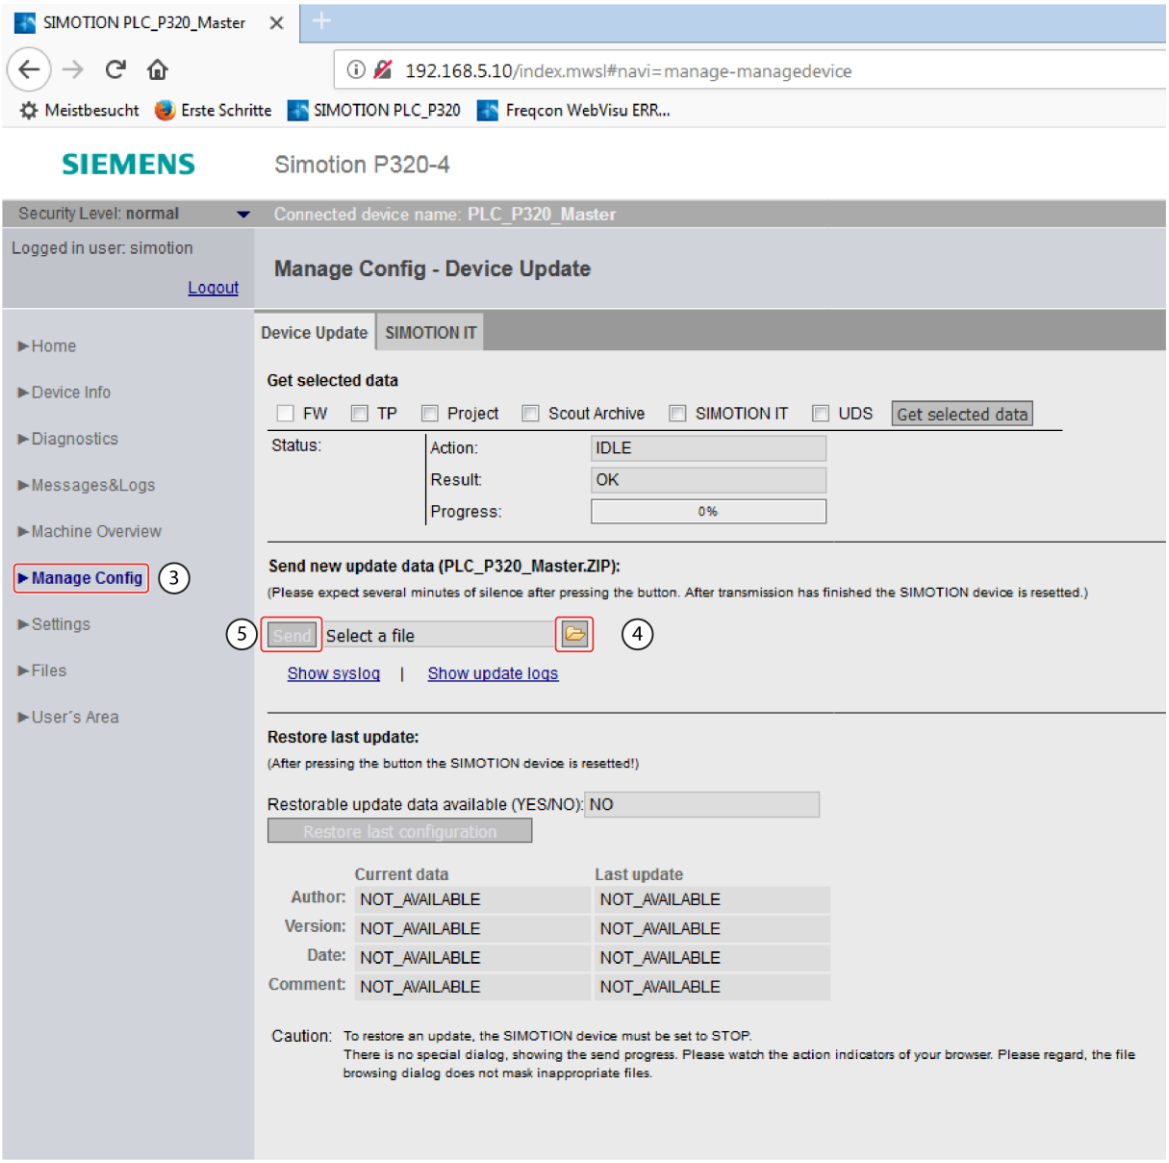

Figure 82: "Manage Config" page

Step 4 : Wait until the confirmation screen appears. The PLC reboots.

Step 5 : Wait for 5-7 minutes until the PLC has completed the reboot process.

Step 6 : Select the "Settings" tab.

Step 7 : Start the PLC by selecting the "RUN" button.

✓ **The PLC software has been successfully updated.**

22 WebVisu

FREQCON Web Visualization (WebVisu) provides granular control, real-time monitoring and visualization of key BESS functions. The WebVisu can be accessed either via the HMI touch panel on the control cabinet of the BESS or via a remote connection using a PC or laptop *(see section 22.1 "WebVisu remote connection")*.

The following sections provide you with information on handling and functionality and offer information on the individual WebVisu pages:

- Overview
- Overview DC-DC
- AC-DC Converter
- DC Link
- DC-DC Converter
- Converter Control
- Cooling
- Battery Overview
- Grid Protection Settings
- Init List
- Error List
- Action List

The individual pages can be selected by using the corresponding navigation buttons on the left side of every WebVisu page.

Note:

- Fields highlighted in grey can be adjusted by entering values inside the fields. Adjusted values are accepted by pressing the "Enter" key.
- Values must be entered in the fields without a unit.
- Fields with a white background indicate actual values.
- The selection of individual WebVisu pages depends on the user rights of the currently logged in user profile.

22.1 WebVisu remote connection

To connect to the WebVisu of the BESS via remote connection, carry out the following steps:

Task 1: **Establish a remote connection to the WebVisu of BESS**

Step 1 : Establish a connection to the PLC (main controller) in the control cabinet of the BESS by connecting a PC or laptop to the RJ45 socket of the network isolator (113T1) using an Ethernet cable.

Note 1: The connected PC or laptop and the PLC must be in the same IP range.

Step 2 : Open a web browser of your choice on the connected PLC or laptop.

Step 3 : Enter the IP address of the PLC in the address field of your PC´s or laptop´s browser.

Example: http://192.168.5.30

Note 2: The IP address of the main controller set at delivery is specified in Table 46.

Step 4 : The WebVisu page "Overview" is displayed in the web browser of the connected PC or laptop.

✓ **The remote connection to the WebVisu of BESS has been successfully established.**

22.2 Navigation

22.2.1 Home Button

The WebVisu "Overview" page can be displayed by selecting the "Home" button that appears on the left side of each WebVisu page *(see figure below)*.

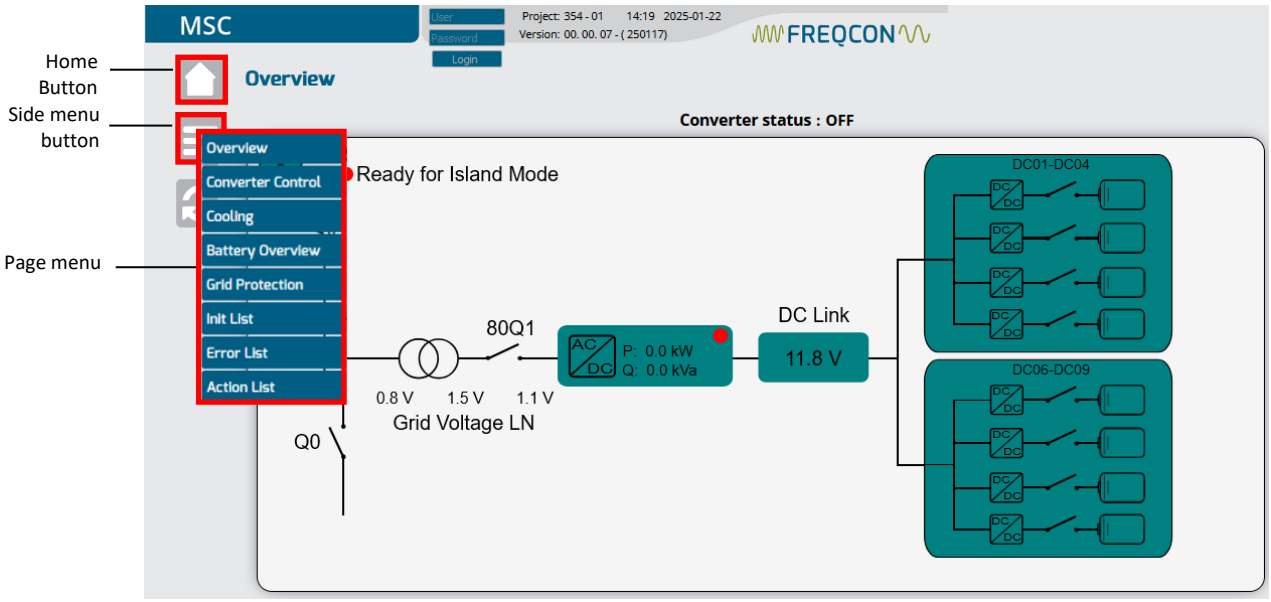

Figure 83: Navigation

22.2.2 Page Menu Button

The Page Menu is displayed via the Page Menu button that appears on every WebVisu page (*see figure 83*).

After selecting the Page Menu button, the Page Menu appears, where all WebVisu pages that can be selected with the respective user profile.

22.3 WebVisu User Interface

At the top of each WebVisu page, a user interface appears for each user (*see figure below*):

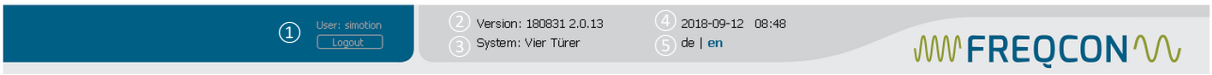

Figure 84: WebVisu user interface

The user interface provides the following information:

	Notification/Function	Description
①	User login	Type in the user profile name and password here. Press "Enter" to log in with a user profile. If a user profile is logged in, the current user profile is displayed here.
②	Version	Software version currently installed in the main control of the BESS
③	System	BESS-Identification number
④	Time/Date	Current time and date
⑤	Language selection	Choice between German and English display language

22.4 WebVisu Pages

22.4.1 Overview

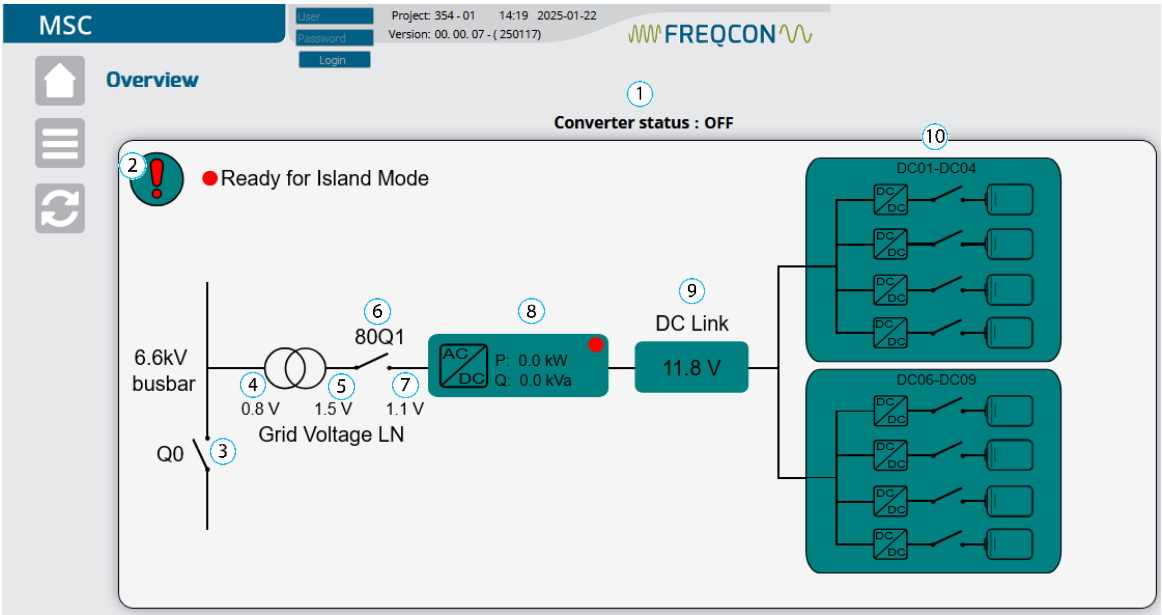

Figure 85: WebVisu page "Overview"

The "Overview" WebVisu page (*see figure above*) provides the user with a graphical overview of the main components of the BESS system and displays the following actual values:

	Description	Value
1	Converter status; for more detailed description see page “Converter control”	--
2	Green: no errors, red: errors; Clicking on the symbol takes you to the page "Error list"	--
3	MV Switch status	Open / closed
4	Voltage at the high-voltage side of the MV transformer	V
5	Voltage at the low-voltage side of the MV transformer	V
6	AC Circuit breaker 80Q1 (Switching state)	Open / closed
7	Voltage at the AC output of the converter	V
8	AC/DC Converter: active power and reactive power; Red: off, green: operation; Clicking on the symbol takes you to the page "AC-DC converter"	kW / kVA
9	DC Link voltage; Clicking on the symbol takes you to the page “DC Link”	V
10	DC/DC Converter; Clicking on the symbol takes you to the page "Overview DC-DC" of the DC Subsystems DC01-DC04 respectively DC06-DC09	--

22.4.2 Overview DC-DC

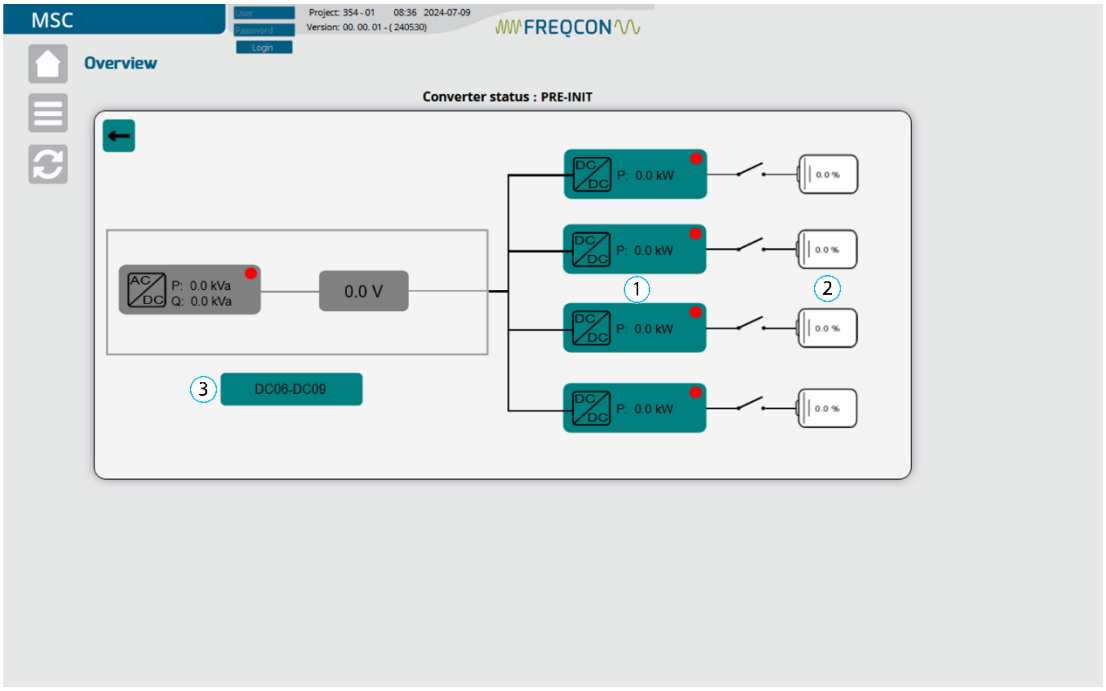

Figure 86: WebVisu page "Overview DC-DC"

The "Overview DC-DC" WebVisu page (*see figure above*) provides the user with a graphical overview of the main components of the BESS system and displays the following actual values:

	Description	Value
1	DC/DC Converter: active power (positive value: battery is charging, negative value: battery is discharging) Red: off; green: operation; Clicking on the symbol takes you to the page "DC-DC Converter" of the respective battery string	kW
2	State of charge	%
3	Switch to the page “Overview DC-DC” of the other DC Subsystem	--

22.4.3 AC-DC Converter

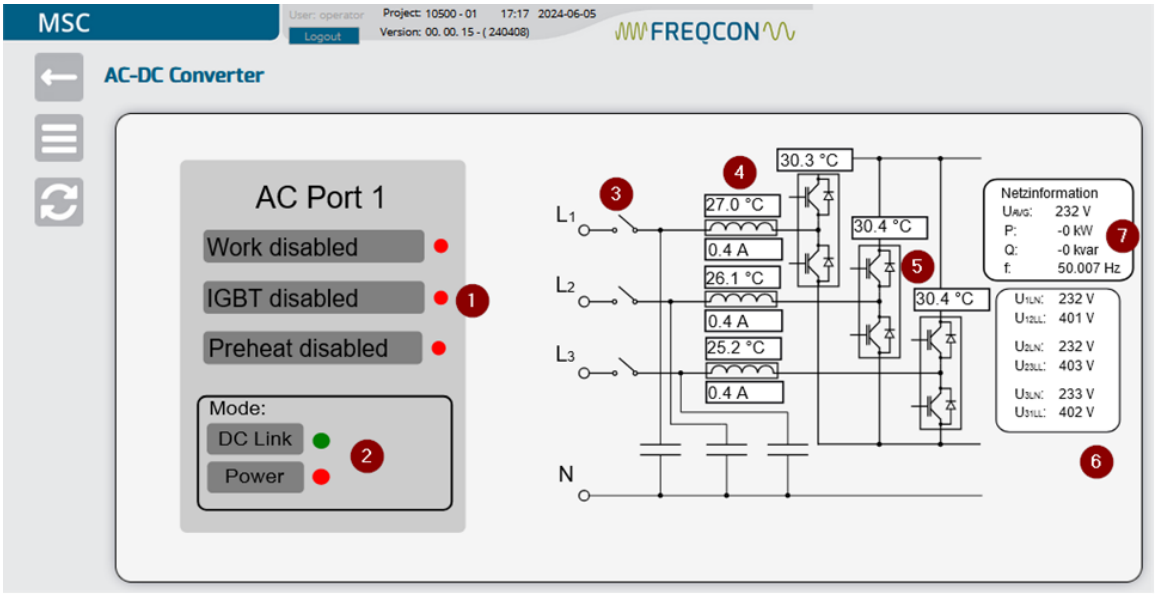

Figure 87: WebVisu page “AC-DC Converter"

	Description	Value
1	Working mode, not changeable	--
2	Control mode, not changeable	--
3	AC Circuit breaker	Open / closed
4	Inductor temperatures and phase currents through the IGBT and inductors	°C / A
5	IGBT temperatures	°C
6	String voltages and phase voltages at grid connection point	V
7	Grid information: Average voltage, active power, reactive power, grid frequency	V / kW / kvar / Hz

22.4.4 DC Link

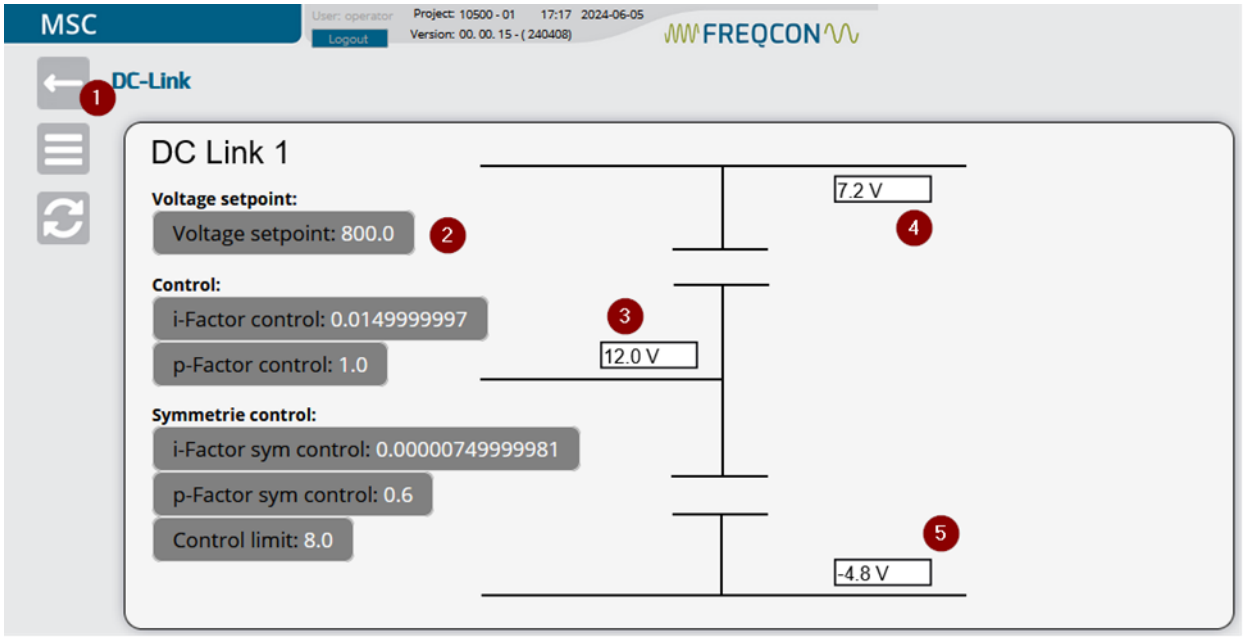

Figure 88: WebVisu page “DC Link"

	Description	Value
1	Back to “Overview”	--
2	DC link voltage setpoint, fixed value	V
3	Total DC link voltage	V
4	Positive DC link voltage	V
5	Negative DC link voltage	V

22.4.5 DC-DC Converter

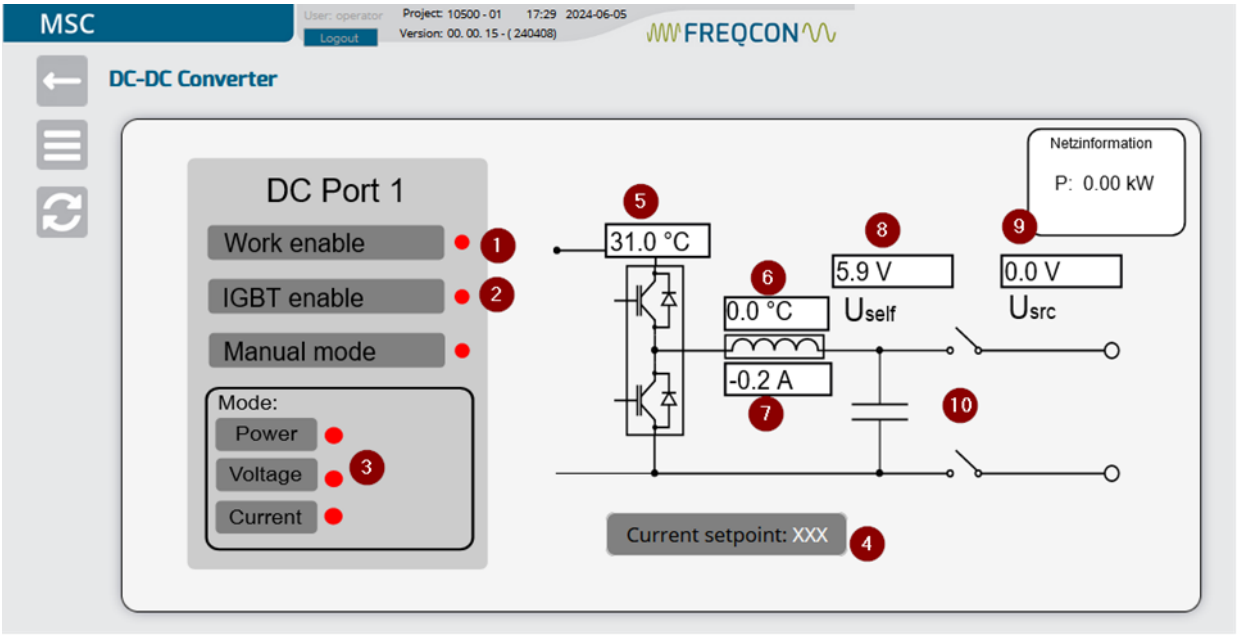

Figure 89: WebVisu page “DC-DC Converter"

	Description	Value
1	Status, not manually changeable	--
2	IGBT enabled	--
3	Control mode, not manually changeable	--
4	Manual setpoint, not available here	--
5	IGBT temperature	°C
6	Inductor temperature	°C
7	Current, filtered	A
8	Voltage at the filter capacitor	V
9	Voltage at the source	V
10	DC contactor (positive and negative)	Open / closed

22.4.6 Converter Control

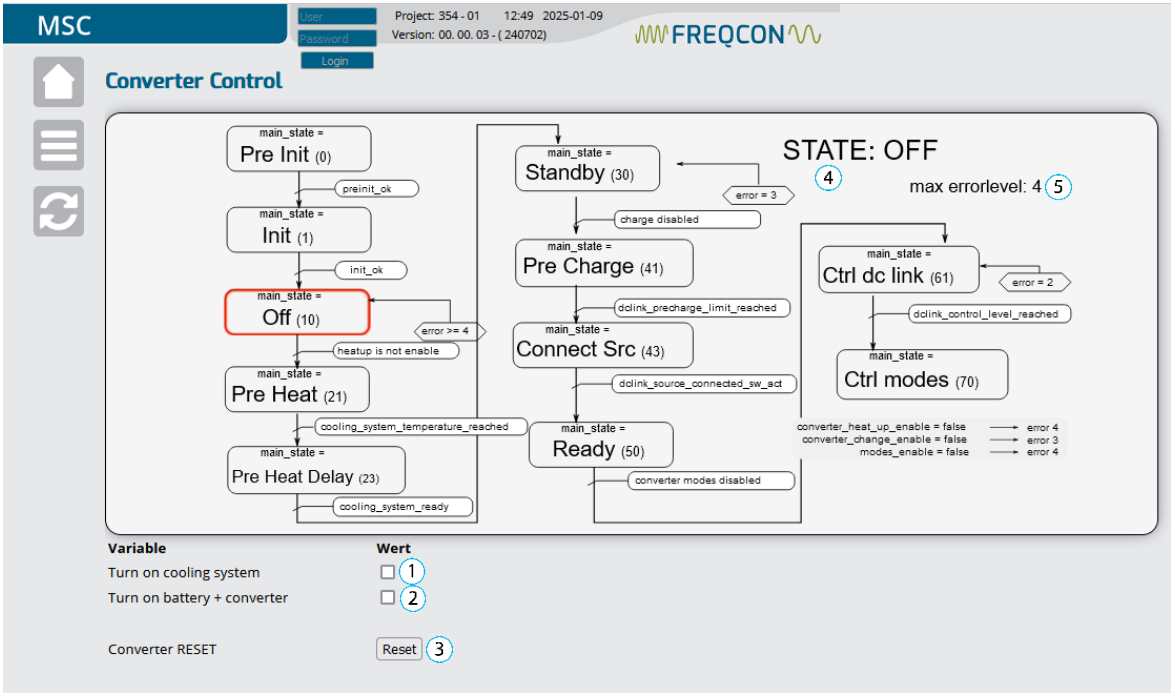

Figure 90: WebVisu page "Converter Control"

	Description	Value
1	Switch on cooling system, converter starts up to standby	--
2	Switch on converter and connect battery system	--
3	Reset converter error	--
4	The converter follows a step chain when it is switched on: Preinit: After switching on the PLC Init: Loading the initialization parameters from the memory card OFF: Converter is off Preheat: Coolant is heated to minimum temperature Preheat Delay: Temperature is held for a few minutes to reduce humidity caused by condensation on the components Standby: Cooling system is ready for use PreCharge: Charging of the DC link via resistors Connect Source: Switching on the mains switch S1 Ready: DC link is pre-charged and converter is connected to the mains, but IGBT is still off Ctrl DC Link: Switch on IGBT and regulate DC link voltage to nominal value Ctrl Modes: Normal operation	--
5	Error level 0 ... 1: Messages, warnings Error level 2: Shutdown of subsystems, e.g. a DC port Error level 3: Shutdown to standby, e.g. in the event of current or voltage overshoots, overtemperatures, etc.	--

22.4.7 Cooling

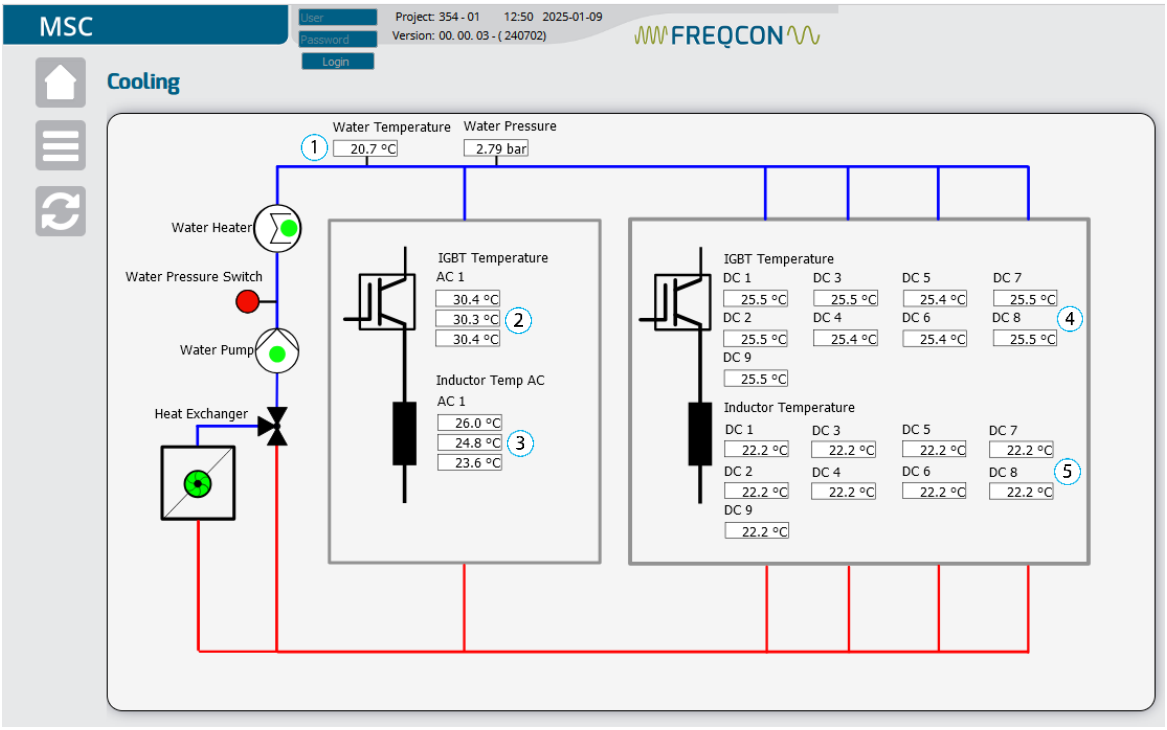

Figure 91: WebVisu page "Cooling"

The "Cooling" WebVisu pages provide the user with a graphical overview of the main components of the BESS cooling system:

- Cooling water heating element (water heater)
- Pressure switch
- Cooling water pump (water pump)
- Heat exchanger

The following actual values are displayed on the "Cooling" WebVisu page:

	Description	Value
1	Cooling water temperature inside the cooling system	°C
2	Temperatures of the AC IGBTs 1/2/3	°C
3	Temperatures of AC inductors 1/2/3	°C
4	IGBT temperatures of DC ports 1 - 8	°C
5	Inductor temperatures of DC ports 1 - 8	°C

22.4.8 Battery Overview

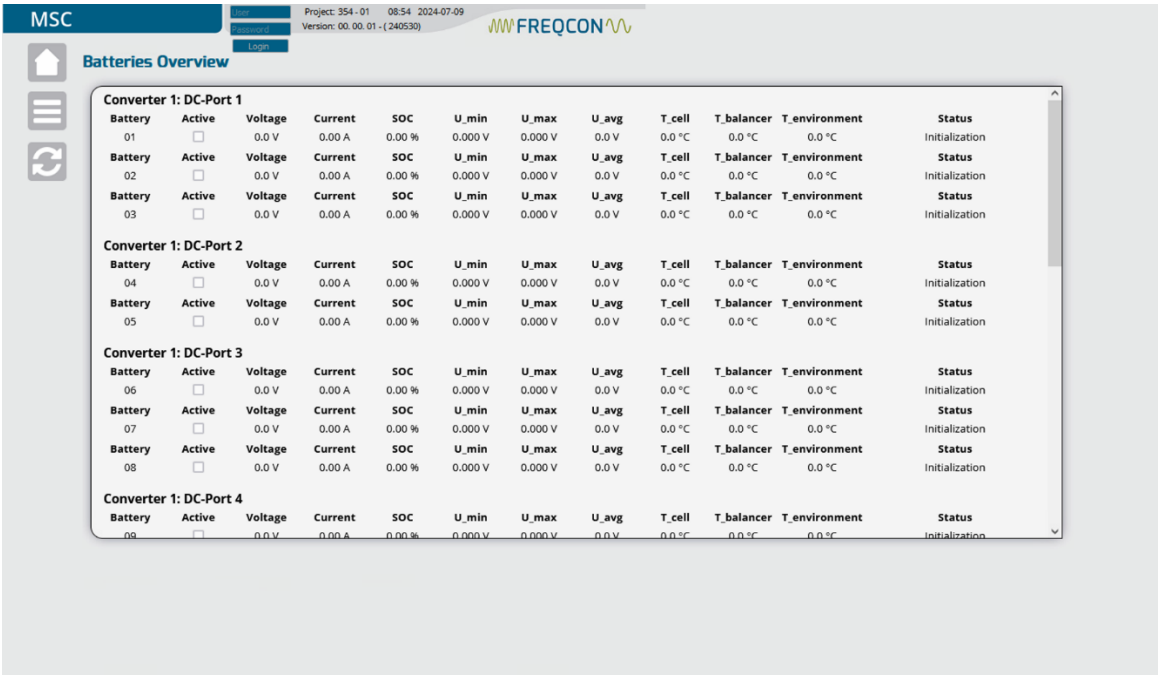

Figure 92: WebVisu page “Battery Overview"

The data is transmitted by the BMS as soon as the respective battery string is connected. If the string is disconnected from the converter system, the value "0" is displayed for current, voltage and SOC.

22.4.9 Grid Protection Settings

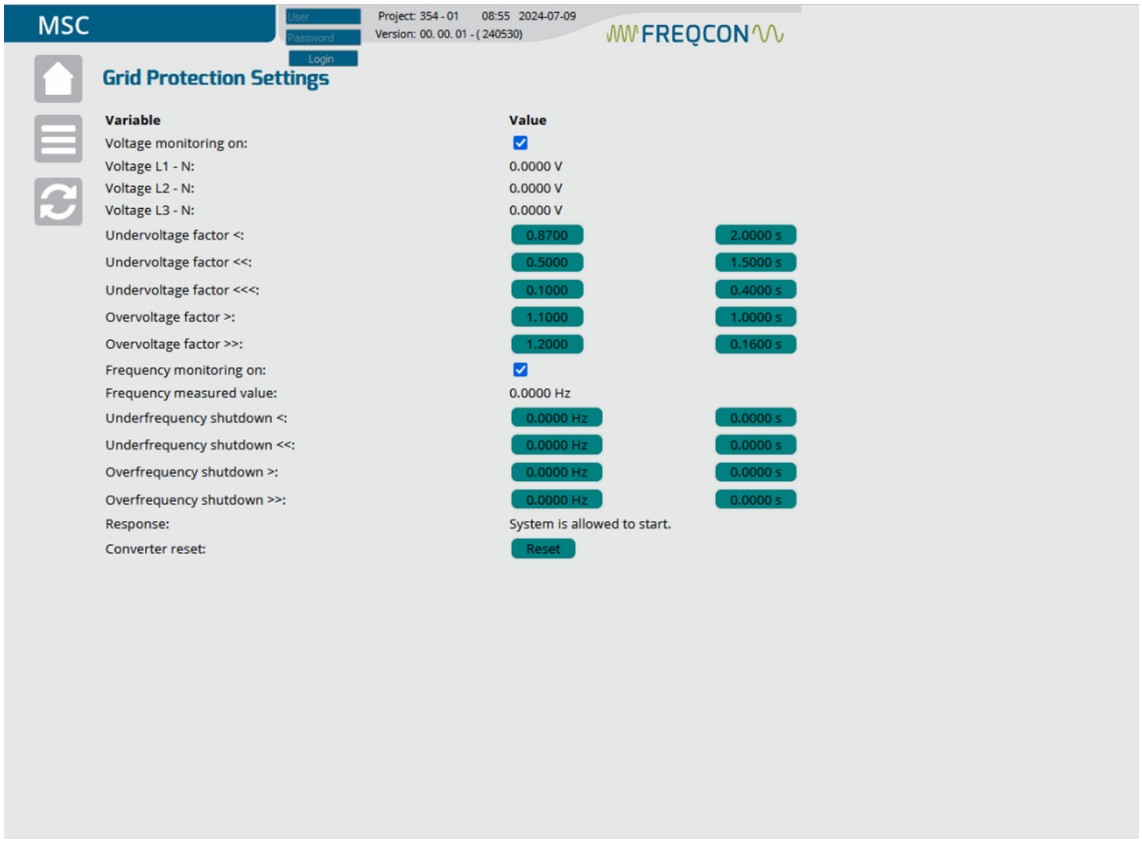

Figure 93: WebVisu page "Grid Protection Settings"

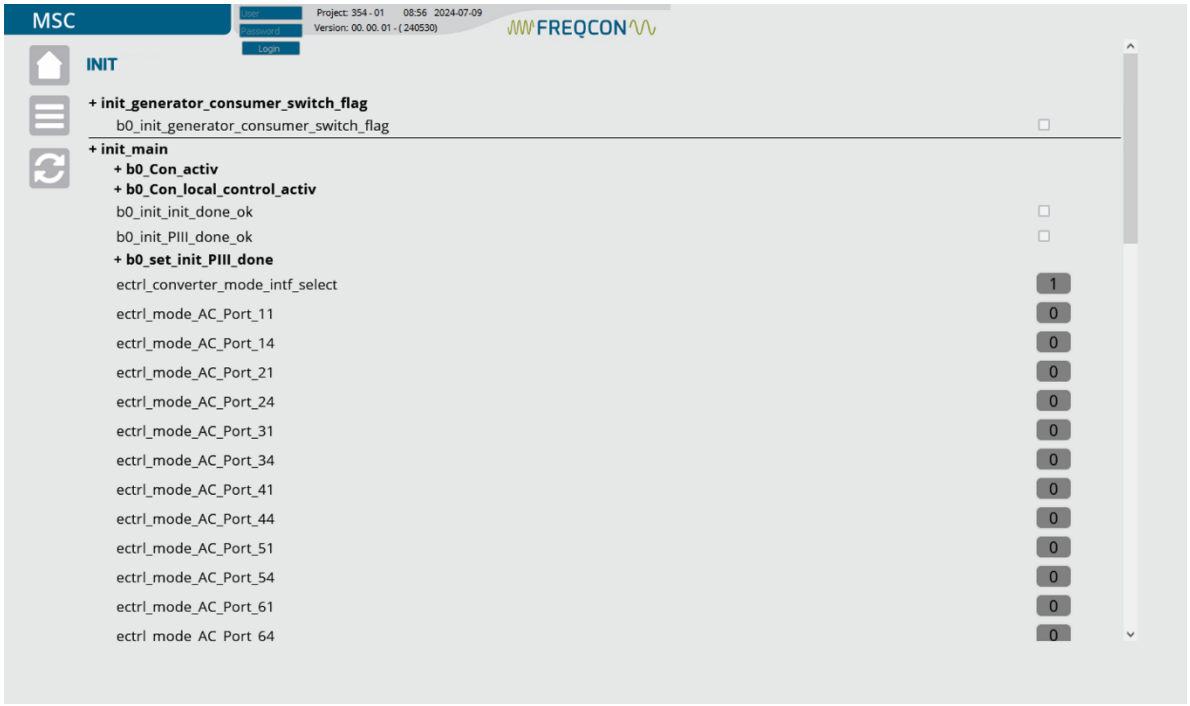
Changing the settings requires a logged in user "operator".

22.4.10 Init List



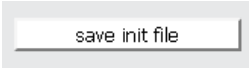


Figure 94: WebVisu page "Init List"

The WebVisu page "Init List" provides the user with an overview of all initialization values (Init values) stored in the BESS main controller.

The "Operator" user profile, as well as users who are not logged in with a profile, can only **check** the set Init values.
Only the **"Service"** and **"Factory"** user profiles can **adjust init values by** changing the value of the corresponding variable in the value field.

- ➜ To expand the parameter overview, click on the "+" sign in front of the corresponding init value.
- ➜ Fixed Init values are displayed on the right side of the corresponding Init parameter.
- ➜ To change the value, change the value inside the box and press „Enter“ on the keyboard of your PC or Laptop.
- ➜ The new value is set, but will be reset after a reboot of the controller.

Note:
To **permanently** adjust the init value, press "Enter" on your PC or laptop keyboard and then select the "Save init file" button at the bottom of the "Init" page. The selected value now remains saved even if the controller is restarted

22.4.11 Error List

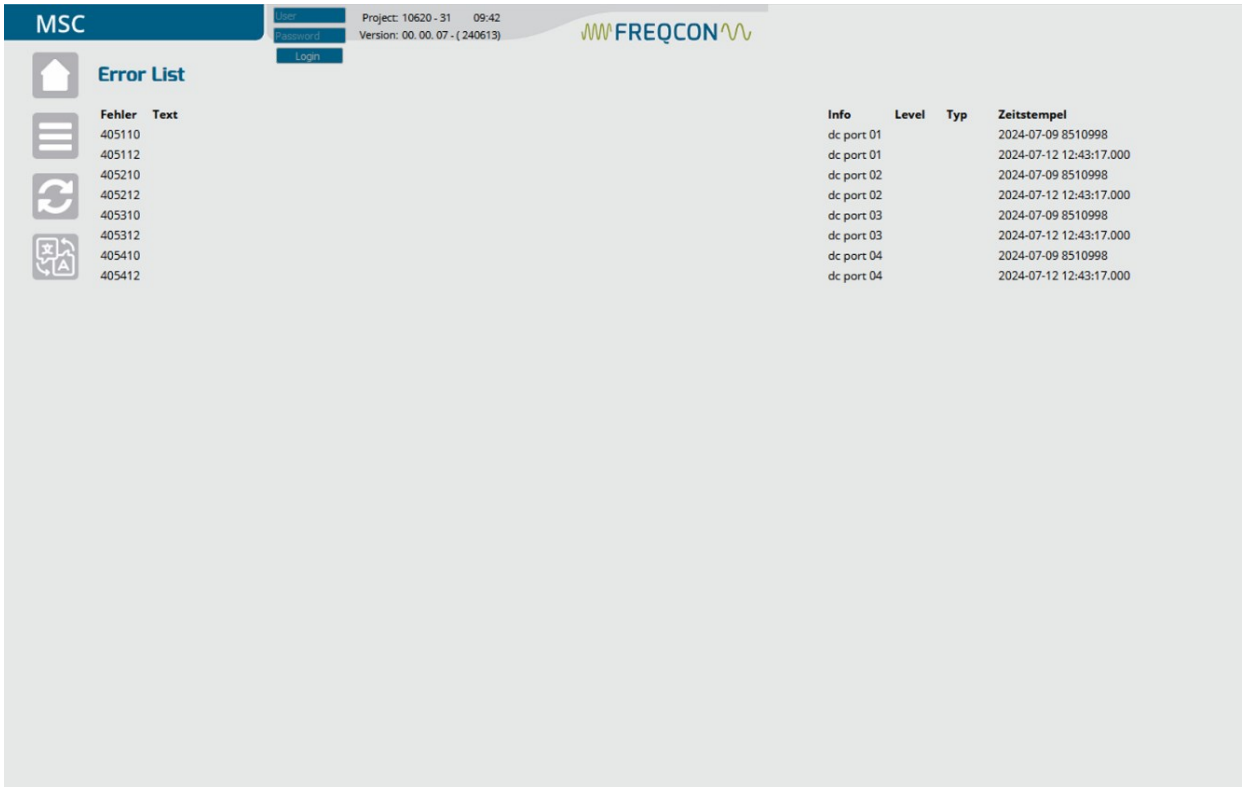

Figure 95: WebVisu page "Error list"

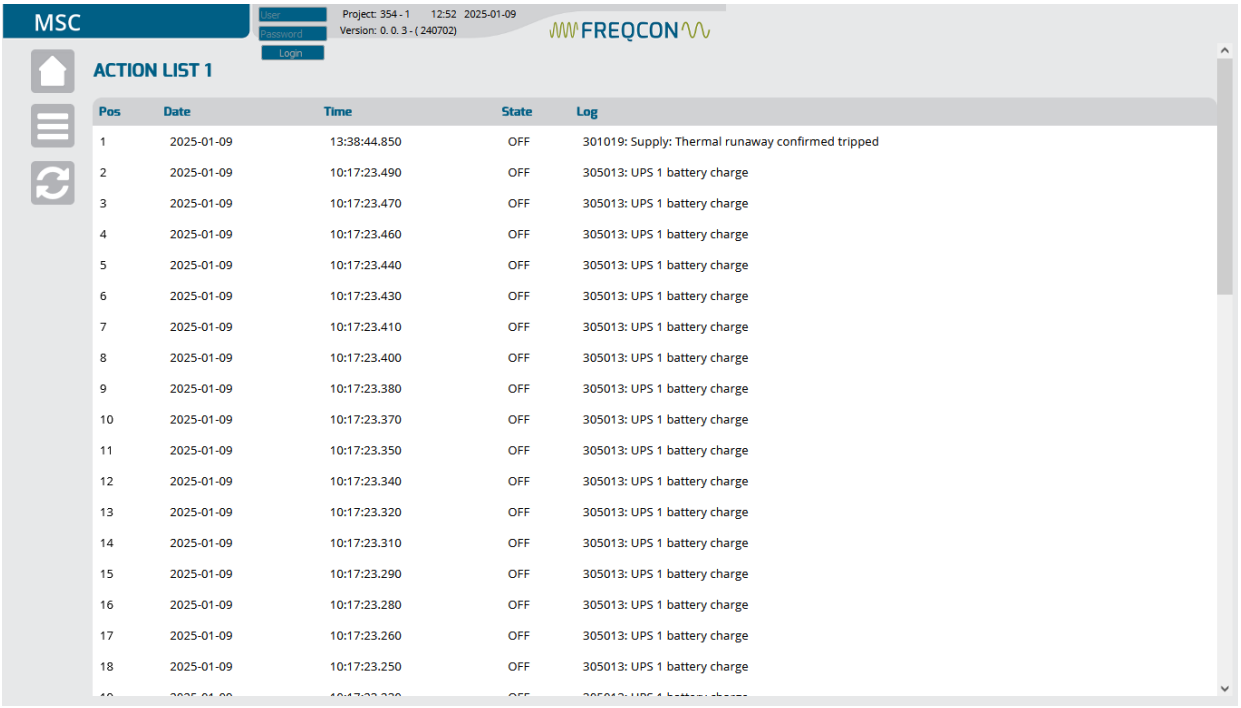


The WebVisu "Error List" page provides the user with a list of current system messages, warnings and errors.

The Error List shows only **current** system messages, warnings and errors. After a reset of a warning or error, these warning and error messages will not be any more displayed in the error list, if the warning or error is not anymore apparent.

The following information are provided inside the error list.

Name	Description
Error	Code of the individual message, warning or error.
Text	Description text for the individual message, warning or error.
Info	Additional information regarding the individual message, warning or error.
Level	Level of message, warning or error. **Note:** Level 1 to 4 are error levels and lead to a stop of the BESS system. For additional information regarding individual error messages, *see section 7.1* "Error Levels": Levels 0 and below are reporting and warning levels and do not cause the BESS system to stop.
Type	Indicates the message type of the individual message. Possible message types are: message, warning or error.
Time stamp	Indicates the time, at when the message, warning or error was detected by the controller.

22.4.12 Action List

Pos	Date	Time	State	Log
1	2025-01-09	13:38:44.850	OFF	301019: Supply: Thermal runaway confirmed tripped
2	2025-01-09	10:17:23.490	OFF	305013: UPS 1 battery charge
3	2025-01-09	10:17:23.470	OFF	305013: UPS 1 battery charge
4	2025-01-09	10:17:23.460	OFF	305013: UPS 1 battery charge
5	2025-01-09	10:17:23.440	OFF	305013: UPS 1 battery charge
6	2025-01-09	10:17:23.430	OFF	305013: UPS 1 battery charge
7	2025-01-09	10:17:23.410	OFF	305013: UPS 1 battery charge
8	2025-01-09	10:17:23.400	OFF	305013: UPS 1 battery charge
9	2025-01-09	10:17:23.380	OFF	305013: UPS 1 battery charge
10	2025-01-09	10:17:23.370	OFF	305013: UPS 1 battery charge
11	2025-01-09	10:17:23.350	OFF	305013: UPS 1 battery charge
12	2025-01-09	10:17:23.340	OFF	305013: UPS 1 battery charge
13	2025-01-09	10:17:23.320	OFF	305013: UPS 1 battery charge
14	2025-01-09	10:17:23.310	OFF	305013: UPS 1 battery charge
15	2025-01-09	10:17:23.290	OFF	305013: UPS 1 battery charge
16	2025-01-09	10:17:23.280	OFF	305013: UPS 1 battery charge
17	2025-01-09	10:17:23.260	OFF	305013: UPS 1 battery charge
18	2025-01-09	10:17:23.250	OFF	305013: UPS 1 battery charge

Figure 96: WebVisu page "Action list"

The WebVisu page "Action list" provides the user with an overview of the system events stored by the BESS controller.

The event list records the most important events and information of the BESS system, such as

- Plant operation
- Error messages
- Event messages
- Status messages

23 Troubleshooting

⚠ DANGER	
	**Electric shock due to low voltage** Severe irreparable damage to the nervous system, severe burns and death. ➜ In the event of faults, contact customer support. ➜ Have work on the energy storage device performed by service personnel only.

24 Dismantling and Disposal

24.1 Safety

For all work on the BESS observe the „Safety Instructions“ in section 2.

24.2 Dismantling

The end user is responsible for dismantling the energy storage device.

24.3 Disposal of Packaging Material

The proper disposal of packing materials is subject to national regulations and laws. If there are any doubts regarding the proper disposal of the packaging materials, ask a local disposal specialist or consult the local authorities.

The packaging my consist of the following materials:

- wooden frames
- pallets
- polyethylene foil
- plywood
- plastics
- silica gel

24.4 BESS Disposal

Always adhere the national regulations and laws regarding disposal or recycling.

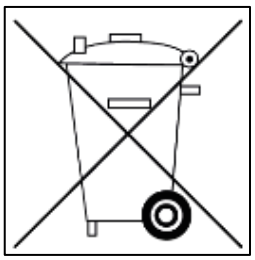
⚠ WARNING	
	**Danger to life due to improper dismantling** In the case of improper dismantling, materials can slip, tip or shift, which can result in death, severe personal injury or material damage. ➜ Only qualified personal is allowed to dismantle and dispose, wearing suitable protective clothing. ➜ Before starting to dismantle, deenergize and ground the device. ➜ Also refer to section 10.1 "Unpacking" and section 10.2 “Transport”.

⚠ WARNING	
	Do not dispose the refrigerant of the external cooling unit in the atmosphere. It should be disposed of by companies dealing with special waste collection and recovery.

The batteries installed in the FREQCON BESS Container are subject to EU Directive 2006/66/EC on batteries and accumulators as well as spent batteries and accumulators.
They must be disposed of separately.
For this purpose, the batteries categorized as industrial batteries are not to be returned to the common take-back system but directly to the manufacturer FREQCON GmbH or a third-party company, qualified for this service.

Please note that the existing regulations for the transport of hazardous materials must be observed. The transport is the responsibility of the end user.

The end user is responsible for the following when disposing of batteries:



- Packaging
- Labeling
- Return transport to the manufacturer

After transport, the battery storage system must be disposed according to local regulations.
The energy storage device also contains electrical and electronic components that must be disposed of separately from other waste in accordance with local regulations and laws.

Pay particular care for the disposal or recycling of the following components:

- Batteries
- Circuit boards
- Electrical components
- Refrigerants

NOTE:
The transport of the battery modules installed inside the battery storage system underly strict regulations (UN 3480) and are only allowed to be transported by companies, qualified for this purpose.

The energy storage device also contains electrical and electronic components that must be disposed of separately from other waste in accordance with local regulations and laws.

1 Introduction

1.1 About this Document

This document is part of project phase “Detailed Design Engineering” for the Base Load Power Hub (BLPH) Project (K559-2254). In case of any contradiction resulting by the information or specification given in this document, phase 2 or later documents supersede the information provided in this document.

1.2 Display Elements

Symbol	Meaning
➜	Action with one or several steps for which the sequence is irrelevant.
Step 1 : **Step 2 :**	Action with several steps for which the sequence is relevant.
•	First level of list.
-	Second level of list.

Table 1: Display Elements

1.3 Other Applicable Documents

The following documents are applicable:

Document type	Document Name
Archive with PCS and BESS main components data sheets	Data Sheets PCS & BESS.zip

Table 2: Other applicable documents

1.4 Generic Terms and Abbreviations Used

This following list should help you understand some of the abbreviations used in this document.

Generic Term and Abbreviation	Description
BESS	Battery Energy Storage System
BLPH	Base Load Power Hub
PCS	Power Conversion System

Table 3: Generic terms and abbreviations used

2 General

The data sheets of the main system components are attached to this document (*see section 1.3 "Other Applicable Documents"*).

File name: Data Sheets PCS & BESS.zip

Performance diagrams

Cooling with ambient air

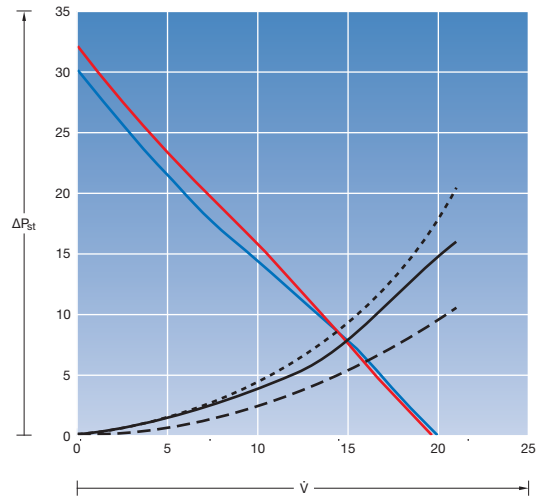
TopTherm fan-and-filter units and EMC TopTherm fan-and-filter units
Air throughput 20/25 – 900 m^3/h ..... 4 – 7
TopTherm fan-and-filter units, with EC technology
Air throughput 55 – 900 m^3/h ..... 8 – 9
Roof-mounted fans
Air throughput 500 – 1069 m^3/h ..... 10 – 12
Rack-mounted fans for 482.6 mm (19˝)
Air throughput 320/480 m^3/h 12
Tangential fans for 482.6 mm (19˝)
Air throughput 320 m^3/h 12
Selection diagram for fans 13
TopTherm air/air heat exchangers
Specific thermal output 17.5 – 90 W/K 13
Selection diagram for air/air heat exchangers 13

Cooling units

VX25 Blue e+ integration solution
Output class 1300 W
(110 – 240 V, 1 ~, 50 – 60 Hz / 380 – 480 V, 3 ~, 50 – 60 Hz) 14
Thermoelectric coolers
Total cooling output 100 W 15
TopTherm wall-mounted cooling units Blue e
Output class 300 – 2500 W (115/230 V, 1~, 400 V, 2~) ..... 15 – 18
TopTherm wall-mounted cooling units Blue e, slimline
Output category 1500 W (230 V, 1~, 400/460 V, 3~) 19
TopTherm wall-mounted cooling units Blue e
Output class 1000 – 4000 W (400/460 V, 3~) ..... 20 – 22
Wall-mounted cooling units Blue e+
Output class 1600 – 5800 W 23
TopTherm roof-mounted cooling units Blue e
Output class 500 – 2000 W (115/230 V, 1~, 400 V, 2~) ..... 25 – 27
TopTherm roof-mounted cooling units Blue e
Output class 3000 – 4000 W (400/460 V, 3~) 28
Roof-mounted cooling unit Blue e+
Output class 1300 W
(110 – 240 V, 1 ~, 50 – 60 Hz / 380 – 480 V, 3 ~, 50 – 60 Hz) 29
Modular climate control concept – Cooling module Blue e
Output class 1500 – 2500 W (230 V, 1~, 400/460 V, 3~) ..... 30 – 31

Cooling with water

Wall-mounted air/water heat exchangers
Output class 300 – 7000 W ..... 32 – 42
Roof-mounted air/water heat exchangers
Output class 1875 – 4000 W ..... 43 – 46
Liquid Cooling Package
Output class 10 kW 47
TopTherm chillers
Output class 1 – 40 kW ..... 48 – 49
Blue e+ chillers
Output class 2.5 – 5.5 kW 50



Enclosure heaters

Enclosure heaters without fan
Heating output 8 – 150 W 52
Enclosure heaters with fan
Heating output 250 – 800 W 53

TopTherm fan-and-filter units and EMC TopTherm fan-and-filter units

TopTherm fan-and-filter units – SK 3241.100

created: 10.05.2019 build on www.rittal.com/uk-en

Product description

Colour:	RAL 7035
Protection category IP to IEC 60 529:	IP 54 with standard filter and additional fine filter mat: IP 55 with standard filter and hose-proof hood: IP 56
Protection category NEMA:	with standard filter: Type 12 with standard filter and additional fine filter mat: Type 12 with standard filter and hose-proof hood: Type 3, 3R, 4, 4X
Supply includes:	Complete unit ready to install, including filter mat
Note:	With the fan-and-filter unit 3237.XXX, electrical connection is made via two single wires on the unit; for all other fan-and-filter units, a screwless spring terminal is used.

Product features

Air throughput (unimpeded air flow):	At 50 Hz: 230 m³/h At 60 Hz: 250 m³/h
Air throughput with outlet filter including standard filter mat (quantity x order number, output 50/60 Hz):	1 x 3240200: 183/205 m³/h 2 x 3240200: 203/220 m³/h 1 x 3243200: 203/230 m³/h
Rated operating voltage:	230 V, 1~, 50 Hz/60 Hz
Dimensions:	Width: 255 mm Height: 255 mm

© Rittal 2019

Required mounting cut-out:	Width: 224 mm Height: 224 mm
Build depth:	25 mm
Installation depth:	107 mm
Temperature range:	Bearing: -30°C…+70°C Operation (environment): -30°C...+55°C
Power consumption P---sub---el---subcl---:	At 50 Hz: 40 W At 60 Hz: 42 W
Rated current (max.):	At 50 Hz: 0.26 A At 60 Hz: 0.24 A
Miniature circuit-breaker/fuse:	4 A
Noise level:	At 50 Hz: 54 dB(A) At 60 Hz: 56 dB(A)
Diagonal fan:	Diagonal, self-starting shaded pole motor
Packs of:	1 pc(s).
Weight/pack:	2.24 kg
EAN:	4028177651982
Customs tariff number:	84145915
ETIM 6.0:	EC000320
ETIM 5.0:	EC000320
eCl@ss 8.0/8.1:	27180716
eCl@ss 7.0/7.1:	27180716
eCl@ss 6.0/6.1:	27180716
eCl@ss 5.1/5.1.4:	27180705
Product description:	SK fan and filter units TopTherm, 230/250 m³/h, 230 V, 1~, 50/60 Hz, WHD: 255 x 255 x 25 mm

Performance diagrams

Cooling with ambient air

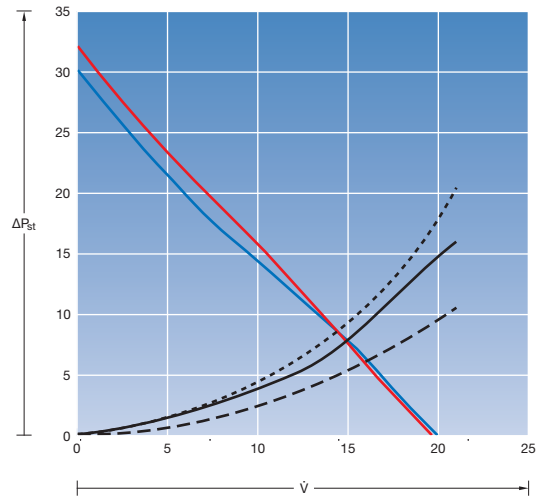
TopTherm fan-and-filter units and EMC TopTherm fan-and-filter units
Air throughput 20/25 – 900 m^3/h ..... 4 – 7
TopTherm fan-and-filter units, with EC technology
Air throughput 55 – 900 m^3/h ..... 8 – 9
Roof-mounted fans
Air throughput 500 – 1069 m^3/h ..... 10 – 12
Rack-mounted fans for 482.6 mm (19˝)
Air throughput 320/480 m^3/h 12
Tangential fans for 482.6 mm (19˝)
Air throughput 320 m^3/h 12
Selection diagram for fans 13
TopTherm air/air heat exchangers
Specific thermal output 17.5 – 90 W/K 13
Selection diagram for air/air heat exchangers 13

Cooling units

VX25 Blue e+ integration solution
Output class 1300 W
(110 – 240 V, 1 ~, 50 – 60 Hz / 380 – 480 V, 3 ~, 50 – 60 Hz) 14
Thermoelectric coolers
Total cooling output 100 W 15
TopTherm wall-mounted cooling units Blue e
Output class 300 – 2500 W (115/230 V, 1~, 400 V, 2~) ..... 15 – 18
TopTherm wall-mounted cooling units Blue e, slimline
Output category 1500 W (230 V, 1~, 400/460 V, 3~) 19
TopTherm wall-mounted cooling units Blue e
Output class 1000 – 4000 W (400/460 V, 3~) ..... 20 – 22
Wall-mounted cooling units Blue e+
Output class 1600 – 5800 W 23
TopTherm roof-mounted cooling units Blue e
Output class 500 – 2000 W (115/230 V, 1~, 400 V, 2~) ..... 25 – 27
TopTherm roof-mounted cooling units Blue e
Output class 3000 – 4000 W (400/460 V, 3~) 28
Roof-mounted cooling unit Blue e+
Output class 1300 W
(110 – 240 V, 1 ~, 50 – 60 Hz / 380 – 480 V, 3 ~, 50 – 60 Hz) 29
Modular climate control concept – Cooling module Blue e
Output class 1500 – 2500 W (230 V, 1~, 400/460 V, 3~) ..... 30 – 31

Cooling with water

Wall-mounted air/water heat exchangers
Output class 300 – 7000 W ..... 32 – 42
Roof-mounted air/water heat exchangers
Output class 1875 – 4000 W ..... 43 – 46
Liquid Cooling Package
Output class 10 kW 47
TopTherm chillers
Output class 1 – 40 kW ..... 48 – 49
Blue e+ chillers
Output class 2.5 – 5.5 kW 50



Enclosure heaters

Enclosure heaters without fan
Heating output 8 – 150 W 52
Enclosure heaters with fan
Heating output 250 – 800 W 53

FRIEDHELM LOH GROUP

Enclosure heater with fan – SK 3105.400

created: 03.06.2019 build on www.rittal.com/uk-en

Product description

Supply includes:	PTC heater with fan Quick-connection terminal Assembly parts
Note:	For precise temperature control inside the enclosure, we recommend the enclosure internal thermostat or the digital enclosure internal temperature display and thermostat. In order to prevent condensation on assemblies, a hygrostat is recommended to regulate heating. In larger enclosures, even heat distribution is best achieved by installing several low-output heaters. The installation of heaters is generally advisable, in order to prevent condensation.

Product features

Continuous thermal output at 10 °C:	800 W - 870 W Note: Continuous thermal output with fan
Rated operating voltage:	230 V, 1~, 50 Hz/60 Hz
Dimensions:	Width: 103 mm Height: 200 mm Depth: 103 mm
Miniature circuit-breaker/fuse:	6 A
Fans pre-integrated:	yes
Packs of:	1 pc(s).
Weight/pack:	1.22 kg

PROFINET IRT IGBT Interface

Part No. 504890

Version 2.6 v4

Application

The FREQCON PROFINET IRT IGBT Interface (PIII) introduces the smartest way to control IGBT modules used in MW frequency converters for battery or solar applications. The PIII interface is able to control high power IGBTs directly via a standard industrial PLC.

For additional information, see circuit diagram and parts list of PROFINET IRT IGBT Interface PIII.

Communication

The PIII can communicate with the PROFINET IRT+ protocol, DDP (dynamic data packaging) allowing data trans-mission with a cycle time of 250 µs and down to 32.5 µs. One PIII device is able to control up to seven IGBT modules (seventh IGBT as break chopper).

Interface

The PIII housing is equipped with eight 25 Pin DSUB connectors (7x IGBT, 1x HVIO) on the bottom side of the housing.

Housing

The FREQCON PIII module is housed in a 420 mm x 240 mm x 56 mm aluminum case.

Technical Data

Technical Data PIII 2.6 v4	
Input Voltage	24 V DC (±10%)
Operation current (without IGBT connected)	300 mA
Max. current	6 A
Operating temperature range	0 °C … +50 °C
Storage and transport temperature range	-30 °C … +50 °C
IGBT Interfaces	8 x 25-pole DSUB female
Protection class	IP50
Weight	3 kg
Dimensions (W x H x D)	500 x 240 x 65 mm

PROFINET Input Connector (P1 IN)

Connector M12, 4-pos., female, D-coded, for rear mounting, with Ethernet cable AWG 26 stranded Phoenix Contact Type: VS-DSIV-M12FSD/0.5-RJ45.

Pin No.	Signal	Description
1	TD+	Transmission data +
2	TD-	Transmission data -
3	RD+	Receiver data +
4	RD-	Receiver data -

PROFINET Output Connector (P2 OUT)

Connector M12, 4-pos., female, D-coded, for rear mounting, with Ethernet cable AWG 26 stranded Phoenix Contact Type: VS-DSIV-M12FSD/0.5-RJ45.

Pin No.	Signal	Description
1	TD+	Transmission data +
2	TD-	Transmission data -
3	RD+	Receiver data +
4	RD-	Receiver data -

Power Supply 24VDC Connector

Connector M12, 4-pole, female, A-coded.
Phoenix Contact Type: SACC-ES-MS-4CON-M16/0.5 SCO.

Pin No.	Description
1	+24 V
2	PE
3	GND
4	Not connected

Arc Detection Connector

Connector M12, 5-pole, female, A-coded.
CONEC Type: SAL-12-FKH5-0,5-9

Pin No.	Description
1	GND
2	5 V
3	Input arc detect signal
4	Shield
5	Not connected

LED Indication Lights

Label	Description
UDC max	DC Link Voltage too high
Imod max	Current of one or more IGBT´s too high
Error IGBT 1	Error detected on IGBT 1
Error IGBT 2	Error detected on IGBT 2
Error IGBT 3	Error detected on IGBT 3
Error IGBT 4	Error detected on IGBT 4
Error IGBT 5	Error detected on IGBT 5
Error IGBT 6	Error detected on IGBT 6
Error IGBT 7	Error detected on IGBT 7 (chopper)
PWM Mode	IGBT 1 to 3 in PWM Mode
Enable	IGBT 1 to 6 ready for operation
Top 1	Top 1 activated
Bot 1	Bot 1 activated
Top 2	Top 2 activated
Bot 2	Bot 2 activated
Top 3	Top 3 activated
Bot 3	Bot 3 activated
Top 4	Top 4 activated
Bot 4	Bot 4 activated
Top 5	Top 5 activated
Bot 5	Bot 5 activated
Top 6	Top 6 activated
Bot 6	Bot 6 activated
Chopper active	Chopper is active
Blinki	Profinet communication between PLC and PIII is established
24 V Supply	24 V input supply is connected
UL 1	L1 voltage is present
UL 2	L2 voltage is present
UL 3	L3 voltage is present
Urec	Booster voltage on rectifier is present
UDC +	DC Link voltage is present
Arc Detection	Arc detection triggered

If an error occurs (indicated by the LED´s 1 to 7) the IGBT´s 1 to 6 are deactivated by the PIII, until a reset is performed by the simotion controller.

Dip Switch Description

Three DIP switches are located on the interface board and are accessible via protection windows on the casing (*see figure 2*). The standard DIP switch settings are described on page 15.

Dip Switch -801

Standard operating setting - do not change:

Dip Switch No.	Description
1 on	Phase L3 measurement activated
1 off	Phase L3 measurement deactivated
2 on	For factory testing only
2 off	Normal operation setting
3 on	For factory testing only
3 off	Normal operation setting
4 on	Phase L2 measurement activated
4 off	Phase L2 measurement deactivated
5 on	For factory testing only
5 off	Normal operation setting
6 on	For factory testing only
6 off	Normal operation setting
7 on	Phase L1 measurement activated
7 off	Phase L1 measurement deactivated
8 on	For factory testing only
8 off	Normal operation setting

Dip Switch -800

Standard IGBT error signal settings:

Dip Switch No.	Description
1 on	Error1 disabled
1 off	Error1 enabled
2 on	Error2 disabled
2 off	Error2 enabled
3 on	Error3 disabled
3 off	Error3 enabled
4 on	Error4 disabled
4 off	Error4 enabled
5 on	Error5 disabled
5 off	Error5 enabled
6 on	Error6 disabled
6 off	Error6 enabled
7 on	Error7 disabled
7 off	Error7 enabled
8 on	No function
8 off	No function

Standard Operating Settings

The DIP switches S-801 and S-800 are located on the interface board and are accessible by a small protection window (*see figure 5*).

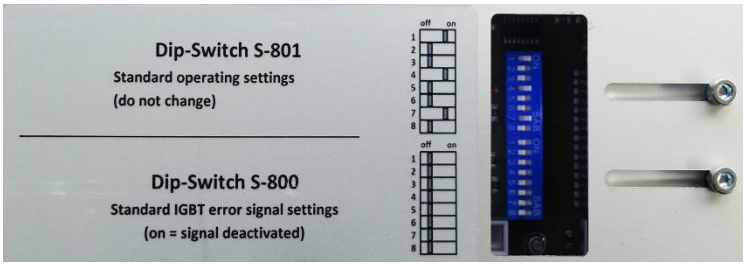

Figure 5: DIP switches in housing

In order to set the DIP switches, the screws of the protection window are to be untightened and the protection plate must be slide to the side.

After access to the S-801 and S-800 DIP switches is provided, the switches must be set as follows:

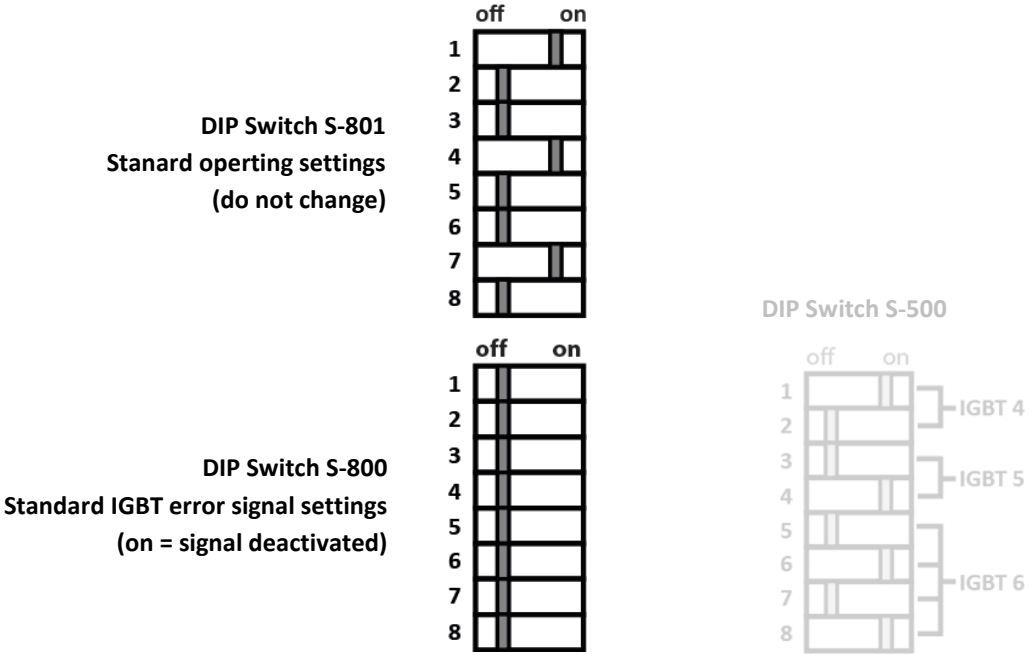

Figure 6: Depiction of dip switches S-801 and S-800

Operating Mode Settings

The DIP switch S-500 is located on the interface board to the right of the S-800 and S-801 DIP and is accessible by a small protection window. The S-500 DIP switch is used to connect the IGBTs 4, 5, 6 to different PWM signal generation sources.

In order to set the DIP switches, the screws of the protection window are to be untightened and the protection plate must be slide to the side.

After access to the S-500 DIP switch is provided, the switch must be set as follows for universal mode:

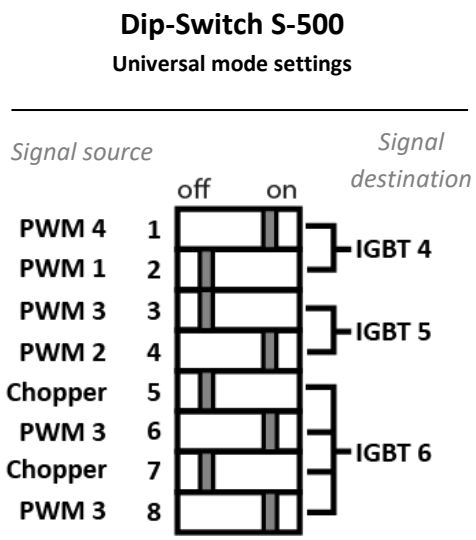

Figure 7: Depiction of DIP switch S-500

Detailed explanation of the switches:

If switch 1 is on and switch 2 off, the signal source for IGBT 4 is data word “PWM 4”,
If switch 1 is off and switch 2 is on, the signal source for IGBT 4 is data word “PWM 1”.

If switch 3 is on and switch 4 off, the signal source for IGBT 5 is data word “PWM 3”,
If switch 3 is off and switch 4 is on, the signal source for IGBT 5 is data word “PWM 2”.

If switch 5 and 7 is on and switch 5 and 8 is off, IGBT 6 is controlled by the chopper hardware logic.
If switch 7 and 7 is off and switch 5 and 8 is on, IGBT 6 is controlled by the data word “PWM 3”.

PROFINET Standard Configuration

It is possible to connect up to six PIII devices to a single main PLC. Therefore, each PIII that is connected to the main PLC must be assigned with an individual PROFINET address (see Figure 9: PROFINET address topology).

A DIP switch for PROFINET address configuration is located on the interface board and is accessible by a small protection window (*see figure 2*).

In order to set the DIP switch, the screws of the protection window are to be untightened and the protection plate must be slide to the side.

After access to the PROFINET configuration DIP switch is provided, the PROFINET configuration switches must be set as follows:

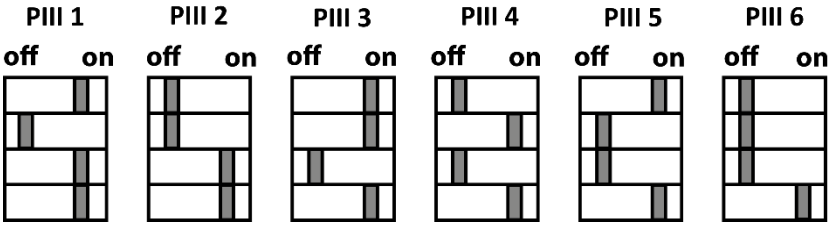

Figure 8: PROFINET address configuration

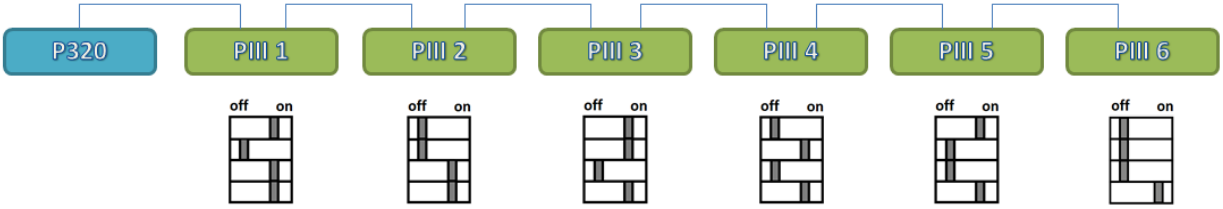

Figure 9: PROFINET address topology

Arc Detection

The FREQCON PIII is able to detect electric arcs inside its installation site. The detection is ensured by a light sensor cable (③) that can be connected to the PIII device via female M12 5-pole connector (②). The sensor (①) constantly measures the light intensity of the PIII installation environment.

Figure 10: Arc detection sensor cable

Pos.	Component
1	Light sensor socket
2	Connector 5-pole M12
3	Sensor cable 4*0.14 mm² shielded / 4.5mm outer diameter
4	Clamp-on ferrite bead

Note: The external arc detection sensor with cable is not part of the scope of supply and must be ordered separately.

The following external arc detection sensors with cable can be ordered:

Order No.	Component	Cable length
500402	External arc sensor with cable	3.5 m
500403	External arc sensor with cable	4.5 m
500404	External arc sensor with cable	5.5 m

Arc Detection Cable Installation

- ➜ Install the arc detection sensor inside the switch cabinet where the IGBT PowerStacks are installed, since potentially occurring arcs will be created in this cabinet.
- ➜ The arc detection sensor head must be installed on the front side of the cabinet frame inside the switch cabinet.
- ➜ If there is only one IGBT PowerStack installed inside the switch cabinet, install the sensor head at the height of the IGBT PowerStacks´ center.
- ➜ If more than one IGBT PowerStack is installed inside the switch cabinet, install the sensor head at the height of the center of all installed PowerStacks.
- ➜ **Do not cover the external arc detection sensor window! Covering the arc detection window leads to measurement errors of the light sensor!**

Observe the following instruction for the installation of the external arc detection sensor cable.

Task 1: **Install mounting bracket to the switch cabinet frame**

Step 1: Install the delivered mounting bracket to the frame of the switch cabinet where the power modules are located by using suitable connection material. Use the two drill holes (①) for installation to the switch cabinet frame.

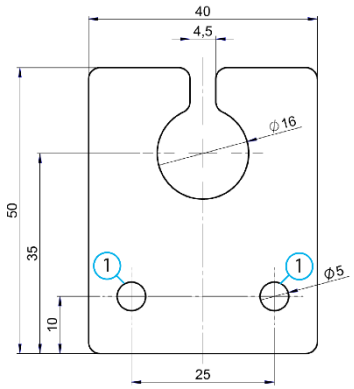

Figure 11: Mounting bracket with drill holes

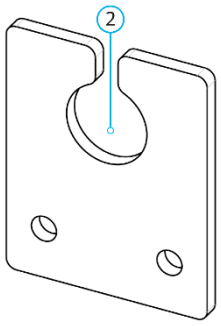

Figure 12: Mounting bracket recess

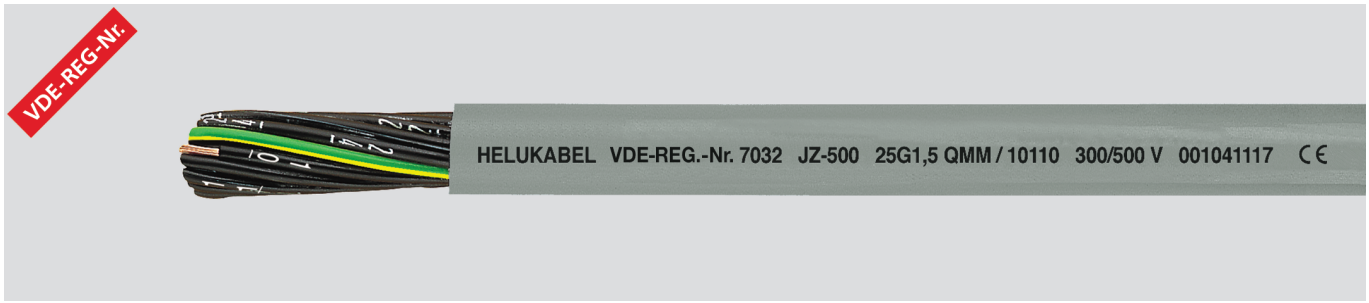
Step 2: Lead the sensor head of the delivered arc detection sensor cable through the recess of the mounting bracket (②) and finally slide it down the recess until the catches snap into place.

Step 3: Lead the other end of the arc detection sensor cable to the cabinet where the PIII converter interface is installed. Lay and fix the cable properly.

Step 4: Loop the cable once and lay the cable loop inside the delivered clamp-on ferrite bead.

Step 5: Close the clamp-on ferrite bead.



Step 6: Connect the arc detection sensor cable plug to the “ARC Detect” connector at the front side of the PIII housing.

Version Overview

Version	Date	Name	Description
1.0	2019-08-21	C. Palenzuela	First version
1.1	2022-02-04	C. Palenzuela	Updated several pages

JZ-500

flexible, number coded, meter marking

Technical data

- PVC cable adapted to DIN VDE 0285-525-2-51 / DIN EN 50525-2-51
- **Temperature range** flexing -15°C to +80°C fixed installation -40°C to +80°C
- **Nominal voltage** U_0/U 300/500 V
- **Test voltage** 4000 V
- **Breakdown voltage** min. 8000 V
- **Minimum bending radius** flexing 7,5x cable Ø fixed installation 4x cable Ø

Cable structure

- Bare copper conductor, fine wire acc. to DIN VDE 0295 cl.5 / IEC 60228 cl.5
- Core insulation of PVC compound type Z 7225
- Core identification to DIN VDE 0293 black cores with continuous white numbering
- GN-YE conductor, 3 cores and above in the outer layer
- Cores stranded in layers with optimal lay length
- Outer sheath of PVC compound type TM2 to DIN VDE 0207-363-4-1 / DIN EN 50363-4-1
- Sheath colour: grey (RAL 7001)
- With meter marking

Properties

- Extensively oil resistant, oil-/chemical resistance see "Technical Information"
- Conditional drag chain compatible
- Conditional suitability for torsion
- The materials used during manufacturing are cadmium-free, contain no silicone and are free from substances harmful to the wetting properties of lacquers

Tests

- Flame retardant acc. to DIN VDE 0482-332-1-2 / DIN EN 60332-1-2 / IEC 60332-1-2

Note

- G = with GN-YE conductor x = without GN-YE conductor (OZ)
- Please note "cleanroom qualified" when ordering.
- AWG sizes are approximate equivalent values. The actual cross section is in mm².
- Screened analogue type: **F-CY-JZ, F-CY-OZ (LiY-CY), Y-CY-JB, Y-CY-JZ**

Application

These cables are appropriate for flexible use with medium mechanical stresses, and free movement without tensile stress or forced movements in dry, moist and wet rooms but not open air. Suitable to be used as connecting and control cables in tool machines, conveyor belts, assembly lines, plant engineering, AC technology, steel production and other manufacturing environments. Selected PVC compounds guarantee good flexibility as well as an economic and fast installation.

H07V-K / (H)07V-K

PVC-Single Cores, fine wire stranded

Technical data

- PVC single cores to DIN VDE 0285-525-2-31/ DIN EN 50525-2-31 and IEC 60227-3
- **Temperature range** flexing -5°C to +70°C fixed installation -30°C to +80°C
- **Nominal voltage** U_0/U 450/750 V
- **Test voltage** 2500 V
- **Insulation resistance** min. 10 MOhm x km
- **Minimum bending radius** fixed installation core Ø ⩽ 8 mm: 4x core Ø core Ø> 8-1 2 mm: 5x core Ø core Ø> 12 mm: 6x core Ø
- **Radiation resistance** up to 80x10^6 cJ/kg (up to 80 Mrad)

Cable structure

- Bare Cu-conductor, to DIN VDE 0295 cl.5, fine wire, BS 6360 cl.5, IEC 60228 cl.5
- Core insulation of PVC compound type TI1 to DIN VDE 0207-363-3 / DIN EN 50363-3 and IEC 60227-3
- Core identification: see table below

Properties

- The materials used during manufacturing are cadmium-free, contain no silicone and are free from substances harmful to the wetting properties of lacquers

Tests

- PVC self-extinguishing and flame retardant acc. to DIN VDE 0482-332-1-2, DIN EN 60332-1-2, IEC 60332-1-2 (equivalent DIN VDE 0472 part 804 test method B)

Note

- The following colours are recommended (only single colour): black, white, blue, grey, brown, red, orange, turquoise, violet and pink. Two-coloured combinations are not allowed, with exceptions of green-yellow.
- Colours yellow, green, transparent only in (H)07V-K available.
- Two-coloured combination is only permitted for (H)07V-K.

Application

These single cores are suitable for laying in tubes, under and surface mounting of plasters and also in closed installation conduits. These are not allowed to install for direct laying on cable trays, channels or tanks. These types are permitted for the inner wiring of equipment, distributor and switchboards and also for protective laying to the lightings with a nominal voltage up to 1000 V alternating current or up to 750 V direct current against earth.

CE = Product conforms with Low-Voltage Directive 2014/35/EU.

NSGAFÖU 3 kV

Special Rubber-Insulated Cable, VDE approved, short-circuit up to 1000 V

Technical data

- Special rubber-insulated single core cables to DIN VDE 0250 part 602
- **Temperature range**
  flexing -25°C to +80°C
  fixed installation -40°C to +80°C
- Permissible conductor **operating temperature** +90°C
- **Nominal voltage**
  U_0/U 1,8/3 kV
- Max. permissible **operating voltage**
  - 3-Phase and single phase operation 2,1/3,6 kV
  - DC operation 2,7/5,4 kV
- **Test voltage**
  6 kV
- **Minimum bending radius**
  flexing 10x outer Ø
  fixed installation 6x outer Ø

Cable structure

- Tinned copper conductor, to DIN VDE 0295 cl.5, fine wire, BS 6360 cl.5, IEC 60228 cl.5
- EPR-insulation, compound type 3GI3 to DIN VDE 0207-20
- Outer casing: Polychloroprene 5GM3 acc. to DIN VDE 0207-21
- Sheath colour black or orange

Properties

Tests

- Oil resistant acc. to DIN VDE 0473-811-404/DIN EN 60811-404
- Behaviour in fire acc. to DIN VDE 0482-332-1-2 / DIN EN 60332-1-2 / IEC 60332-1-2

Note

- Considered as being short circuit safe and inherently earth-fault-proof are those operating materials and conducting assemblies where because of suitable measures and/or means applied, neither a short circuit nor a short to ground is to be expected under operating conditions which are in accordance with those specified for the intended application.
- Version in 6 kV available on request.
- AWG sizes are approximate equivalent values. The actual cross section is in mm².

Application

Particularly suitable for protection against short circuits in laying and for inherently earth-fault-proof routing in rail vehicles and omnibuses. Also suitable for laying in dry environments.

Sheath colour black

Part no.	No.cores x cross-sec. mm²	Outer Ø max. mm	Cop. weight kg / km	Weight app. kg / km	AWG-No.

JZ-602

two approval control cable, 90°C, 600 V, meter marking

Technical data

- Control cable of special-PVC acc. to UL CSA AWM I/II A/B Style 2587 and CSA
- **Temperature range**
  flexing -5°C to +90°C
  fixed installation -40°C to +90°C
- **Nominal voltage**
  UL/CSA 600 V
- **Test voltage**
  3000 V
- **Breakdown voltage**
  min. 6000 V
- **Minimum bending radius**
  flexing 7,5x cable Ø
  fixed installation 4x cable Ø

Cable structure

- Bare copper conductor, fine wire acc. to DIN VDE 0295 cl.5 / IEC 60228 cl.5
- Core insulation PVC
  UL type 90°C acc. to UL Std. 758 as well as CSA Std. C22.2 No.210
- Core identification to DIN VDE 0293 black cores with continuous white numbering
- GN-YE conductor, 3 cores and above in the outer layer
- Cores stranded in layers with optimal selected lay length
- Outer sheath PVC
  UL type 90°C acc. to UL Std. 758 as well as CSA Std. C22.2 No.210
- Sheath colour: grey (RAL 7001)
- With meter marking

Properties

- Extensively oil resistant
- The materials used during manufacturing are cadmium-free, contain no silicone and are free from substances harmful to the wetting properties of lacquers

Tests

- Flame retardant
  acc. to DIN VDE 0482-332-1-2 / DIN EN 60332-1-2 / IEC 60332-1-2 / UL VW-1 / CSA FT1

Note

- G = with GN-YE conductor
  x = without GN-YE conductor (OZ)
- Please note "cleanroom qualified" when ordering.
- AWG sizes are approximate equivalent values. The actual cross section is in mm².
- Screened analogue type:
  JZ-602-CY

Application

UL-approved and CSA certified flexible control cable rated at 600 V. Used in machine tools, control systems, connection between control panels and machines, assembly lines and other industrial equipment. Suitable for installation in dry, moist or wet environment and moderate flexing applications.
CE = Product conforms with Low-Voltage Directive 2014/35/EU.

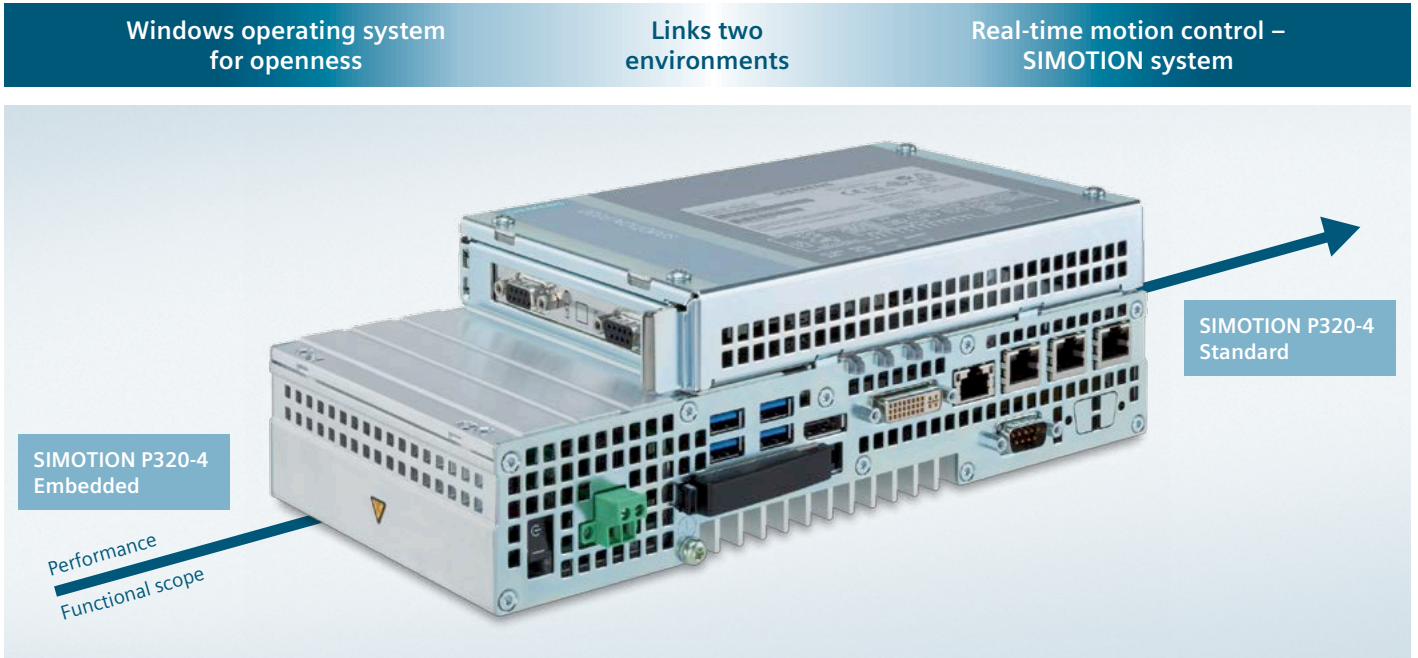
SIMOTION P320-4 PC-based Motion Control

Powerful – maintenance-free – can be flexibly configured



siemens.com/simotion

Fullest motion control functionality compact in an embedded industry PC: SIMOTION P320-4

SIMOTION P320-4 is a powerful, ultracompact and maintenance-free embedded industry PC, which has proven itself even under tough application conditions. The P320-4 combines the ruggedness of a PLC with the full motion control functionality of SIMOTION.

Your benefits

- PC-based solution for all production plants – new and retrofit projects (installation compatibility)
- High performance that can be selected to address your specific application
- Integrated motion control technology package (SIMOTION runtime)
- Integrated PC monitoring functions (watchdog, temperature, ...)
- Flexibility through individual mounting and installation options
- Simplified commissioning and troubleshooting using comprehensive test and diagnostic functions
- Operating control and monitoring functions can be simply integrated
- Visualization using scalable standard SIMATIC panels
- One engineering system for parameterizing and programming (SIMOTION SCOUT)

Can be universally used:

Packaging

Printing

Plastics

Textiles

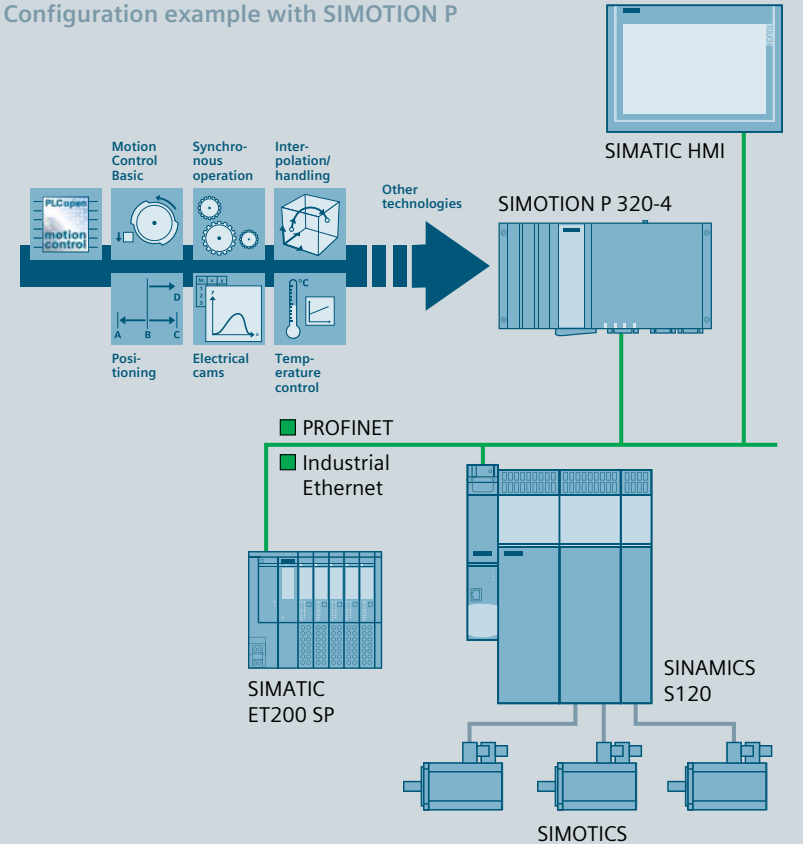
Wood

Glass

Metal forming

Renewable energy

Handling



Converting

SIMOTION P320-4 – PC-based motion control

Technical data

Mechanical design/mounting position	• Mounting rail • Wall/panel mounting • Book-type mounting, front • Mounting position: horizontal (preferred position) and vertical
Processor	• P320-4 embedded: Intel Core i3-3217UE; 2x1.6 GHz, 3M cache • P320-4 standard: Intel Core i7-3517UE; 2x1.7 GHz, 4M cache
Power supply	• 24 V DC; 19.2 ... 28.8 V DC • Isolated
Main memory	• 4 Gbyte DDR3-SDRAM
CFast	• Can be exchanged (accessible): 4 Gbyte
SSD (only P320-4 **standard** internal)	• Internal (not accessible): 80 Gbyte
CFast (only P320-4 **embedded** internal)	• Internal (not accessible): 4 - 8 Gbyte
Application conditions	• No fan
Operating system	• P320-4 Embedded: Windows Embedded Standard 7 • P320-4 Standard: Windows 7 Ultimate
Start of delivery	• SIMOTION SCOUT Version V4.4
Graphics	• Integrated Intel HD 2000 or HD 4000 • Resolution DVI: 640*480 pixels up to max. 1920*1200 pixels for 32-bit colors • Resolution display port (>1920*1200 pixels for 32-bit colors) • Graphic memory is taken from the main memory • Dual-head operation to simultaneously connect two monitors (DVI-I and display port) with two different screen contents
Power supply	• 24 V DC; 19.2 ... 28.8 V DC • Isolated
Application conditions	• No fan
PC interfaces	• 4 x USB 3.0 interfaces • 1 x COM (RS232) • 1 x Ethernet Gbit • 1 x display port (connection ext. monitor, display) • 1 x DVI
PROFINET	• PROFINET on board (3 ports)
PROFIBUS (optional)	• IsoProfibus board, pluggable

SITOP PSE200U SELECTIVITY MODULE 10A
SITOP PSE200U 10 A Selectivity module 4-channel input: 24 V DC/40 A output: 24 V DC/4x 10 A Level adjustable 3-10 A mit status message for each output

Input	
Type of the power supply network	Controlled DC voltage
Supply voltage / at DC / Rated value	24 V
Input voltage / at DC	22 ... 30 V
Overvoltage overload capability	35 V
Input current / at rated input voltage 24 V / Rated value	40 A

Output	
Voltage curve / at output	controlled DC voltage
Formula for output voltage	Vin - approx. 0.2 V
Relative overall tolerance / of the voltage / Note	In accordance with the supplying input voltage
Number of outputs	4
Output current / up to 60 °C / per output / rated value	10 A
Adjustable pick-up value current / of the current-dependent overload release	3 ... 10 A
Type of response value setting	via potentiometer
Product feature / parallel switching of outputs	No
Product feature / bridging of equipments	Yes

Type of outputs connection	Simultaneous connection of all outputs after power up of the supply voltage > 20 V, delay time of 25 ms, 100 ms or adjustable "load optimised" via DIP switch for sequential connection
Efficiency	
Efficiency in percent	99 %
Power loss [W] / at rated output current / for rated value of the output current / typical	10 W
Switch-off characteristic per output	
Switching characteristic	
• of the excess current	Iout = 1.0 ...1.5 x set value, switch-off after approx. 5 s
• of the current limitation	Iout = 1.5 x set value, switch-off after typ. 100 ms
• of the immediate switch-off	Iout > set value and Vin < 20 V, switch-off after approx. 0.5 ms
Residual current at switch-off / typical	1 mA
Design of the reset device/resetting mechanism	via sensor per output
Remote reset function	Non-electrically isolated 24 V input (signal level "high" at > 15 V)
Protection and monitoring	
Fuse protection type / at input	15 A per output (not accessible)
Display version / for normal operation	Three-color LED per output: green LED for "Output switched through"; yellow LED for "Output switched off manually"; red LED for "Output switched off due to overcurrent"
Design of the switching contact / for signaling function	Status signal output (pulse/pause signal, can be evaluated via Simatic function block)
Safety	
Galvanic isolation / between input and output at switch-off	No
Operating resource protection class	Class III
Certificate of suitability	
• CE marking	Yes
• as approval for USA	UL-Recognized (UL 2367) File E328600; cULus-Listed (UL 508, CSA C22.2 No. 107.1) File E197259
Standard / for safety	according to EN 60950-1 and EN 50178
Certificate of suitability / relating to ATEX	IECEx Ex nA IIC T4 Gc; ATEX (EX) II 3G Ex nA IIC T4 Gc; cULus Class I, Div. 2, Group ABCD, T4
Shipbuilding approval	DNV GL, ABS
Protection class IP	IP20
EMC	
Standard	
• for emitted interference	EN 55022 Class B
• for interference immunity	EN 61000-6-2
Operating data	
Ambient temperature	
• during operation	-25 ... +60 °C

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Overview

Description

Figure 1 View of devices

In conjunction with a 24 V power supply, the selectivity module is used to distribute the load current across several branches and to monitor the individual currents in these branches. Faults in the individual branches caused by overload or short-circuit are detected and selectively switched off, so that the fault does not impact the other load circuits. This means fast troubleshooting and minimized downtimes.

The key benefits of the product include:

- A maximum of 4 load branches are monitored for each module
- The response threshold can be continually set for each output using a potentiometer
- Overcurrents are reliably switched off, independent of the cable length and cable cross-section
- The 24 V supply for the other loads is maintained
- Multi-colored LED for each output for faster troubleshooting on-site
- Floating group signal contact for remote diagnostics (for -2BA00, -2BA11, -2BA21, -2BA51)
- Single-channel signal to serially indicate the state of the individual outputs (for -2BA31, -2BA41, -2BA61)

- Evaluation using free-of-charge SIMATIC S7 function blocks (S7-300/400/1200/1500) for modules with single channel signal
- It can be selected that the load branches are sequentially switched on to reduce the total inrush current
- Versions for limited output power ratings according to NEC Class 2 (maximum, 100 VA).

Ordering data

The following device options are available:

Selectivity modules	
Type	**Order number**
SITOP select 24 V DC input Number of outputs: 4 Setting range of the response threshold: 2 - 10 A with group signaling contact	6EP1961-2BA00
SITOP PSE200U 24 V DC input Number of outputs: 4 Setting range of the response threshold: 0.5 - 3 A with group signaling contact	6EP1961-2BA11
SITOP PSE200U 24 V DC input Number of outputs: 4 Setting range of the response threshold: 3 - 10 A with group signaling contact	6EP1961-2BA21
SITOP PSE200U 24 V DC input Number of outputs: 4 Setting range of the response threshold: 0.5 - 3 A with group signaling contact	6EP1961-2BA31
SITOP PSE200U 24 V DC input Number of outputs: 4 Setting range of the response threshold: 3 - 10 A with group signaling contact	6EP1961-2BA41

Selectivity modules	
Type	**Order number**
SITOP PSE200U 24 V DC input Number of outputs: 4 Setting range of the response threshold: 0.5 - 3 A with group signaling contact, NEC Class 2	6EP1961-2BA51
SITOP PSE200U 24 V DC input Number of outputs: 4 Setting range of the response threshold: 0.5 - 3 A with single-channel signal, NEC Class 2	6EP1961-2BA61

Accessories	
Type	**Order number**
Flat insertable fuse: Manufacturer, Littelfuse, series FKS, 19 mm long (for 6EP1961-2BA00)	162.6185.* (FKS-32), 166.7000.* (FKS-80)
Device name plate 20 mm × 7 mm, TI grey (for 6EP1961-2BA11, -2BA21, -2BA31, -2BA41, -2BA51, -2BA61)	3RT2900-1SB20

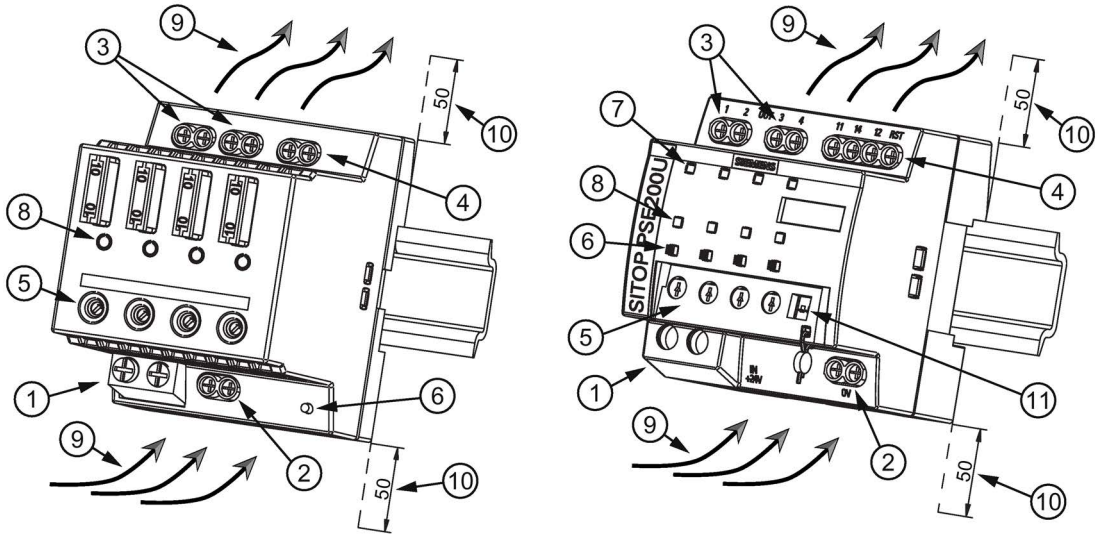
Safety notes

1

1.1 General safety instructions

⚠ WARNING
Correct handling of the devices When operating electrical devices, it is inevitable that certain components will carry dangerous voltages. Therefore, failure to handle the units properly can result in death or serious physical injury as well as extensive property damage. Only appropriately qualified personnel may work on or in the vicinity of this equipment. Perfect, safe, and reliable operation of this equipment is dependent on proper transportation, storage, installation and mounting. Before installation or maintenance work can begin, the system's main switch must be switched off and measures taken to prevent it being switched on again. If this instruction is not observed, touching live parts can result in death or serious injury.



1.2 Safety instructions for hazardous zones

⚠ WARNING
OPERATE POTENTIOMETERS OR SWITCHES IN NON-HAZARDOUS AREAS ONLY!

Description, device design, dimension drawing 2

2.1 Device description

Using the selectivity module, a 24 V DC output voltage from a regulated power supply can be distributed across four load circuits. The response threshold of the output current can be individually set for each output using a potentiometer. When the set response threshold is exceeded, the output is automatically switched off according to a defined switch off characteristic, and can be switched on again after a wait time using a pushbutton or remote reset (SITOP PSE200U). The status of the output is displayed using a multi-color LED for each output. The status of the outputs can be processed via a group signaling contact or via a serial single-channel signal.

SITOP select SITOP PSE200U

2.2 Connections and terminal designation

The input terminals ① can be used to establish the connection to the supply voltage. The 0 V connection ② is used to supply the internal electronics. Output terminals ③ are used to connect to the loads to be supplied (also see Chapter Installation (Page 43)).

Using the group signal contact or status output ④, the operating state of the device can be processed (function and contact rating, see Chapter Figure 2-4 Operating displays and signaling (SITOP select and SITOP PSE200U) (Page 15)).
The remote reset input ④ is used to reset outputs that have been automatically shut down (function, see Chapter Status displays and signaling (Page 15)).

	12 mm	8 mm	-

*1) Do not subject the end stop to higher loads

Figure 2-2 Terminal data

NOTICE

Overload of the wiring

The "0 V" connection is only used to supply the internal electronics of the selectivity module. The 0 V of the connected loads must be routed directly to the power supply using separate cables!

2.3 Potentiometer

The potentiometer ⑤ on the front of the device is used to set the response threshold of the output current. When delivered, the maximum possible response threshold is set.

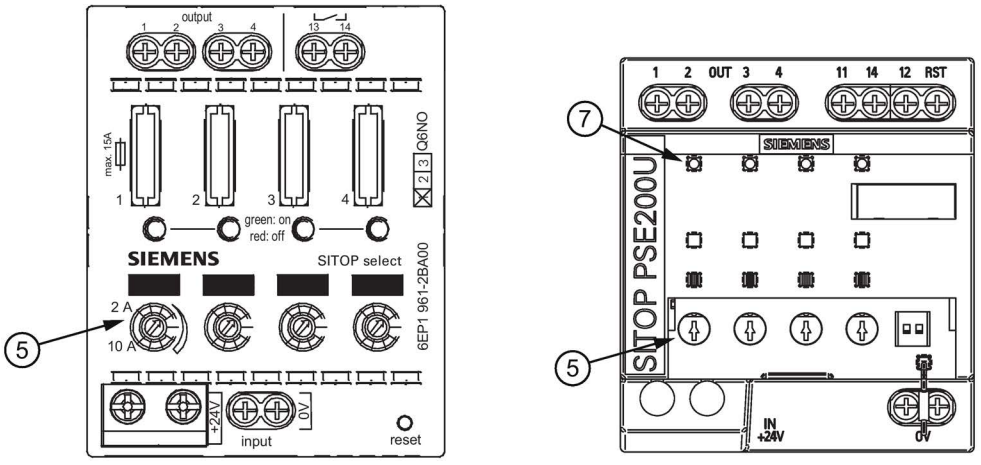

Figure 2-3 Potentiometer (SITOP select and SITOP PSE200U)

Note

It is only permissible to use an insulated screwdriver when actuating the potentiometer.

For information on actuating the potentiometer (screwdriver, torque), see Figure 2-2 Terminal data (Page 13).

Note

For SITOP PSE200U, the actual output current of a branch can be determined by measuring the voltage at measuring point "MP" ⑦ with respect to the "0 V" terminal. A measured voltage of 1 V corresponds to an output current of 1 A.

2.4 Status displays and signaling

Signaling	**6EP1961-2BA11** **6EP1961-2BA21** **6EP1961-2BA51**	**6EP1961-2BA31** **6EP1961-2BA41** **6EP1961-2BA61**
Status output	-	Serial signaling (see Figure 2-5 Status signaling (Page 18)), '1' = 24 V DC / '0' = 0 V (pull down)

1* The status of all four outputs is serially signaled using status output ④ (see Figure 2-5 Status signaling (Page 18)). A frame comprises a start bit START and four status bits Ci (i=1 … 4), which are each separated by a pause bit P. While the device powers up, or if the supply voltage is missing, nothing is signaled, the status remains continuously at '0'. For SIMATIC-S7 controllers (S7-300/400/1200/1500), a function block for evaluation is available under (http://www.siemens.com/sitop) or the direct link (https://support.industry.siemens.com/cs/us/en/view/61450284).

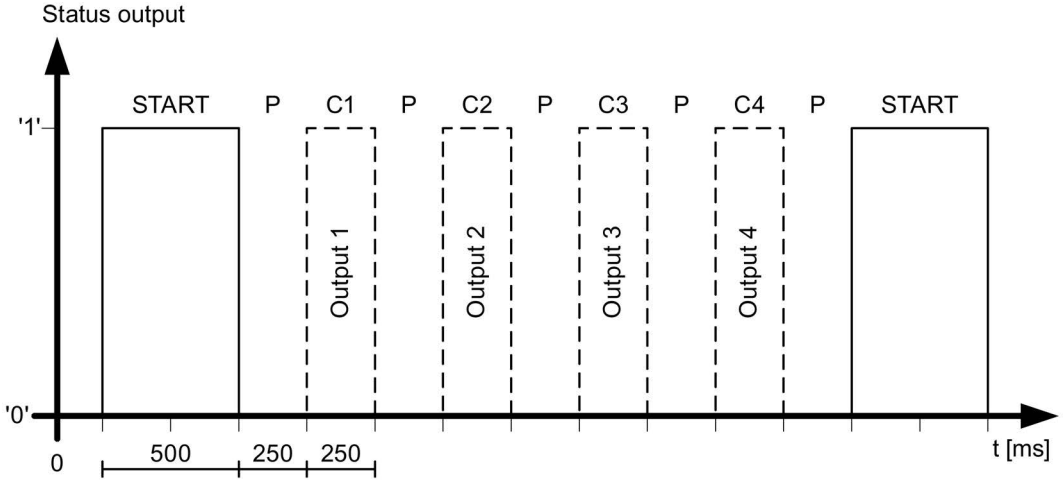

Figure 2-5 Status signaling

2.5 Buttons and selector switches

2.5.1 SITOP select

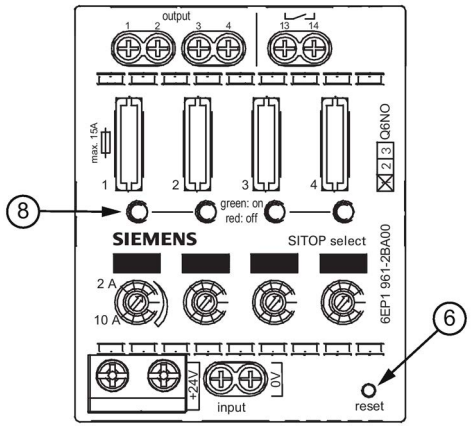

Figure 2-6 Reset button SITOP select

The reset button ⑥ for the SITOP select selectivity module has the following two functions:

1. resets all outputs automatically switched off due to an overload condition (see Chapter Electronic overload shutdown and reset (Page 21)).
2. is used to program the sequential switch-on delay (see Chapter Setting the switch-on delay time (Page 26).

Note

Switching off and switching on an output while commissioning the device

For selectivity module SITOP select, an output can be manually switched off and switched on, e.g. during commissioning, by removing and inserting the flat fuse of the corresponding output.

2.5.2 SITOP PSE200U

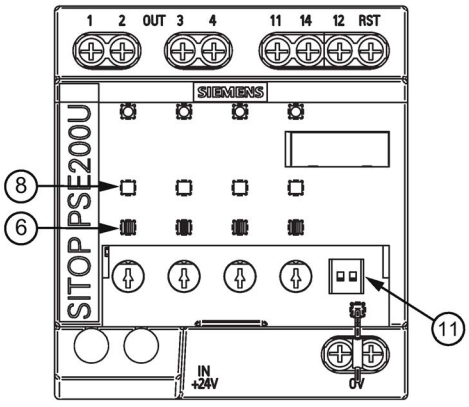

Figure 2-7 Buttons and selector switches, SITOP PSE200U

The button ⑥ for the SITOP PSE200U selectivity module has the following two functions:

1. manually switching an output off and on (see the following).
2. resetting an output automatically switched off due to an overload condition (see Chapter Electronic overload shutdown and reset (Page 21)).

The selector switch ⑪ can be used to select the delay time when switching on the individual outputs (see Chapter Setting the switch-on delay time (Page 26)).

Manually switching an output on and off

An individual output can be switched on and switched off using the button. When the device is delivered, the outputs are manually switched off.

Switching off an output:
For outputs that are switched on, LED ⑧ of the particular output is lit green. You can switch off the output by pressing the assigned button ⑥. The LED then flashes orange (output has been manually switched off).

Switching on an output:
For outputs that have been manually switched off, LED ⑧ of the particular output is lit orange. You can switch on the output by pressing the assigned button ⑥. The LED is then lit green (output is switched on).

Note

An output that has been manually switched-off can only be manually switched-on again by manually pressing the button again. It is not possible to switch on an output that has been manually switched off using the remote reset signal.

An output that has been manually switched off remains saved (latch) even when the supply voltage is no longer available, and is a manually switched off when the supply voltage returns.

2.6 Electronic overload shutdown and reset

An overload is permitted for a defined period of time for each selectivity module output. The output is electronically shut down according to the "Shutdown characteristic" diagram after the limit value has been exceeded.

2.6.1 SITOP select

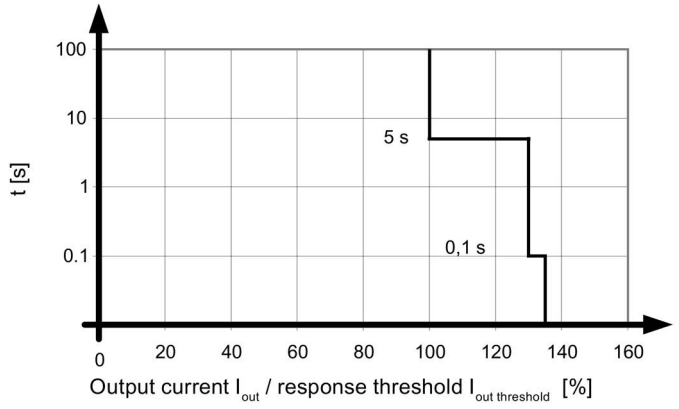

Figure 2-8 Shutdown characteristic SITOP select

- An output current is continuously permissible up to the selected current response threshold (LED of the output is lit green).
- In the range 101 - 129 % of the selected current response threshold, an overload current is permissible for 5 seconds; after this time, the output is electronically shut down (LED of the output is lit red).
- In the range > 130 % of the selected current response threshold, the current is limited to 130 %, after approx. 50 - 100 ms the output is electronically shut down (LED of the output is lit red).
- When the output current exceeds the selected current response threshold, and if the supply voltage simultaneously dips below 20 V, then the output is electronically shutdown (the LED of the output is lit red).

Reset of an electronic overload shutdown using the reset button

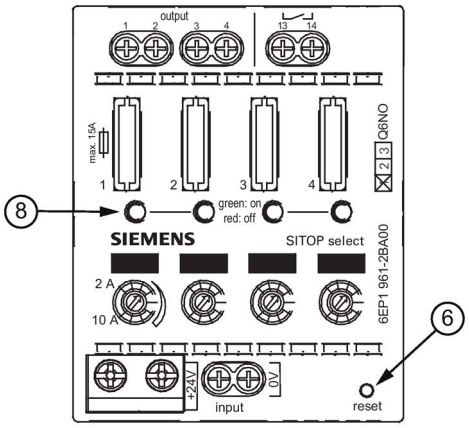

Figure 2-9 Reset button SITOP select

Using the reset button ⑥, after a delay time has elapsed, outputs that have been shut down due to an overload can be reset, i.e. the electronic shutdown can be reset.

The initial situation is an electronic shutdown of individual outputs as a result of an overload condition. This is signaled using the LED ⑧ of the particular output.

LED	Meaning/handling
Lit red	Electronic shutdown as a result of an overload; wait time until a reset is possible: approx. 20 seconds.
Flashes red	Output ready for a reset; press the button to switch-on the output again.
Lit green	The reset was carried out, the output was switched-on again.

Procedure to reset an electronic shutdown:

1. After an electronic shutdown (LED of the output is lit red), allow a wait time of 20 seconds to elapse.
2. Press the reset button ⑥
   Electronic shutdown was reset, and the output has been switched-on again (LED of the output is lit green).

Note

When pressing the button, all of the outputs shut down due to an overload, which are ready for reset (LED flashes red), are switched-in again together.

Note

If, after a reset, the cause of the overload is still present, then the output is again automatically shut down. Before carrying out a reset, remove the cause of the overload to prevent a new shutdown.

2.6.2 SITOP PSE200U

Shutdown characteristics SITOP PSE200U (with the exception of -2BA51, -2BA61) product version 1:

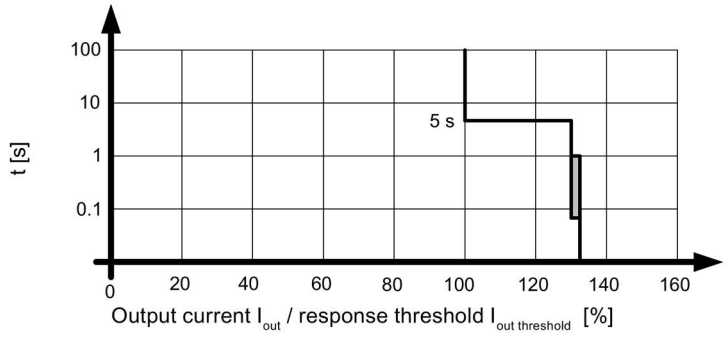

Figure 2-10 Shutdown characteristics SITOP PSE200U (product version 1)

- An output current is continuously permissible up to the selected current response threshold.
- In the range 101 - 129 % of the selected current response threshold, an overload current is permissible for 5 seconds; after this time, the output is electronically shut down.
- In the range > 130 % of the selected current response threshold, the current is limited to 130 %; typically after 100 ms the output is electronically shut down.
- When the output current exceeds the selected current response threshold, and if the supply voltage simultaneously dips below 20 V, then the output is electronically shutdown.

Shutdown characteristic SITOP PSE200U (with the exception of -2BA51, -2BA61) from product version 2 and higher:

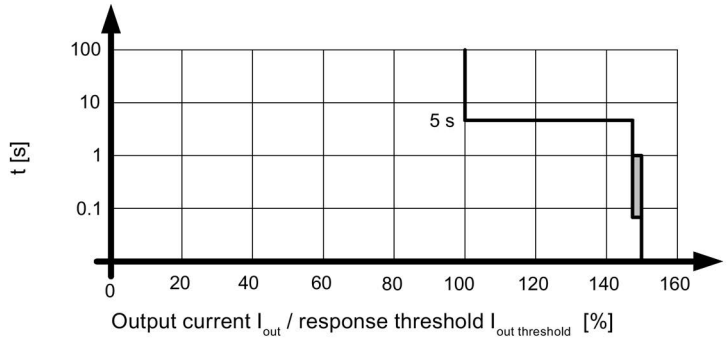

Figure 2-11 Shutdown characteristics SITOP PSE200U (from product version 2 and higher)

- An output current is continuously permissible up to the selected current response threshold (LED of the output is lit green).
- An overload current for 5 seconds is permissible in the range 101 - 149 % of the set current response threshold value (the LED of the output flashes green) - and then the output is electronically shut down (LED of the output is red).

- In the range > 150 % of the selected current response threshold, the current is limited to 150 %, typically after 100 ms, the output is electronically shut down (LED of the output is lit red).
- When the output current exceeds the selected current response threshold, and if the supply voltage simultaneously dips below 20 V, then the output is electronically shutdown (the LED of the output is lit red).

Shutdown characteristic 6EP1961-2BA51, -2BA61:

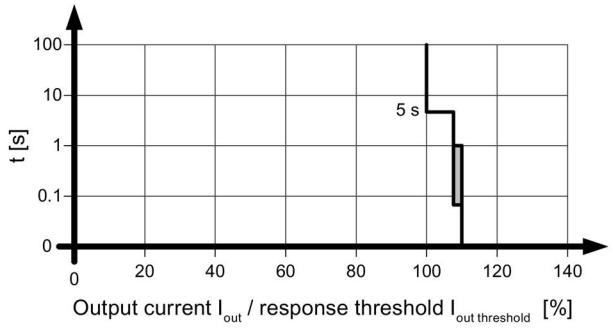

Figure 2-12 Shutdown characteristic 6EP1961-2BA51, -2BA61

- An output current is continuously permissible up to the selected current response threshold (LED of the output is lit green).
- An overload current for 5 seconds is permissible in the range 101 - 109 % of the set current response threshold value (the LED of the output flashes green) - and then the output is electronically shut down (LED of the output is red).
- In the range > 110 % of the selected current response threshold, the current is limited to 110 %, typically after 100 ms, the output is electronically shut down (LED of the output is lit red).
- When the output current exceeds the selected current response threshold, and if the supply voltage simultaneously dips below 20 V, then the output is electronically shutdown (the LED of the output is lit red).

Reset of an electronic overload shutdown using the reset button and remote reset

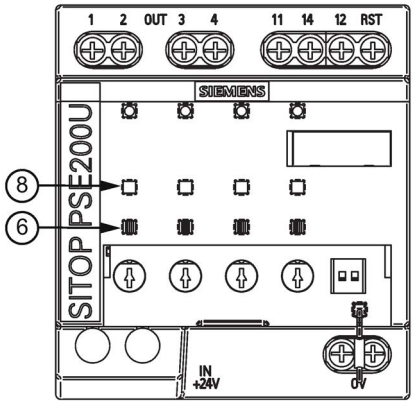

Figure 2-13 SITOP PSE200U button

An individual output can be reset using the button. This resets the electronic shutdown of the output, caused by an overload condition.

The initial situation is an electronic shutdown of individual outputs as a result of an overload condition. This is signaled using the LED ⑧ of the particular output.

LED	Meaning/handling
Lit red	Electronic shutdown as a result of an overload; wait time until a reset is possible: approx. 20 seconds.
Flashes red	Output ready for a reset; press the button to switch-on the output again.
Lit green	The reset was carried out, the output was switched-on again.

Procedure to reset an electronic shutdown:

1. After an electronic shutdown (LED of the output is lit red), allow a wait time of 20 seconds to elapse.
2. Press the reset button ⑥ of the particular output
   Electronic shutdown was reset, and the output has been switched-on again (LED of the output is lit green).

Remote reset:

Alternatively, a remote reset signal can be used. The non-isolated 24 V input (referred to the "0 V" terminal of the module) can be used at terminal "RST". A reset is executed for an input level of > 15 V.

Note

The rising edge of the remote reset signal is evaluated, i.e. for an additional remote reset signal, initially a voltage level of 13 V must be fallen below.

Using a remote reset signal at terminal "RST" all outputs that were shut down electronically due to an overload are reset at this time. Prerequisite: The output is ready to be reset, i.e. the electronic overload shutdown occurred longer than 20 s ago (LED of the output flashes red).

Note

If, after a reset, the cause of the overload is still present, then the output is again automatically shut down. Before carrying out a reset, remove the cause of the overload to prevent a new shutdown.

2.7 Setting the switch-on delay time

For specific loads, it can make sense to sequentially switch-on the outputs in order to reduce the peak inrush currents, and therefore the load on the power supply. To achieve this, the individual outputs of the selectivity module can be switched-in with a time delay between one another in a fixed sequence (output 1 ⇒ 2 ⇒ 3 ⇒ 4). The delay time set between the individual outputs is the same for all of the outputs. When supplied, the delay time is set to 0 ms (all outputs switch on simultaneously).

2.7.1 SITOP select

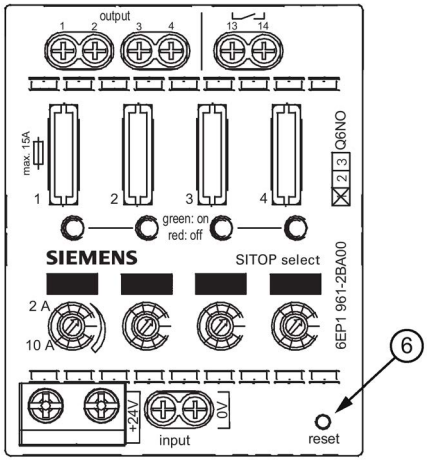

Figure 2-14 Reset button SITOP select

Programming the sequential switch-on delay

For specific loads, it can make sense to sequentially switch-on the outputs in order to reduce the peak inrush currents, and therefore the load on the power supply. To achieve this, the individual outputs of the selectivity module can be switched-in with a time delay between one another in a fixed sequence (output 1 ⇒ 2 ⇒ 3 ⇒ 4). The delay time between the individual outputs is the same for all outputs, and can be set to 0 ms, 24 ms or 100 ms. The selected setting is also kept for an unlimited time even when the power fails, and can be changed as often as required. When supplied, the delay time is set to 0 ms (all outputs switch on simultaneously).

Procedure when setting the delay time:

1. Keep the reset button ⑥ pressed for approximately 8 seconds. The selectivity module changes into the programming mode, all LEDs are lit red and the outputs are shut down.
2. Release the reset button. The LEDs signal the selected delay time using a specific flash rhythm. The meaning is as follows:

LED	Meaning
flash 1x simultaneously red, followed by a 2 s pause	Delay time of 0 ms selected
flash 2x simultaneously red, followed by a 2 s pause	Delay time of 24 ms selected
flash 3x simultaneously red, followed by a 2 s pause	Delay time of 100 ms selected

   The flashing rhythm is repeated after a pause of approx. 2 s.
3. Briefly press the reset button; this causes the actual setting to be moved forward by one stage (0 ms ⇒ 24 ms ⇒ 100 ms ⇒0 ms). Press the reset button several times until the required setting is signaled.
4. Then keep the reset button pressed for approximately 8 seconds. All LEDs light up red.
5. Release the reset button. The selectivity module saves the delay time that has been set and sequentially switches on the outputs.

The LEDs of the outputs are lit green, and the selectivity module is again in its normal operating mode.

Note

In the programming mode, if the reset button is not pressed within 30 s, then the selectivity module automatically returns to the normal operating state without saving any change made to the delay time. The setting is also not saved if, while programming, the supply voltage fails.

Note

The selectivity module outputs are shut down while programming, and are automatically switched-on again after the programming mode is either manually or automatically exited. They are also automatically switched on again after the voltage returns after a power failure!

2.7.2 SITOP PSE200U

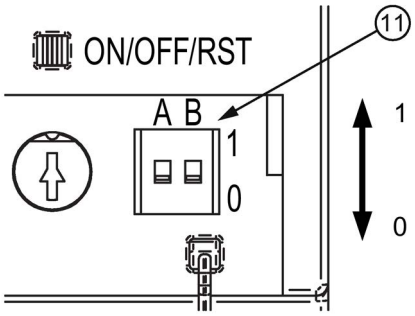

Figure 2-15 SITOP PSE200U selector switch

Setting the sequential switch-on delay

The switch-on delay is set at selector switch ⑪. When delivered, DIP switches "A" and "B" are in position "0" (no switch-on delay).

Procedure when setting the delay time:

With the selectivity module in a no-voltage condition, set DIP switches "A" and "B" to the required delay time.

	No delay, all four outputs are simultaneously switched-on (condition when delivered).
	25 ms delay between the outputs being switched on.
	100 ms delay between the outputs being switched on.
	Outputs switched on depending on the load: The next output is switched on as soon as the current of the previous output lies below the selected response threshold.

The next time that the selectivity module powers up, the outputs are sequentially switched on corresponding to the selected delay time.

Mounting/removal

3

WARNING
Installing the device in a housing or a control cabinet The SITOP select and SITOP PSE200U selectivity modules are built-in units. They must be installed in a housing or control cabinet where only qualified personnel have access.

The device can be mounted in a control cabinet on standard mounting rails (see Chapter Mechanical system (Page 52))

Mounting

To mount the device, position it with the mounting rail guide at the upper edge of the standard mounting rail and press down to lock it into place. If it is too difficult to snap them into place, press slider ① at the same time, as described under "Removal".

Removal

To remove the device, pull slider ① using a screwdriver ② (see Figure 3-1 Mounting/removal (example): 6EP1961-2BA11) (Page 33)) and detach it at the lower edge of the standard mounting rail. Then you can remove the device from the upper edge of the standard mounting rail.

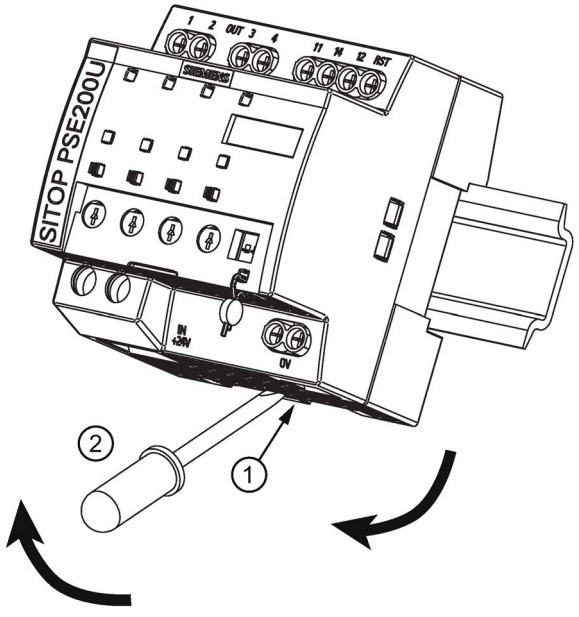

Figure 3-1 Mounting/removal (example): 6EP1961-2BA11)

WARNING

Use in hazardous zones

If the device is installed in a hazardous zone (II 3G Ex nA nC IIC T4 Gc (-2BA11, -2BA21, -2BA51) / II 3G Ex nA IIC T4 Gc (-2BA31, -2BA41, -2BA61)), then it must be installed in a distribution box with degree of protection IP54 or higher.

Mounting position, mounting clearances

4

4.1 Standard mounting position

The device is mounted on standard mounting rails. The device must be mounted vertically in such a way that the input terminals are at the bottom.

A clearance of at least 50 mm should be maintained above and below the device (maximum depth of the cable duct, 50 mm).

No space is required at the side.

Individual output current as a function of the ambient temperature and installation altitude

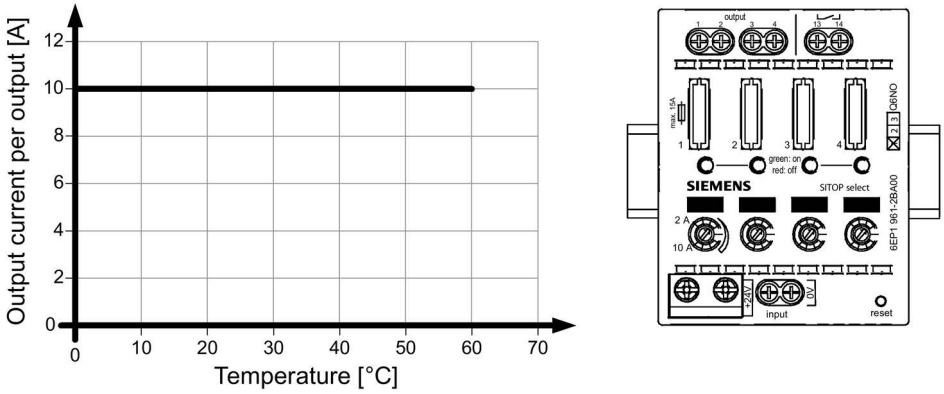

Figure 4-1 6EP1961-2BA00: Output current in the standard mounting position

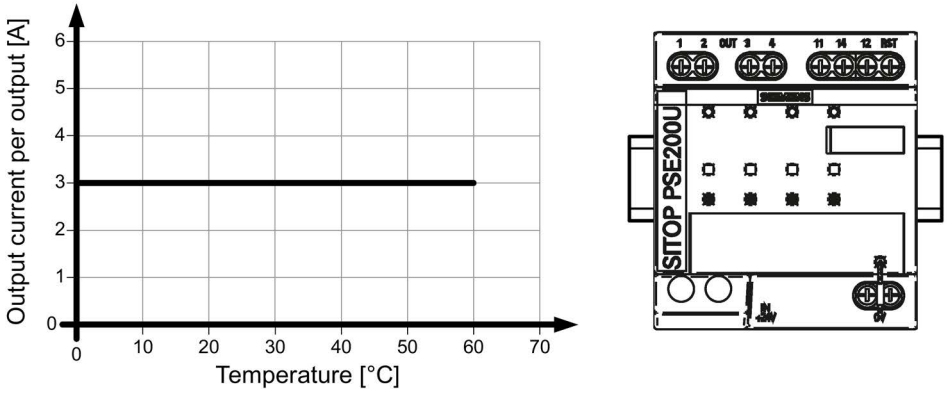

Figure 4-2 6EP1961-2BA11, 6EP1961-2BA31, 6EP1961-2BA51 and 6EP1961-2BA61 output current in the standard mounting position

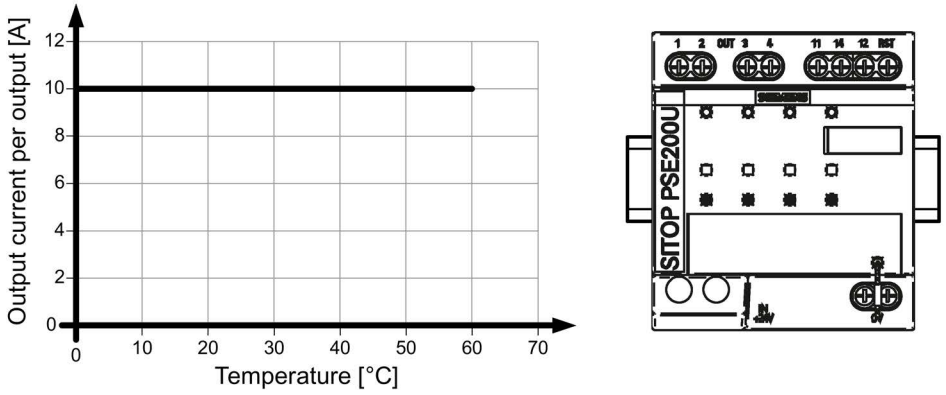

Figure 4-3 6EP1961-2BA21 and 6EP1961-2BA41: Output current in the standard mounting position

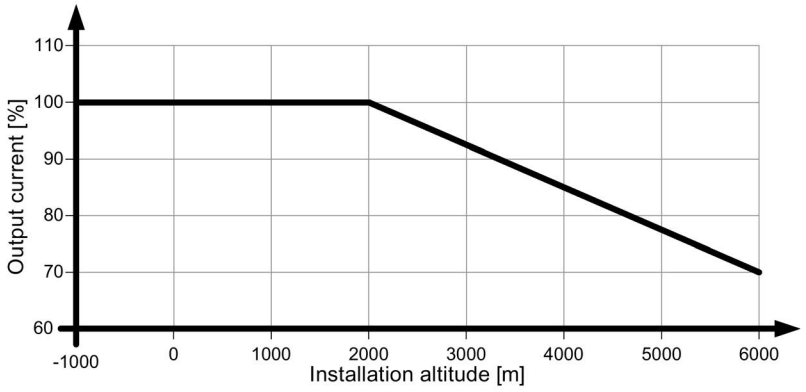

Figure 4-4 Mounting height derating

4.2 Other mounting positions

For mounting positions that deviate from the standard mounting position, derating factors (reduction of the output power or the permissible ambient temperature) must be observed in accordance with the following diagrams.

Note

In the case of mounting positions that deviate from the standard mounting position, reduced mechanical resistance of the devices against vibration and shock must be expected.

Particularly when installing on a vertically fastened standard mounting rail, additional measures may be required, e.g. to prevent the device from slipping on the standard mounting rail.

Installation

5

WARNING

Hazard due to electric shock

Before installation or maintenance work can begin, the system's main switch must be switched off and measures taken to prevent it being switched on again. If this instruction is not observed, touching live parts can result in death or serious injury.

5.1 Input side connection

WARNING

The device is only suitable for operation with **24 V DC voltages** (safety extra low voltage). If this device is connected to line supplies with higher voltage levels this can result in death or serious injury as well as extensive material damage.

Only appropriately qualified personnel may work on or in the vicinity of this equipment. Perfect, safe, and reliable operation of this equipment is dependent on proper transportation, storage, installation and mounting.

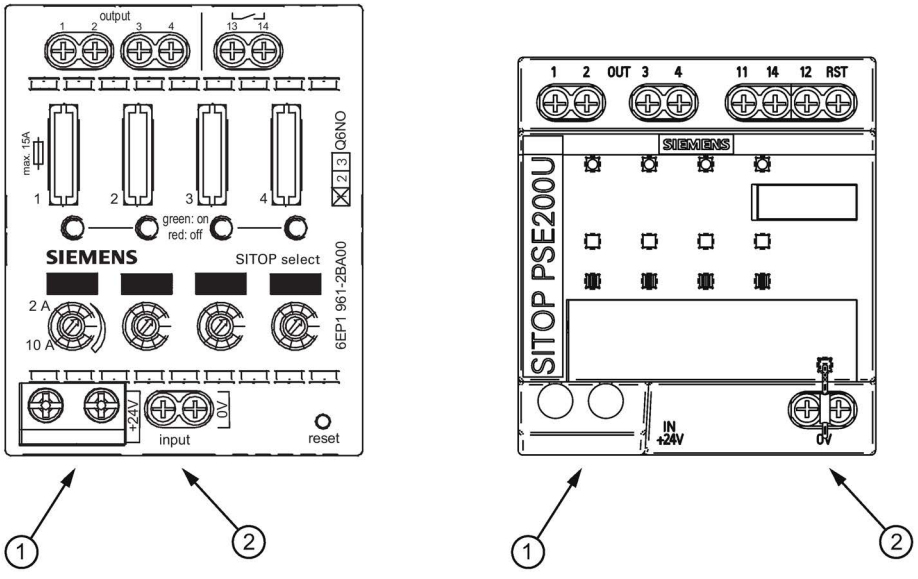

Figure 5-1 Input connection

The supply is connected via input terminal ①, designated "24 V" and the 0 V terminal ②, designated "0 V"; the "0 V" connection is not used for the load supply, but only to supply the internal electronics of the selectivity module (terminal cross-sections, see Figure 2-2 Terminal data (Page 13)).

NOTICE

Overload of the wiring

The "0 V" connection is only used to supply the internal electronics of the selectivity module. The 0 V of the connected loads must be routed directly to the power supply using separate cables!

NOTICE

Overload of the wiring

The input terminals of the selectivity module are designed for a maximum input current of 40 A. This must be taken into account when connecting several selectivity modules in parallel using "loop through". If the total current demand of all selectivity modules connected in parallel is more than 40 A, then the maximum current should be reduced to 40 A per branch by using additional feeder cables directly from the power supply to the selectivity modules connected in parallel.

5.2 Output-side connection

(see Chapter Technical data (Page 47))

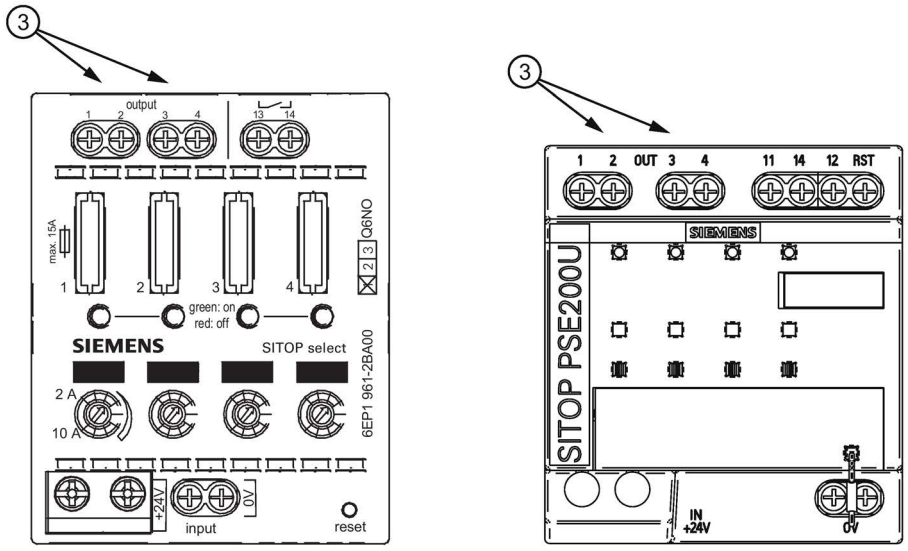

Figure 5-2 Output connection

The load to be supplied is connected through output terminals ③ labeled OUT 1, 2, 3, 4. (terminal cross-sections, see Figure Terminal data (Page 13)).

Note

The 0 V of the loads must be routed directly to the power supply using separate cables!

Technical data

6

Note

Technical data apply for a rated input voltage, rated load and 25 °C ambient temperature if nothing else is specified.

6.1 Input

	6EP1961-2BA00	6EP1961-2BA11 6EP1961-2BA31 6EP1961-2BA51 6EP1961-2BA61	6EP1961-2BA21 6EP1961-2BA41

Number of outputs	4	4	4
Output current up to 60 °C for each output (rated value)	10 A	3 A	10 A

	6EP1961-2BA00	6EP1961-2BA11 6EP1961-2BA31 6EP1961-2BA51 6EP1961-2BA61	6EP1961-2BA21 6EP1961-2BA41
Adjustable response threshold	2 - 10 A	0.5 - 3 A	3 - 10 A
Connecting outputs in parallel	No	No	No
Switching on outputs	All outputs are simultaneously switch on after the supply voltage has ramped up, delay time of 24 ms or 100 ms can be programmed for outputs to be sequentially switched on.	All outputs are simultaneously switched-on after the supply voltage ramps up > 20 V, delay time of 25 ms, 100 ms – or "load optimized" where the outputs are sequentially switched-on, selected using the DIP switch.	

Shutdown characteristics SITOP select:

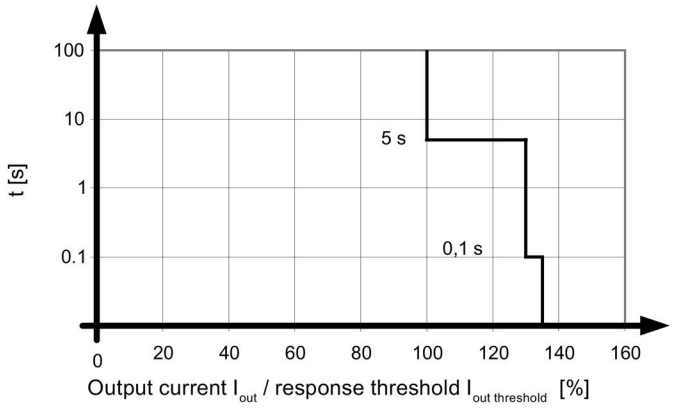

Figure 6-1 Shutdown characteristic SITOP select

- An output current is continuously permissible up to the selected current response threshold.
- In the range 101 - 129 % of the selected current response threshold, an overload current is permissible for 5 seconds; after this time, the output is electronically shut down.
- In the range > 130 % of the selected current response threshold, the current is limited to 130 %; after approximately 50 - 100 ms, the output is electronically shut down.
- When the output current exceeds the selected current response threshold, and if the supply voltage simultaneously dips below 20 V, then the output is electronically shutdown.

Shutdown characteristics SITOP PSE200U (with the exception of -2BA51, -2BA61) product version 1:

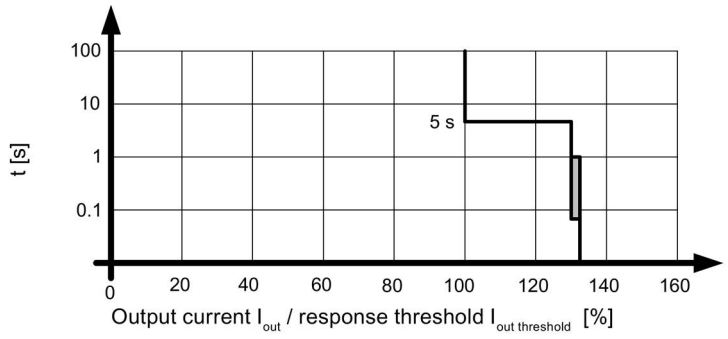

Figure 6-2 Shutdown characteristics SITOP PSE200U (product version 1)

- An output current is continuously permissible up to the selected current response threshold.
- In the range 101 - 129 % of the selected current response threshold, an overload current is permissible for 5 seconds; after this time, the output is electronically shut down.
- In the range > 130 % of the selected current response threshold, the current is limited to 130 %; typically after 100 ms the output is electronically shut down.
- When the output current exceeds the selected current response threshold, and if the supply voltage simultaneously dips below 20 V, then the output is electronically shutdown.

Shutdown characteristics SITOP PSE200U (with the exception of -2BA51, -2BA61) from product version 2 and higher:

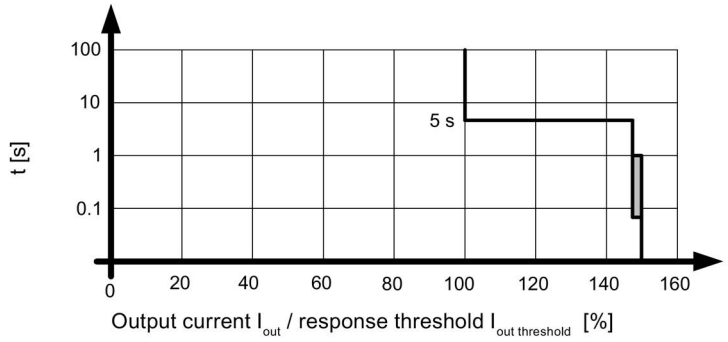

Figure 6-3 Shutdown characteristics SITOP PSE200U (from product version 2 and higher)

- An output current is continuously permissible up to the selected current response threshold.
- In the range 101 - 149 % of the selected current response threshold, an overload current is permissible for 5 seconds; after this time, the output is electronically shut down.

- In the range > 150 % of the selected current response threshold, the current is limited to 150 %; typically after 100 ms the output is electronically shut down.
- When the output current exceeds the selected current response threshold, and if the supply voltage simultaneously dips below 20 V, then the output is electronically shutdown.

Shutdown characteristic 6EP1961-2BA51, -2BA61:

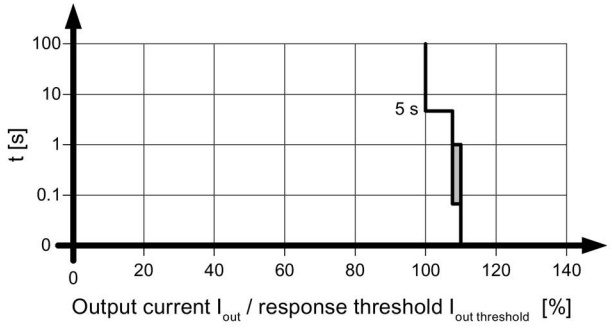

Figure 6-4 Shutdown characteristic 6EP1961-2BA51, -2BA61

- An output current is continuously permissible up to the selected current response threshold (LED of the output is lit green).
- In the range 101 - 109 % of the selected current response threshold, an overload current is permissible for 5 seconds (LED of the output flashes green), then the output is electronically shut down (LED of the output is lit red).
- In the range > 110 % of the selected current response threshold, the current is limited to 110 %, typically after 100 ms, the output is electronically shut down (LED of the output is lit red).
- When the output current exceeds the selected current response threshold, and if the supply voltage simultaneously dips below 20 V, then the output is electronically shutdown (the LED of the output is lit red).

6.3 Efficiency

	6EP1961-2BA00	6EP1961-2BA11 6EP1961-2BA31 6EP1961-2BA51 6EP1961-2BA61	6EP1961-2BA21 6EP1961-2BA41
Efficiency at $U_{out\ rated}$, $I_{out\ rated}$, approx.	97 %	97 %	99 %
Power loss at $U_{out\ rated}$, $I_{out\ rated}$, approx.	30 W	9 W	10 W

6.4 Protection and monitoring

	6EP1961-2BA00	6EP1961-2BA11 6EP1961-2BA51	6EP1961-2BA21	6EP1961-2BA31 6EP1961-2BA61	6EP1961-2BA41
Device protection	Flat fuse for each output (a 15 A fuse is inserted when the device is shipped) [1*)]	Internal fuse 5 A for each output (not accessible)	Internal fuse 15 A for each output (not accessible)	Internal fuse 5 A for each output (not accessible)	Internal fuse 15 A for each output (not accessible)
Operating display	One LED per output: Green LED for "Output switched through", red LED for "Output shutdown due to overcurrent"	One LED per output: Green LED for "Output switched through", orange LED for "Output manually switched off", red LED for "Output shutdown due to overcurrent".			
Signaling	Group signaling contact (NO contact, contact rating 0.5 A/24 V)	Group signaling contact (changeover contact, contact rating 0.1 A/24 V)		Status signal output (pulse position signal that can be evaluated using a Simatic function block)	

[1*)] Note for 6EP1961-2BA00:
When required, depending on the potentiometer setting, lower fuse values can be selected.
Setting to → fuse from
2 A → 3 A
3 A → 4 A
4 A → 5 A
6 A → 7.5 A
8 A → 10 A
10 A → 15 A

6.5 MTBF

	6EP1961-2BA00 6EP1961-2BA11 6EP1961-2BA21	6EP1961-2BA31 6EP1961-2BA41	6EP1961-2BA51 6EP1961-2BA61
Mean Time Between Failures	> 500,000 hours at 40 °C, rated load, 24 hour operation		

6.6 Mechanical system

	6EP1961-2BA00	6EP1961-2BA11 6EP1961-2BA21 6EP1961-2BA51	6EP1961-2BA31 6EP1961-2BA41 6EP1961-2BA61
Connection system	Screw connection	Screw connection	Screw connection
+24 V input	2 screw terminals for 0.5 - 16 mm²	2 screw terminals for 0.5 - 16 mm²	2 screw terminals for 0.5 - 16 mm²
0 V connection	2 screw terminals for 0.2 - 6 (4) mm² solid (finely stranded)	2 screw terminals for 0.2 - 6 (4) mm² solid (finely stranded)	2 screw terminals for 0.2 - 6 (4) mm² solid (finely stranded)
Output 1, 2, 3, 4	One screw-type terminal for each output for 0.2 - 6 (4) mm² solid (finely stranded)	One screw-type terminal for each output for 0.2 - 6 (4) mm² solid (finely stranded)	One screw-type terminal for each output for 0.2 - 6 (4) mm² solid (finely stranded)
Group signal contact	2 screw terminals for 0.2 - 6 (4) mm² solid (finely stranded)	3 screw terminals for 0.2 - 6 (4) mm² solid (finely stranded)	-
Status output	-	-	One screw terminal for 0.2 - 6 (4) mm² solid (finely stranded)
Remote reset	-	One screw terminal for 0.2 - 6 (4) mm² solid (finely stranded)	One screw terminal for 0.2 - 6 (4) mm² solid (finely stranded)
Width of the housing	72 mm	72 mm	72 mm
Height of the housing	90 mm	80 mm	80 mm
Depth of the housing	approx. 90 mm	72 mm	72 mm
Installation width	72 mm	72 mm	72 mm
Mounting height	190 mm	180 mm	180 mm
Weight, approx.	0.4 kg	0.2 kg	0.2 kg
Mounting	Can be snapped onto standard TH35-15/7,5 mounting rails (EN 60715)

Marine approvals	-	DNV-GL, ABS	DNV-GL, ABS

7.3 EMC

	6EP1961-2BA00 6EP1961-2BA11 6EP1961-2BA21	6EP1961-2BA31 6EP1961-2BA41	6EP1961-2BA51 6EP1961-2BA61
Emitted interference	EN 55022 Class B		
Noise immunity	EN 61000-6-2		

Environmental conditions

8

	6EP1961-2BA00 6EP1961-2BA11 6EP1961-2BA21	6EP1961-2BA31 6EP1961-2BA41	6EP1961-2BA51 6EP1961-2BA61
Ambient temperature	-25 … 60 °C for natural convection		
	Tested according to: • EN 60068-2-1 cold • EN 60068-2-2 dry heat • EN 60068-2-78 humid heat, constant • EN 60068-2-14 temperature change		
Transport and storage temperature	-40 … 85 °C Tests (packed for shipping) according to: • EN 60068-2-1 cold • EN 60068-2-2 dry heat • EN 60068-2-30 humid heat, cyclic		
Humidity class	Climatic class 3K3 according to EN 60721, 5 - 95 % no condensation		
Degree of pollution	2		
Mechanical stressing in operation	• Tested according to EN 60068-2-6 vibration, test Fc:		
	3.5 mm deflection in the range 5 - 8.4 Hz 2 g acceleration in the range 8.4 - 150 Hz		
	• Tested according to EN 60068-2-27 shock, test Ea: acceleration 150 m/s², test duration 11 ms		
Damaging gases	Tested according to: • EN 60068-2-42 sulfur dioxide • EN 60068-2-43 hydrogen sulfide		
Atmospheric pressure	Operation: • 1080 - 795 hPa (-1000 - 2000 m) • For operation at altitudes of 2000 - 6000 m above sea level: output must be derated by -7.5% / 1000 m or the ambient temperature must be reduced by 5 K / 1000 m (see Figure 4-4 Mounting height derating (Page 36)) Storage: • 1080 - 660 hPa (-1000 - 3500 m)		

Environment

9

The devices are in conformance with RoHS.

As a rule, only non-silicon precipitating materials are used.

Disposal guidelines

Packaging and packaging aids can and should always be recycled. The product itself may not be disposed of as domestic refuse.

Service & Support

10

Technical support

Technical support for all IA/DT products can be accessed through the following communication channels:

- Telephone: + 49 (0) 911 895 7222
- Internet:
  Web form for support request (http://www.siemens.de/automation/support-request)

Technical documentation on the Internet

Operating instructions and manuals for SITOP are available in the Internet:
Operating instructions/manuals (http://www.siemens.com/sitop/manuals)

SITOP power supply homepage

General news about our power supplies is available in the Internet at the SITOP home page:
SITOP (http://www.siemens.com/sitop)

Information material

SITOP information can be downloaded from the Internet:
Information and download center (http://www.siemens.com/sitop-infomaterial)

CAx data

2D/3D data and circuit diagram macros can be downloaded from the Internet:
Siemens image database (http://www.siemens.com/sitop-cax)

Request all CAx data via the CAx download manager:
CAx shopping cart (http://www.siemens.com/cax)

SITOP Selection Tool

Simply and quickly select the optimum the power supply or DC-UPS:
SITOP Selection Tool (http://www.siemens.com/sitop-selection-tool)

Online catalog and ordering system

The online catalog and the online ordering system are available through the Industry Mall homepage:
Industry Mall (http://www.siemens.com/industrymall/de)

Contact persons

If you have any questions regarding the use of our products, then contact the Siemens contact person in your regional Siemens sales office.

You can find these addresses as follows:

- On the Internet (http://www.automation.siemens.com/partner)
- Industry Mall (http://www.siemens.com/industrymall/de)

EG-Konformitätserklärung
EC Declaration of Conformity

Nr. Select-A1-3

Hersteller: *Manufacturer:*	Siemens Aktiengesellschaft Österreich Siemens Industrial Manufacturing, Engineering and Applications (SIMEA)
Anschrift: *Address:*	Siemensstraße 90 1210 Wien, Österreich
Produkt-bezeichnung: *Productdescription*	SITOP Stromversorgung / power supply PSE200U 6EP1961-2BA10, 6EP1961-2BA11, 6EP1961-2BA31, 6EP1961-2BA51 6EP1961-2BA20, 6EP1961-2BA21, 6EP1961-2BA41, 6EP1961-2BA61

Das bezeichnete Produkt stimmt in der von uns in Verkehr gebrachten Ausführung mit den Vorschriften folgender Europäischer Richtlinien überein:
The product described above in the form as delivered is in conformity with the provisions of the following European Directives:

2014/30/EU Richtlinie des europäischen Parlaments und des Rates zur Harmonisierung der Rechtsvorschriften der Mitgliedsstaaten über die Elektromagnetische Verträglichkeit.
Directive of the European Parliament and of the council on the harmonisation of the laws of the Member States relating to electromagnetic compatibility

2011/65/EU RICHTLINIE DES EUROPÄISCHEN PARLAMENTS UND DES RATES vom 8. Juni 2011 zur Beschränkung der Verwendung bestimmter gefährlicher Stoffe in Elektro – und Elektronikgeräten
DIRECTIVE OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 8 June 2011 on the restriction of the use of certain hazardous substances in electrical and electronic equipment

Die Konformität mit den Richtlinien wird nachgewiesen durch die Einhaltung folgender Normen:
Conformity to the Directives is assured through the application of the following standards:

Referenznummer Reference number	Ausgabedatum Date of issue
EN 61000-6-2	2005
EN 61000-6-3	2007+A1:2011

Diese Erklärung bescheinigt die Übereinstimmung mit den genannten Richtlinien, ist jedoch keine Beschaffenheits- oder Haltbarkeitsgarantie. Die Sicherheitshinweise der mitgelieferten Produktdokumentation sind zu beachten.
This declaration certifies the conformity to the specified directives but contains no assurance of properties. The safety documentation accompanying the product shall be considered in detail.

SIEMENS

Anhang EX zur EG-Konformitätserklärung
Annex EX to the EC - Declaration of Conformity

Nr. Select-A1-3

Produktbezeichnung: SITOP Stromversorgung / power supply PSE200U
6EP1961-2BA10, 6EP1961-2BA11, 6EP1961-2BA31, 6EP1961-2BA51
6EP1961-2BA20, 6EP1961-2BA21, 6EP1961-2BA41, 6EP1961-2BA61

Die Übereinstimmung des bezeichneten Produkts mit den Vorschriften der Richtlinie 2014/34/EU wird nachgewiesen durch die vollständige Einhaltung folgender Normen:
The conformity of the designated product with the provisions of Directive 2014/34/EU is proved by full compliance with the following standards:

Harmonisierte Europäische Normen:
Harmonised European standards:

Referenznummer Reference number	Ausgabedatum Date of issue	Referenznummer Reference number	Ausgabedatum Date of issue

Name der zertifizierten Prüfstelle:
Bureau Veritas Consumer Product Services Germany GmbH
Business Park A96
D-86842 Türkheim
Germany

Zertifikat Nr: EPS 09 ATEX 1 169 X

Besondere Bedingungen / special conditions:

1) Die Stromversorgung ist in einem geeigneten Übergehäuse mit einem Schutzgrad von min. IP54 zu installieren, welches die Umgebungsbedingungen unter denen das Produkt betrieben wird, berücksichtigt.
The power supply types shall be installed in a suitable enclosure with a degree of protection of min. IP 54 taking into account, the environmental conditions under which the equipment will be used.

2) An den Ausgangsstromkreis dürfen nur Geräte angeschlossen werden, welche für den Betrieb in explosionsgefährdeten Bereichen der Zone 2 und die am Einsatzort vorliegenden Bedingungen geeignet sind.
Devices connected to the output shall be suitable for utilization in potentially explosive atmospheres of zone 2 as well as for the conditions at the field installation.

3) Vor Öffnen des umgebenden Schaltschrankes muss die Versorgungsspannung des Gerätes unterbrochen sein.
Before opening the enclosure the supply voltage of the device has to be disconnecte

4) Die zulässige Umgebungstemperatur beträgt -25° bis +60°C (70°C mit Derating).
The max. ambient range is: -25°...+60°C (70°C with derating)

EU-Konformitätserklärung Nr. 2320296.CE.04
EU-Declaration of Conformity No.

Hersteller / *Manufacturer*: **PHOENIX CONTACT GMBH & CO. KG**
